Sanderson & Son, Inc., agents of the Royal Mail Steam Packet Company, announce that the steamship "Ohio," newest and speediest of the Company's famous "O" fleet of liners, is to be converted into a one-cabin ship beginning with her voyage from New York on April 19 next. Heretofore, the "Ohio" has been operated as a regular three-class vessel. Her conversion gives the Company four ships of the one-cabin type, the "Ohio," "Orca," "Orduna," and "Orbita," all operating in New York-Cherbourg - Southampton - Hamburg passenger service.

With C. & N. W. 56 Years

William R. Morgan, Station Master at the Chicago & North Western Terminal, Chicago, the oldest of the road's employes, recently celebrated his fifty-sixth year of service with that road. Mr. Morgan is the veteran around whom the Northwestern built the personal features of its seventieth anniversary celebration last October.

Pennsy Orders 12,000 Freight Cars

Announcement that the Pennsylvania Railroad System has just placed orders for the purchase of 11,000 freight cars, and is negotiating for the purchase of 1,000 more, making a total of 12,000 new cars, all to be delivered as soon as the equipment companies can complete their construction, is made by Vice-President E. T. Whiter. The 12,000 cars consist of 3,000 all steel automobile cars, 8,000 all steel box cars and 1,000 steel under-frame stock cars. The automobiles and box cars have been contracted for, and the stock cars are still under negotiation.

"Homeseeker" Rates on Sale

"Homeseeker" rates for 1924 to Northwest points are now in force on the Northern Pacific Railroad. Round trip tickets are sold to land seekers for one fare, plus $2. The tickets are on sale the first and third Tuesdays of each month, March to November, at the ticket offices in St. Paul, Duluth, Superior and points East.

Your Time Is Money

Your freight shipments have often been delayed more between your doors and the freight stations than on the railroad.

Quick and careful freight house trucking is our specialty.

Perhaps the operation of your own trucks runs your trucking costs too high.

We can do your trucking cheaper and quicker than you can—that is our business.

Perhaps your trucking demands come only at certain intervals.

Tell us your requirements and let us submit our estimate for your trucking.

Perhaps your neighborhood can support a regular trucking service.

Let us study your needs and submit a schedule to care for your neighborhood trucking.

Perhaps you require fast and safe suburban and interurban service.

Our despatcher can give you a schedule as exact as a railroad time card.

We have 75 trucks from 1 to 7 tons capacity in perfect running order day and night.

Let us help you save your money.

FOREIGN TRADE

World Motor Transport Congress, to Be Held at Detroit In May, Will Study Benefits of Motor Car to Mankind

TO create through co-operative helpfulness of all countries a better appreciation of the economic progress contributed by the motor vehicle, and to pro- e international understanding of factors which depends the achievement of a mo- ized world with its resultant benefits to .nkind,"—such is the mission imposed the World Motor Transport Congress, be held in Detroit, May 21-24, 1924, der the auspices of the National Auto- ıbile Chamber of Commerce. Every nation in the world which is interested in the automobile has been invited to send representatives, and the Congress is expected to be one of the most important international events of many years.

Five of the most important automotive associations in the United States have joined with the National Automobile Chamber of Commerce in the conduct of this Congress. They are:

The Motor & Accessory Manufacturers' Association, the Society of Automotive Engineers, the National Autombile Dealers' Association, the Automotive Equipment Association and the Service Equipment Association.

The Service Committee of the National Automobile Chamber of Commerce, which originated the Congress, consists of Frank A. Bonham, Durant, Chairman; W. M. Warner, Cadillac; A. R. Cumner, Autocar; L. C. Voyles, Marmon; F. J. Wells, Pierce-Arrow; H. R. Cobleigh, of The National Automobile Chamber of Commerce.

S. A. Miles, Manager of the New York and Chicago National Automobile Shows, will be the Chairman and Manager of the Service Show which will be held in conjunction with the Congress. The latter will be held in the Hotel Statler, while the show will be held in the General Motors Building.

Much interest in the Congress has been shown in many foreign countries, according to reports to the National Chamber headquarters in New York. The Department of Commerce has recently advised the sponsors for the Congress that German automobile dealers will be officially represented through officers of the German Automobile Dealers' Association, which will send its General Director, Herr Johannes Buschmann, and seven members to America early in May, to represent the Association. The delegation plans also to spend three weeks investigating the following subjects: production plants, assembling methods, repair service, distribution and sales practices, advertising, disposal of used cars, storage practice, installment payments, automobile insurance, licenses, taxes and traffic regulations.

Seeks Galena Market In U. S.

South Africa producers of galena (native lead sulphide, the chief ore of lead) are seeking a market in the United States for their product and have appealed to the Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce, for assistance. According to statements made by these mine owners to the Government, they hold mining rights over certain properties in South Africa from which they are producing this mineral in fair quantities. At present they can supply approximately 100 tons per month, but they hope to develop this property until a much larger quantity can be turned out.

American manufacturers interested in this product may obtain further information, with the names of the South African owners and their address, upon request to MANUFACTURERS NEWS.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

BRAZIL—9625, fruits—apples, pears, grapes.

BULGARIA—9576, acetic acid; glucose; sulphuric acid; sugar.

CANADA—9624, lights, gasoline, for streets.

CHILE—9601, supplies for making vanity bags and novelties.

CHINA—9591, agricultural implements; 9617, canvas; electrical fans, irons, heaters, telephones, flashlights, and batteries; 9591, electrical goods; 9617, electrical accessories, such as rubber insulated wire, flexible lamp cord, electric meters, and tumbler switches; 9591, fertilizers; hardware; mechanical tools; small machinery; 9617, newspapers, old; sulphate of ammonia.

CUBA—9555, tractor wheels, stump pullers. locomotive attachments, and disc plows and harrows; truck bodies, one-ton, knocked-down, and unpainted.

DENMARK—9596, bichromate of soda and potash; 9605, lighting fixtures, glass and porcelain, for use of kerosene; 9596, paints; rosin; turpentine; varnishes.

ENGLAND—9599, balloons, toy, 5,000 gross; 9623, cement, pure white, best quality; 9620, chemicals; drugs, crude and refined; medicinal preparations; oils, essential; 9579, petrolatum; 9620, pharmaceuticals; waxes.

FRANCE—9609, railway track, portable, with steel flanged rails, fishplates, fishbolts, etc.

GERMANY—9595, automobiles; 9527, automobiles; 9529, automobiles; 9539, automobiles; 9541, automobiles; 9542, automobiles; 9537, automobiles; 9532, automobiles, low-priced; 9538, automobiles, medium-priced; 9544, automobiles, small; 9530, automobiles; automobile accessories; 9533, automobiles; automobile accessories; 9536, automobiles; automobile accessories; 9547, automobiles; 9529, automobiles, low-priced; 9575, bacon; cereals; corned beef; 9530, chassis for automobiles and trucks; 9575, flour; lard; milk; provisions; 9621, pianos, all styles; pianos, player, cheap and medium-priced; 9529, motorcycles, low-priced; 9547, motorcycles, 9525, trucks, motor; 9532, trucks, motor; 9547, trucks, motor; 9557, tractors, light, for agriculture, logging, and other operations; 9615, wire, chrome nickel resistance; 9557, harvesting machinery; 9579, shoe accessories of all kinds; 9598, shoes, rubber, of superior quality for men, women, and children; 9598, heels—black, brown, and red.

HUNGARY—9612, machinery for manufacturing needles, safety pins, paper clips, etc., electrically driven; wire for manufacture of pins and safety pins.

INDIA—9585, cotton piece-goods, staple and fancy; piece-goods remnants; 9610, ropes and twine; textile mill stores, such as shuttles, bobbins, card cans, card clothing, headles, reeds, sizing flannel, clearer cloths, casing papers, straw boards, tallow sizing, ingredients, and machinery spares; leather goods for textile mills.

IRELAND—9630, cutlery—table, grinding and finishing plant for products of; 9619, electrical equipment for automobiles; electrical novelties, especially sign equipment; 9621, radio receiving sets, 2, 3, and 4 valve, and parts and accessories; 9626, radio receiving sets, 2, 3, and 4 valve, and parts and accessories; 9627, radio receiving sets, 2, 3, and 4 valve, and parts and accessories; 9619, radio supplies; wire; wiring supplies.

ITALY—9622, agricultural implements; 9554, aluminum in bars, sheets, and tubes; 9629, machinery for manufacturing steel filings from steel blocks; 9622, machinery and implements, industrial; 9556, lawnmowers.

JAVA—9577, Virginia leaf tobacco.

MESOPOTAMIA—9606, barbers' supplies including razors, combs, and shears.

PANAMA REPUBLIC—9628, brooms; brushes; books; bulbs, electrical; clocks, office; dusters; oil, typewriter; oil, floor; office supplies; pencils; pens; paper for sanitary drinking cups and towels; soap; toilet paper.

SWEDEN—9595, ferro-cerum in levigated form; 9580, oils, lubricating; 9594, superphosphates in shipload-lots; 9607, wooden pegs for shoes.

VANCOUVER—9584, jute, waste, clean and dry.

WALES—9569, bacon; canned goods; hams.

SALES MANAGEMENT

Chief Business Functions Are to Render Service to Customers and Make Profit for Investor, Says Speaker

"THREE times as many people are in the automobile business as manufacturers, dealers and salesmen as there is any economic demand for, and the result was that one-third of the dealers of 1923 failed in business."

This was the statement of J. S. Knox. President of the Knox School of Salesmanship and Business Administration of Cleveland, O., in a recent address before the Executives' Club of Chicago.

"The salesmanship that is needed," which was Mr. Knox's subject, "is a practice of the ability to demonstrate the utility of a product to the consumer so that the consumer can get the greatest possible value out of the purchased article or articles.

"For 500 years our schools have given a classical education, and when the invention of the spinning jenny occurred in 1764, school teachers made no change in methods. As much progress has been made in the past 150 years as that made in the previous 160,000 years. Other inventions which laid the foundation for our commercial and industrial age are the steam engine in 1772, malleable iron in 1784, the cotton gin in 1792, the steamboat in 1807, and the railroad in 1814.

"These six basic inventions were opposed by the public, as all new ideas are opposed and always will be, until understood. This gave rise to the need of technically trained workers, and the schools did not give that education. School people did not comprehend the need, therefore opposed, and still oppose, technical education. Schools today are at least twenty-five years behind the times.

"Inventions gave rise to two kinds of people—inventors and salesmen. Whenever an inventor saw a public need, he tried to fill it. Salesmen take the invention to the unwilling public, demonstrate its values, and after much continued effort, make sales. After much demonstration and education, the public is reluctantly convinced and proceeds to purchase necessities quite nonchalantly.

"The railroads gave rise to the need of schools of engineering, accountancy, finance, and management. The automobile revolutionized individual transportation. Fifty-one years ago there were no typewriters, adding machines, cash registers, telephones or automobiles. We are living so fast today, in such a complex civilization, that mortals must *think* if they would survive. Time was, in George Washington's era, that people could make a living without much thinking, but not so today; a man must think much in a little field in order to become continuously useful in a business.

"Business exists for two reasons only—to render a necessary service to the customer, and to make profits for the investors. In order to survive, commercial institutions need technically skilled employes. In this day and age, when there are more automobiles (15,000,000 resulting in an annual business of $8,000,000,000 in cars and accessories) than telephones, it is highly essential that people think in modern terms with technical accuracy. In 1896 there were but three gasoline engines in the United States, and most of our schools are operating under methods almost as ancient. We have passed through three industrial commercial phases—engineering, production, and merchandising. We have solved the first two, and are being overcome by the third.

"The salesmanship that counts is the salesmanship that serves—serves people constructively and serves business profitably.

"The chief functions of business are to render service to customers and to pay a profit to investors. Statistics tell us that 80 per cent of our business men fail in business. So the important problems of today are to learn how to invest and how to make a profit."

Schools for Auto Salesmen

The Empire State Automobile Merchants Association is organizing an elaborate system of schools for salesmen to be conducted during the month of April. Schools will be conducted in New York, Brooklyn, Albany, Utica, Syracuse, Rochester, Buffalo, Elmira and Binghamton. They will be carried on in the evenings so that dealers in territory surrounding the point at which the instructions will be given may send their salesmen without interfering with their daily routine.

Many Raw Materials Used In U. S. Controlled Abroad

Nine raw materials essential to American industry and agriculture, whose principal production sources are abroad, are controlled in greater or less degree by combinations of foreign producing organizations, Secretary Hoover recently wrote to Senator Capper of Kansas.

The nine raw materials mentioned are: Sisal for binding twine, controlled by Yucatan; nitrates and iodine, controlled by the British and Chile; potash, controlled by German producers; crude rubber and gutta-percha, by producers in British and Dutch colonies; quinine, by a combination of Dutch producers; tin by British producers; mercury by Spanish and Austrian mine owners; coffee by Brazil; quebracho (for tanning purposes) by a combination of producers and foreign manufacturers.

"The value of our total imports of the above in 1923 exceeded $525,000,000 and prices are undoubtedly much higher than otherwise would be the case," concluded Secretary Hoover's letter.

167 Lbs. of Meat Is 1923 Per Capita Record In U. S.

The "helpings" of meat on American tables were larger in 1923 than in any other year of the past fifteen, according to estimates published by the Bureau of Animal Industry of the United States Department of Agriculture. The greatest increase was in the use of pork, but there was some increase in the consumption of all other kinds of meat. The production and consumption for the year was the greatest in our history, though the consumption per head of the population was exceeded once, in 1908, when the figure was 170.9 pounds as compared with 167.0 pounds in 1923.

The total quantity of meat consumed in the United States in 1923 was 18,481,000,000 pounds—6,918,000,000 of beef, 873,000,000 veal, 574,000,000 mutton and lamb, 3,000,000 goat, and 10,113,000,000 pork—an increase of over 2,000,000,000 pounds over the average of the last 5 years and the per capita increase is 18 pounds.

The following table shows how much of these various products are eaten by each person in the United States:

	1921 Pounds	1922 Pounds	1923 Pound
Beef	57.8	61.4	62.
Veal	7.0	7.3	7.
Mutton and lamb	6.2	5.0	5.
Pork (excluding lard)	72.9	76.0	91.4
Total meat	143.9	149.7	167.

Metal Trades Assn. to Meet

The annual convention of the National Metal Trades Association will be held in New York April 23 and 24. William O. Coleman is President of the Association.

Headquarters

Is it some heavy timbers you need? Something about 30x30, and 120 feet long? Or piling up to 80 foot lengths? Perhaps just some crating lumber? Whatever it is, in any wood, size or amount, we can fill your order with no delay.

Our stocks of some 75 million feet in our Chicago yard of 45 acres are constantly maintained by our own mills operating in our own forests. Unequaled railroad facilities and a mile of waterfront give us shipping accommodations without equal.

In Chicago and suburbs, our own twenty branch yards mean quick deliveries and smaller delivery costs.

Wire us, phone us, write for anything any time. Our facilities make us national headquarters for lumber.

AUTOMOBILE—AVIATION

World Production of Auto and Motorcycle Tires Estimated At 54,520,000—U. S. Exported 1,362,741 Last Year

DURING 1923, the production of casings for motor cars and motor cycles in the principal tire manufacturing countries of the world reached an estimated total of 54,520,000, the United States, which has 80 per cent of the world's automobiles within its borders, producing about 46,000,000, according to Government statistics compiled by the Rubber Division of the Department of Commerce.

The total exports of automobile and motor cycle casings from the leading tire manufacturing countries is estimated as 4,638,000 in 1923, compared with 3,961,000 in 1922. The United States' exports of automobile casings numbered 1,325,753 in 1922, and increased to 1,362,741 in 1923, but the percentage of the total export trade supplied by the United States declined from 33.5 per cent in 1922 to 29.4 per cent in 1923. Although the United States did this very creditable share of the export tire trade of the world in 1923, the number of automobile casings shipped abroad was only about 3 per cent of the tire production of the country. The answer lies in the fact that there are more than 13,200,000 passenger automobiles in the United States while all the rest of the world has only about 2,280,000.

As contrasted with the American tire industry with its 1923 production of 46,000,000 casings and exports of 1,362,741, foreign manufacturers are estimated to have produced 8,520,000 casings for motor cars and motor cycles during 1923, and to have exported 3,275,000, or 38 per cent of them. France was dependent on export markets for the disposal of 50 per cent of her production; Italy nearly 75 per cent; Great Britain 21.5 per cent; Germany 36 per cent; and Canada 28.6 per cent.

In view of the fact that foreign manufacturers are using every effort to retain a trade which means so much to them, tire prices in some export markets have been reduced to levels even below those in the United States. When it is considered that American manufacturers have to meet the low prices of competitors in export markets and in addition have often to pay greater transportation charges and heavier customs duties than competitors in shipping to the best markets, it is surprising that the American exports constituted so large a portion of the world export trade as was the case in 1923.

In estimating the 1923 production capacity consideration was given to the relative activity of the tire industries in the various countries, to the general economic conditions in each country, and to the seasonal nature of the tire trade in Canada. A comparison of the estimated production and the production capacity will show that the French industry is estimated to have produced at 80 per cent of capacity in 1923, British manufacturers at approximately 57 per cent, etc. While it is intended to show the relative activity of the tire industries in the various countries rather than the actual production capacity, it is believed the estimates are conservative, and that the production capacity of foreign tire manufacturers would total at least 12,500,000 tires per year.

Hill Enters Speedway Classic

Bennie Hill, is the third entry to be announced as a competitor in the International 500-mile race to be held at the Indianapolis Motor Speedway May 30. Hill's entry is a Miller Special.

Indoor Airplane Tournament

The first international indoor miniature airplane tournament by telegraph and radiophone is scheduled to be held May 10, 1924, at the Municipal Pier, Chicago, under the direction of Terence Vincent, Executives' Club of Aviation Chairman, 746 Monadnock Block, Chicago, and the organizations associated with him.

The plan is for three citizens of standing in each participating community to observe the flights of the rubber-motored airplanes, officially time the three flights of each contestant, and wire the results of the best five to Mr. Vincent. Entries should be in with the Tournament Director by May 7.

Among the events listed are:

Duration, 50-foot speed race, 1-pound glider, original commercial design tests for *The Daily News* trophy, food carrying designed planes, weight carrying, skeeter plane duration-plus-distance, ¼-oz. planes duration-plus-distance, power models (other than rubber motors), scale models.

Last summer, the winning duration plane stayed in the air 3¼ minutes, and weighed .06 of one ounce.

Long Service With Franklin

Three hundred and forty-two employes, or more than 11 per cent of the entire working force, have been employed at the H. H. Franklin Manufacturing Company, Syracuse, N. Y. (makers of the Franklin car) for ten years or more. Of this number 162, or practically one-half, have been employed fifteen years or more.

icense Fee Collection Halted; Victory for the Illinois Manufacturers' Assn.

NOTHER victory was won by the Illinois Manufacturers' Association over authorities of the City of Chicago when lge Francis Wilson, in the Circuit Court Cook County, on March 24, granted a iporary injunction restraining the City m enforcing that portion of an ordinance uiring sash, door and blind manufacers to pay license fees on the number their employes. The case was that of ner, *et al* vs. the City of Chicago, and s brought by the Illinois Manufacturers' sociation through its General Counsel, lin C. H. Fyffe, who maintained that the dinance was invalid because it was purely d simply a revenue measure.

Under Judge Wilson's decision the folving manufacturers, who are included ecifically in the ordinance, are relieved om payment of these license fees:

Sash, doors and blinds
Paper boxes
Cigar boxes or other wooden boxes
Packing boxes
Planing mills
Factories for wood turning
Portable garages
Moulding
Picture frames
Office supplies, fixtures or furniture.

The Illinois Manufacturers' Association s adopted the policy of protecting instry from the imposition of license fees based on the number of employes and passed for revenue collecting purposes, except in such cases as express powers are granted by the statute, on the broad grounds that the industries already are bearing more than their share of the burden of taxation.

A similar injunction was obtained by the Association several months ago, restraining collection of license fees in the factory and workshop ordinance; the case is now pending in the Supreme Court.

Bills for injunction, filed by the Association against Chicago, are pending against the wearing apparel and manufacturing confectioner ordinances.

J. W. Wiley, Officer of the Vitrolite Co., Is Promoted

J. W. Wiley, who has been Secretary of the Vitrolite Company, Chicago, and Director of Sales and Advertising, has been elected President of the Vitrolite Products Company, New York City, and will be in charge of sales of Vitrolite structural materials in Greater New York and surrounding territory. He has been succeeded in Chicago by Edward W. Smith as Director of Advertising and Sales, and as Secretary and Assistant Treasurer of the Company by W. N. Thurn.

Bill in Congress to Permit National Bank Branches

Representative McFadden of Pennsylvania, has introduced a bill in Congress to amend the National Bank Act to permit national banks to establish branches within city limits in states where state banks are allowed this privilege, and to prohibit the extensions of state-wide branch banking by members of the Federal Reserve System. Other changes proposed will permit national banks to:

Engage in buying and selling of investment bonds;

Loan up to one-half of their time deposits on real estate and lift the limit of one year which now applies to such loans;

Declare stock dividends as a means of increasing their capitalization;

Obtain charters in perpetuity, thus enabling institutions exercising trust powers to administer perpetual trusts;

Engage in a safe deposit business, either by opening safe deposit facilities, or owning stock in a corporation which carries on this service.

In referring to this measure, Henry M. Dawes, Comptroller of the Currency, has urged early action as a matter of utmost importance and benefit to the National Banking System, the Federal Reserve System and to the banks of the country generally, stating:

"If this and other remedial action is not taken by this session of Congress, a crisis will be precipitated which will endanger the National Banks, the Federal Reserve System, and possibly result in a fundamental change in American banking."

BUSINESS AND FINANCE

*"The Field of Investment"—What Are the Sources of Capital Supply? Individual and Business Discussed

II

By C. W. SILLS

Vice-President, Halsey, Stuart and Company, Chicago

WHAT are the sources of capital supply? First, the individual, directly or indirectly, is one of the main sources of capital supply, although fundamentally and ultimately all capital may be said to spring from individual savings.

Let us first consider the individual as a direct source of capital supply. To him millions of credits are sold annually in small average units. Corporations admit him as a partner in their businesses through purchase of shares of stock and as a creditor through ownership of fixed interest-bearing securities. As a result of the war, which necessitated the sale of billions of dollars of securities in this country, and due also to the extensive educational work accomplished by the Liberty Loan campaigns, millions of new capitalists were created. It is a fact that the total number of subscribers to the Fourth Liberty Loan, which was the largest, was 22,777,680 people, or 21.9 per cent of the entire population.

It is estimated that 15,000,000 American investors were thus created by the Liberty Loans who had never before bought bonds, and of this number a vast majority who had never previously had a conception of what a bond really was. Also, the purchase of securities on the installment plan first came into use at this time, creating the savings and investment habit in countless numbers of people. As a result, hundreds of banks installed bond departments and dealers sprang up throughout the country to further develop this vast potential source of capital.

The extent of the wealth of this country and the income which accrues from it to the people, will throw a little more light upon the above statement. The National Bureau of Economic Research estimates, on the basis of figures compiled in 1921, which are the latest I have available, that the total internal wealth of the United States is in the neighborhood of $350,000,000,000, giving to this country not only the greatest amount, but the greatest per capita wealth of any country in the world. The latest figures as to the national income (1919), show that the gross national income is about $66,800,000,000, of which $54,000,000,000 is represented as expense, $11,500,000,000 as savings and the balance as corporate surplus undistributed.

While the national income for the ten years—1909 to 1919—increased 132 per cent in volume, a considerable proportion of it was due to an even greater advance in prices. Nevertheless, on the basis of 1913 prices, the national income over this period shows an annual increase in excess of $1,000,000,000 a year.

More significant, however, has been the increase in individual deposits of national and state savings banks, loans and trust companies and private banks, which increased during the last 30 years from the inconsiderable sum of $4,627,224,000 in 1893 to $40,034,195,000 in 1923 or almost 1,000 per cent.

Second, business concerns. Many corporations, business concerns large and small, have surpluses which are deposited in the banks of the country, or have purchased securities as investment reserves against contingencies of all sorts, during inactive periods or years, or for the temporary investment of their working or fixed capital, pending the resumption or further expansion of their activities.

Illinois' Wealth Jumps 45%

Within ten years the wealth of the State of Illinois has increased 45 per cent—from $15,294,979,000 to $22,232,794,000—according to the preliminary report of the Bureau of the Census, Department of Commerce, while per capita value have increased from $2,627 in 1912 to $3,295 in 1922, an increase of 25.4 per cent. The increases in money values, according to the report, are chiefly due to the rise in prices which has taken place in recent years.

All classes of property increased in value during the period, except livestock, which dropped from $386,701.000 to $319,023,000, or 17.5 per cent. The estimated value of taxed real property and improvements increased from $9,158,336,000 to $11,526,881,000, or 25.9 per cent; exempt real property from $887,983,000 to $1,041,845,000, or 17.3 per cent. Farm implements and machinery from $79,474,000 to $159,557,000 or 100.8 per cent; manufacturing machinery, tools and implements from $451,299,000 to $1,194,793,000, or 164.7 per cent; railroads and equipment from $942,118,000 to $1,221,143,000, or 29.6 per cent. Privately owned transportation and transmission enterprises, other than railroads, from $748,713,000 to $982,060,000, or 31.2 per cent; stocks of goods, vehicles other than motor, furniture, and clothing from $2,640,355,000 to $5,494,828,000, or 108.1 per cent.

No comparison is possible for the value of motor vehicles, which was estimated in 1922 at $292,664,000, because no separate estimate was made in 1912.

Tax-Exempt Securities in U. S.

A statement was recently made by the Treasury Department showing that an aggregate of $12,309,000,000 of tax-exempt securities were outstanding on Jan. 1, 1924. The Treasury figures are based on compilations of the Bureau of the Census, supplemented by the latest information available to the Treasury. The statement showed that the total issued by states, counties, cities, etc., the Federal Government, Federal Land Banks, Intermediate Credit Banks, Joint Stock Land Banks, and the insular possessions of the United States aggregated $14,670,000,000; that the amount held in the U. S. Treasury or in sinking funds and trust funds of states, cities, etc., totaled $2,361,000,000, leaving a net outstanding of $12,309,000,000.

Many Polish Marks

During 1923 the number of Polish marks that could be received for $1 increased from 18,090 at the beginning of the year to 6,460,000 at the end. In other words the dollar could be exchanged for more than 357 times as many marks at the end of the year, says the State Department in a report from Warsaw.

(*Copyright 1924, by the Investment Bankers' Association of America.)

›92,083,000 to Farmers by Farm Loan Board in 1923

t this time, when the agricultural dis- s of the Northwest are in financial its and the Federal Government is mak- provision for extensive financial aid to farmers and banks of that great section country, the assistance given to the ners of the nation during the past year, ɔugh the Federal Land Banks, is of more ı ordinary interest. The annual report he Federal Farm Loan Board, covering 3, has just been given to Congress, and n this report it is shown that last year Government made a total of 60,100 ıs, aggregating $192,083,000 through operations of the twelve land banks in ıtence. Divided into districts the loans e as follows:

ipringfield, Mass., 2,413 and $8,179,- ; Baltimore, 4,401 and $12,046,601; Co- ıbia, S. C., 3,955 and $7,882,224; Louis- e, 6.053 and $19,329,600; New Orleans, 152 and $21,938,000; St. Louis, 3,429 l $9,243,800; St. Paul, 6,511 and $27,- ȝ,500; Omaha, 3,808 and $23,632,300; chita, Kans., 4,794 and $17,045,200; uston, Tex., 8,103 and $22,239,100; rkeley, Cal., 2,150 and $7,750,600; Spo- ıe, Wash., 4,331 and $15,422,550.

During the year the twelve land banks ired Treasury stock to the amount of ,830,495. Treasury stock in the banks Omaha, St. Paul, Houston, and Spo- ne was entirely paid off, and those banks d remaining substantial surpluses, indicating, it was said, that the business had been soundly administered and that the banks now are permanent institutions and assets to the national life.

Midland Bank of London Is Largest in the World

The largest bank in the world is said to be the Midland Bank of London. There has been a neck-and-neck struggle for many years between the "Big Five" of London, but the Midland has shot ahead of its competitors by buying control of the North of Scotland Bank. It has now 2,188 branch banks and total deposits of $2,400,000,000. It has 1,746 banks in England and Wales, 342 in Scotland and 100 in Ulster. It had twenty banks in the Irish Free State, but it sold these last August, as its policy is to have no branches outside of the United Kingdom.

All other English banks have branches abroad, but the Midland has held fast to its old policy of remaining strictly a home-land bank. It has over 900 agents in the Dominions and foreign countries, of which 123 are in the United States.

In 1923 the Midland made its usual net profits of $11,000,000. In the last six years its profits have been $70,000,000 and its dividend has been maintained steadily at 18 per cent. It has the largest reserve fund of any British bank—$50,000,000—and its loans to clients are over $1,000,000,000. The value of its land and buildings is estimated at more than $25,000,000.

Income Tax Receipts Fall $90,000,000—U. S. Bureau

Federal income tax receipts for the first quarter of 1923, ending March 15, will fall some $90,000,000 below the original Treasury estimates, according to a report recently drawn up by the Bureau of Internal Revenue for President Coolidge. Adoption of the installment payment plan by many taxpayers who, heretofore, have paid in full, was responsible for the slump, the report said. Prospects of a 25 per cent reduction in 1923 taxes being provided by Congress led to the change from cash-in-full payments to installment payments, it is said.

Payments in the First Illinois (Chicago) District bear out the statement from Washington. Mrs. Mabel G. Reinecke, Collector, has announced that the receipts in that District between March 1 and 15 amounted to $29,072,456. This is considerably under the collections of last year which aggregated $36,292,619.

New York City, divided into two districts, aggregated over $60,000,000. Manhattan, below 23rd Street—Second District—paid in $40,025,596, while the territory above 23rd Street—Third District—paid in $20,491,928, according to Collector Frank Bowers.

Collections for the current quarter, ending June 15, will exceed the same quarter in 1923 by $12,000,000 it is predicted by the Revenue Bureau.

If Your Business Is More Than Local

At luncheon recently one of the business leaders of America said to *James R. Howard* that the *Howard-Moorhouse Reports* should exert an important *stabilizing influence on prices and business*.

We are glad to believe this is so. Agriculture and industry are intricately interwoven. What the farmer is thinking and doing and in particular the *size and time of his cash income are reflected in the balance sheets of business*.

One of our duties is to gauge, months in advance, agricultural income. *These advance estimates are dependable* for reasons which we shall be glad to tell you. They are being used by some of the leading business organizations in the country. They are *within the reach of the smallest company*. Any business whether selling directly to the farmer or not, *if its transactions are more than purely local*, should find in our reports material worth many times the cost.

Send for the bulletin: "Farm Income in the Dairy States"

Senate Bill Would Abolish U. S. Railroad Labor Board

There is now pending before a sub-committee of the Senate Committee on Interstate Commerce a bill for the drastic readjustment of the present Railroad Labor Act which would be a step backward, if finally enacted into law by Congress. It is known as S. B. 2646, and it provides for abolishing the Railroad Labor Board which, for several years, has been a protection against strikes and has furnished unbiased facts to the public. A circular recently sent out by the Illinois Manufacturers' Association to its members says regarding this measure:

> "It would provide for large and unwieldy Boards of Adjustment to be paid for at public expense. These Boards would supplant existing bodies in the more important branches of service paid for by the railroads and employes.
>
> "The public would have no representation on these proposed Adjustment Boards and its rights would receive small consideration.
>
> "It would force every railroad employe to belong to a union as surely as the check off system in the mining industry. Unless they belong to a union, employes would be given no hearings on wages, grievances or working conditions.
>
> "Such a bill would give the unions the power to refuse to deliver goods to a concern which had a strike on its hands.
>
> "It is a shrewd movement on the part of the railroad Brotherhoods to get the railroads back on a closed shop basis and revive union membership which has dropped below 50 per cent.
>
> "If you are against this measure, wire or write to Senator Medill McCormick and Senator William B. McKinley to oppose it in public interest. Also ask your representatives in the House to use their influence in opposition to a similar measure in that body."

James McNally, of Rand-McNally, Dies In Pasadena

James McNally, Vice-President of the Rand-McNally Company, Chicago, died a few days ago in Pasadena, Cal. He was 76 years old, having been born in Armagh, Ireland, Oct. 5, 1847. He was educated at the Royal School of Armagh and the Royal College of Surgeons in Dublin. He came to Chicago in 1869 and with his brother, the late Andrew McNally, entered the publishing firm of Rand-McNally. Mr. McNally is survived by two sons, Raymond Andrew McNally of Los Angeles and James H. McNally of Chicago, and one daughter, Mrs. Nina Lydia Bingham of Pasadena, whom he was visiting at the time of his death.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

ſREET congestion is the great problem facing the electric railway industry of United States today, according to Brit- I. Budd, President of the Chicago North ›re & Milwaukee Railway and President the American Electric Railway Associa- ı. The statement was made at the recent l-year conference of the Association.

'his situation, Mr. Budd predicted, will ome increasingly difficult because elec- : railway traffic is increasing at the rate 500,000,000 passengers a year. The .r 1923 was the biggest year the electric lways ever had, for they then carried 000,000,000 passengers.

ſo take care of the growth of business electric railway industry will require litional capital amounting to $175,000,-) a year.

ſhe industry need have no fear of com- :ition from automobiles, the speaker de- .red. The electric railway has proved elf to be the cheapest and most efficient ·ans of carrying the masses in the cities, d will continue to render that service.

"For a number of years everything that ı on rubber tires was regarded as a bug- ar by the electric railways," said Mr. .dd. "Experience has demonstrated that r mass transportation the gasoline-driven hicle cannot supplant the electric car. e have very properly accepted the motor- s as one of the necessary adjuncts of our ınsportation business. We are rapidly coming acquainted with its uses as one of e tools of urban and interurban trans- ›rtation, and are co-ordinating it with our ectrically propelled cars."

Billions for Labor-Saving Devices

More than two billion dollars were spent the people of the United States during)23 for electrical labor saving devices ıd the cost of their installation, according an industrial survey just completed. his total investment, for which the exact gure is $2.003,745,000. exceeds by more ıan half a million dollars the gross rev- ıue of the electrical central stations of ıe country for their record output of cur- ·nt last year.

Superpower Group Formed

Eleven electric power manufacturing ompanies, representing $315,000,000 of ıvested capital and serving five East Cen- ·al states, have linked themselves in a co- perative distributing system to be known s the Coal Field Super-Power group. ›oncerns which, according to the Ameri- an Water Works and Electric Company, ave joined the co-operative system are:)uquesne Light Company, Penn Public ervice Corporation, Potomac Edison Com- any, American Gas and Electric Com- any, Cleveland Electric Illuminating Com- any, Ohio Public Service Company, Penn-Ohio Electric Company, Northern Ohio Traction and Light Company, Penn Central Light and Power Company, Keystone Power Corporation and West Penn Power Company.

The completion of plans for this group is in compliance with the scheme of Herbert Hoover for the mobilization of industry in the United States as a measure of national defense. The new corporation will operate forty stations delivering more than 2,000,000 horse power.

Growth of Chicago's Telephones

In 1877 Chicago had four—just four—telephones, an average of one to each 125,000 of the city's then population. They were installed as experiments under supervision of B. E. Sunny, now Chairman of the Board of the Illinois Bell Telephone Company.

Today that total of four has passed the 700,000 mark—or one telephone for each four persons in the city.

Statistics covering the growth of the company, in steps of 100,000 each, as given out by President W. R. Abbott, are:

October, 1905	100,000 telephones
October, 1909	200,000 telephones
November, 1912	300,000 telephones
September, 1915	400,000 telephones
July, 1918	500,000 telephones
November, 1921	600,000 telephones
February, 1924	700,000 telephones

Repair Shops for G. E. Company

A recent review of the supply and repair parts required in connection with the great variety of apparatus manufactured by the General Electric Company has led to the establishment of a wider and more adequate group of service and repair shops in the United States. In addition to the service and repair shops maintained at all General Electric factories, thoroughly equipped shops have been installed and are now in operation at the following points: Atlanta, Chicago, Los Angeles, New York, Kansas City, Minneapolis, Oakland, Philadelphia, St. Louis and Seattle.

How to Use the Telephone

The most important thing to remember in using the telephone is to talk straight into the instrument with the lips not more than an inch away. Every added inch of distance is said to be equivalent to lengthening the line of communication 120 miles in long distance service. Loud speaking does not count so much as the right position—the person who speaks slowly and distinctly is heard better than the person who shouts. Telephone experts say that straight talking into the receiver will add 25 per cent to the value of service.

QUALITY, PREPARATION
AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

HARRISBURG COAL

Burns to a White Ash — Is Hand Picked
Has a High B. T. U. — Is a Thick Vein Coal
Is Shaker Screened

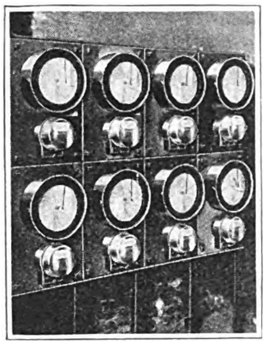
Gathering Cost-Analysis Data

As a guide to the determination and regulation of production costs, your next purchase of steam-consuming machinery should be influenced in large part by accurate data on the amount of steam used by that type of equipment.

And the facts and figures on steam consumption by department and by each process, must also be known, if a cost-finding system is to operate satisfactorily.

These figures are recorded in graphic, permanent form by the Republic Flow Meter. One of these meters on each boiler shows the amount of steam produced per pound of coal consumed—prevents overloading one boiler while another lags. Do you want more information on this system? Then ask for the free bulletin "Power Plant Cost Accounting."



Also makers of CO₂ Recorders, Model S. F. C., and Draft Recorders and Indicators

On Their Anniversary

IT was their thirty-fifth wedding anniversary, and all of the children except John had come home.

That vacant chair had threatened to spoil the day, but—

Long Distance telephone service brought joy to the little home. John, sitting at his desk in the great city, chatted gaily with his parents and sisters. The sound of his voice made his presence real. The telephone had saved the day.

SAVE TIME—SAVE MONEY

Merchandise Despatch Shipments via the North Shore Line are promptly handled. Our stations are conveniently located, and are free from congestion. Consignments reaching us before 6:00 p. m. are ready at destination for the consignee the next morning. This is time saving.

Time consumed while goods are in transit means invested capital that is inactive. Reduce the time that your capital is tied up, and let it work for you. This is money saving.

NORMAN M. FRENCH, *Sales Manager*

Congressional Courage

THE timorous attitude of many of the leaders of both houses of Congress during the last few weeks has furnished the most amazing example of panic in legislative circles that has, in all probability, occurred since the world began. The nearest example is found when the rough, skin-clad Goths descended on Rome and yanked by their whiskers the Roman Senators as they sat paralyzed with fear.

We are glad to acknowledge that there are some men of courage in both houses, and we are also glad to acknowledge that we believe there are some men in both houses who have not been bootlegging and doing things which would make it unpleasant for them to appear on the witness-stand. It is encouraging to note, however, that after having been booted around the Capital for a couple of weeks, the fighting spirit is returning to some of the leaders.

Those leaders who complacently think that the sun rises and sets in Mr. Coolidge may misjudge the temper of the people. We believe that Mr. Coolidge has the confidence of the rank and file, but we do not believe that his popularity and strength are so great that they will carry with him several Senators who have spent most of their time during the last few weeks under the table.

The Federal Trade Commission

THE Supreme Court in a recent decision has limited the powers of the Federal Trade Commission in its unjustifiable attacks on business. In late years this body has interpreted its powers and purpose in the nature of badgering and baiting business, rather than making an honest rational effort to prevent illegal practices. In 1923 it brought complaints against 2,384 defendants, a great many of which were dismissed by the courts as being unjustifiable. A governmental body whose decisions and practices are condemned so often by the courts can be of little use or have much influence.

There is a vacancy on the Commission and it is hoped that President Coolidge, in filling it, will be unusually careful in making the selection. It is a bad thing to get a man in public office who has an axe to grind.

Buying Combinations

IT has been suggested that the Webb-Pomerene Law be amended so as to permit combinations in the purchase of raw materials produced outside of the United States. The statute now authorizes combinations for the purpose of selling goods to foreigners, and an Administration official has suggested the propriety of combining to soak the foreigners in making purchases. MANUFACTURERS NEWS doubts the wisdom of this suggestion. The Webb-Pomerene Law, as we understand, has not proven very helpful. The old method of cultivating friendly relations is better than artificial combinations.

Cheer Up! Spring Has Come!

DESPITE the gloomy outlook occasioned by a multiplicity of investigations in Congress, reports on industrial situations are encouraging. The United States Department of Labor states that in February, based on reports from 8,222 establishments in fifty-two industries, there was an increase of 6.7 per cent in payroll totals, an increase of 5.4 per cent in per capita earnings and an increase of 1.2 per cent in the number of persons employed.

The sun also rises every morning and there is no immediate prospect of the world coming to an end. It takes more than one swallow to make a Summer and it takes more than one investigation to disturb the industrial equilibrium of our country.

"What a Funny Thing a Whale Are"

Simple Simon Went a Fishing for to Catch a Whale; Startling Tales Inspired by Approach of New Season

A BOUT this time of the year when the birds come up from the South and Spring shows in the offing, outdoorsmen begin to suffer from Spring Fe- as well as that deadly fishing fever yn as "Angloitis." And Gosh! how boys who love the feel of a bass or on a line do suffer! The fever shows through various symptoms. One of produces a veritable mania for buy- all the fishing tackle a man can cart

SO BOSSIE! SO!
THAT DARN' CRITTER SEEMS A BIT NERVOUS!

Whale's Milk

ie. Another inspires a startling series ishing stories, and excited anglers orate wave their arms about the big ones got away last season, but which are ig to suffer during the open season of 4. Some of these yarns are almost as l as that story of the whale farm in ska which got the residents of the Ter- ry all "het up" a few years ago.

seems that not until recently have ple realized the nourishing qualities of le's milk. It's remarkable how much ngth and vigor is induced by a slight ught of this rare liquid. To get it, so story goes, Alaskans have started their whale farm. Trained porpoises are to sea to round up the cows that aze" on open ocean and bring them to big stalls for the milking operation.

ompressed air milking machines solved question of how to draw off 10,000 gal- s of milk from each cow, although for ong time it was mighty dangerous to nipulate this labor saving device. A whale, when anchored in its big stall the shore of the island, is extremely less. She flips her tail incessantly, and en a 20-foot tail is flipped you can im- ne what happens. As a result the milk- fussing around with that air-driven king apparatus would often be knocked a goal by one flop of the cow's tail.

or many months the Alaskans struggled that problem, but finally a solution found. Two large wooden ships were purchased from the Shipping Board. In these huge magnets were installed. When a cow whale is in the stall one of these ships with a magnet is run alongside of her, the electricity is turned on and presto! —the whale's tail is held rigid until the delicate stunt of adjusting the milking machinery is completed. This simple little contrivance has saved many lives on the whale farm this past year, as you can readily imagine.

By BOB BECKER

Written for Manufacturers News

There are, of course, great possibilities in this whale farm. Aside from the market value of the milk and its use at the soda fountain for making "malted whale's milk," the cream will be worth its weight in gold during the Summer. On the mainland, near the whale farm, strawberries can be grown easily. They attain a great size. In fact, they tell us that three of these Alaskan berries make a quart. With such wonderful berries available and cream from the whale's milk procurable, one can imagine how the tourists will throng that Alaskan Coast ready to pay any amount for their strawberries and cream! It's a dish that is guaranteed to aggravate the brain and strengthen the muscles.

The Pre-Season Barrage

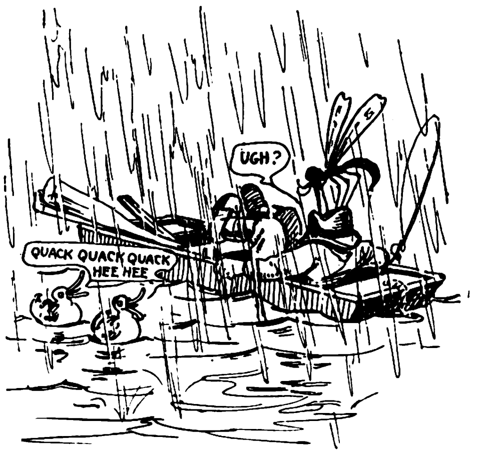
As we have remarked before, the yarns that some of these fishermen are telling now, during the annual pre-season barrage of fishing stories, are almost as wild as this whale milk narrative. We were talking just the other day with one of these angling nuts who was telling us his experiences while on trip into the wilds of New Brunswick. It seems he struck a miserable stretch of bad weather, as it rained hard and incessantly. Moreover, being in the woods early in the Summer, the mosquitoes were so numerous and big that they were dangerous! But it was the rain that broke this fisherman's heart. He told us that he finally had to quit fishing up there as one day, when on a small lake, a storm came up and caught him on the water in his canoe. It fairly poured. The rain came down in sheets, blotting out all signs of land, but he kept at his paddling. After several minutes of alternately paddling and bailing out the canoe, he looked up to see some ducks which his canoe had disturbed. They started to fly, but it was raining so hard that they just folded their wings and paddled in mid-air! Our fisherman friend decided that it was no place for him—not when the weatherman could sprinkle the scenery in such a torrential fashion.

However, we imagine from this fisherman's description that the mosquitoes must have been very annoying. He told us about one day he spent on a trout stream, where the insects were extremely large and numerous. How big they were he didn't realize until once, while pausing to cast, he felt his soft felt fishing hat cave-in as if a clump of mud or a stone had struck it. Then came a sharp pain. Taking off his hat he saw that a healthy-looking mosquito had landed on his hat and it was so large that it just smashed that hat as if it were made of paper.

What Chance Has Ordinary Liar?

Now, what chance has the "first liar" when he comes to match his wits against these fisherman who return from the wilds with such yarns as these? And it's a regular habit with 'em right now, as the great tribe of fishing fans are suffering from their annual shot of Spring Fever, which brings out these quaint little yarns. There are something like 15,000,000 fishermen in the United States. You can figure at least one blood-curdling, stimulating story from each. That gives you some idea of all the remarkable fiction that remains to be written in this country today.

It won't be long before the army of anglers will descend on scores of lakes and streams in the North. The bass and "muskies" are already whetting their teeth on the rocks so as to be prepared to put up a lively scrap. The guides will soon be scouting the waters for signs of "Old Abe" or "Big Ben" or some similarly named, whopping big fish, which has successfully resisted all efforts to capture him. The resort owners and garage men are already busy oiling up their cash registers so that these machines will not jam when the stream of cash from tourists begins to roll in. Last, but not least, the fishing fans are hecticly scanning railroad folders, clean-



UGH?
QUACK QUACK QUACK HEE HEE

A Jersey Mosquito

ing up the old collapsible gasoline cook stove and stowing away the dollars in a sock, in happy anticipation of many delightful days up where the fish and mosquitoes bite with great gusto during the Summer months.

When you figure that Wisconsin resort owners, garage men, hotel keepers and other purveyors to the public and their whims collect something more than $10,000,000 from fishermen and tourists each year, you can see there is quite an army of these restless spirits waiting for the days when flowers will bloom, the birds sing and the fish bite.

This Is the Life!

But it's the life—this luring of the big fish and sleeping under the pine trees in the good old Summer time. Even the ladies have taken to it like ducks to water, and on some days are able to show up the husbands in wielding a rod and line. Some haven't quite approached the stage where they can put a wriggling worm on a hook, but if high boots, bloomers, middy blouses and gloves (to keep their hands from getting sunburned) are any criterion, the ladies sure are the berries in the outdoor fishing game.

But you can't blame 'em. If, for no other reason than self-defense, they have to go out and acquire a few fishing lies so as to keep pace with some of the whoppers they have been listening to these many years.

Profit-Makers Use it

A MAN is known by the company he keeps, a gasoline by the people who use it. A roster of the business concerns who use Red Crown Gasoline in their trucks and automobiles would look like a list from Dun or Bradstreet's of those companies with the highest credit ratings.

The men who manage these companies insist that Red Crown be used in their machines because they have found it is the most economical fuel they can use. Their records of operating costs furnish an accurate guide for the purchase of supplies and equipment. The verdict which these records return, in the case of gasoline, makes it mandatory upon them to use Red Crown. These cost records prove conclusively that

RED CROWN
GASOLINE

not only gives more miles per gallon, but also reduces repair costs. Because it is carefully refined for the one purpose of producing power in the modern internal combustion engine, it leaves a minimum deposit of carbon to collect on valve and piston heads. It burns with a quick, steady explosion which puts power behind the piston for the full length of the stroke and saves wear and tear on crank shaft and wrist-pin bearings.

If you have not tried Red Crown in your own machine or in those you maintain for your business, do so at once. Take the word of the friends of Red Crown, that it is the most satisfactory gasoline, both from a performance and cost basis, that they have ever used.

Just as soon as you have given Red Crown a trial, preferably in competition with other gasolines, you, too, will be a friend of Red Crown.

A Booklet Worth Reading—

The lack of only one of the "Six essentials of Good Gasoline" may increase your hauling costs materially. Therefore, it will pay you to take the few minutes which are necessary to read this booklet "What Is Good Gasoline?" It explains these "six essentials" from A to Z. A post card will bring it—free.

Section 28 of Marine Act Threatens Export Trad

At a recent meeting of the Foreign Tr Committee of the Illinois Manufactur Association, opposition was expressed the enforcement of Section 28 of the M chant Marine Act, 1920, for the following reasons:

> It would add to the cost and difficulti of American manufacturers, farmers, p ducers and merchants engaged in fore commerce;
>
> Refrigerator space on American flag v sels is not available to accommodate all pe ishable freight shipped by American e porters;
>
> It would penalize American exporters wh owing to the lack of American flag vessel would be compelled to use foreign ships t certain ports;
>
> It would probably divert to Canadian por a large percentage of American shipments.

Section 28 provides that when the Unite States Shipping Board shall certify to th Interstate Commerce Commission that there are adequate facilities for carrying American exports on American flag ships, th Commission shall issue an order denyin to shipments carried in foreign flag shi the reduced export inland rates and privileges of free time, etc., commonly accorde to export shipments. The Shipping Boar having certified to the Interstate Commerc Commission that such facilities are no adequate, the Commission has issued a order naming May 20, 1924, as the dat when Section 28 is to become effective.

Illinois millers, meat packers and many other exporters, deny that there are sufficient American flag ships to carry all their exports to every port. They would, therefore, be compelled to ship in foreign vessels and would lose the advantage of inland export rates which, on many commodities, are lower than domestic rates.

Representative Newton has introduced H. R. 8091, an amendment to Section 28. This is an emergency measure and would give the Commission power to suspend still further or modify Section 28. Hearings on the Newton Bill were held by the House Committee on Merchant Marine and Fisheries on Thursday, April 3.

Kentucky Legislature Ends

The legislative session in Kentucky has just closed. A total of 1,081 bills were introduced, a number greatly in excess of an recent session. It was expected the ne result in "new law" would greatly exceed that of any session in a decade, accordin to the Associated Industries of Kentucky

Traffic Club's New Officers

George A. Blair, Traffic Manager for Wilson & Co., packers, has been elected President of the Traffic Club of Chicago. Other officers elected were:

Vice-Presidents—Fred A. Butterworth, W. H. DeWitt, Jr., E. S. Buckmaster.

Secretary—H. E. MacNiven.

Treasurer—R. J. Wallace.

Directors—E. K. Fleming, George E. White, W. L. Taylor, George B. Hild and M. H. Kennelly.

Vhat Lies Ahead of Us In Business*

Rewards for the Man Who Hustles Rather Than the Speculator, Forecast of Conditions to Close of 1924

the preceding article Mr. Vance has eached the conclusion that all indica- point to a sufficiently healthy condi- for business to go on for another six ight months; that it will score a con- able improvement this Spring, and no long continued decline will start re the Fall of 1924.—Editor's Note.

II

IT now becomes necessary to ask, are there special considerations in the present situation which might negative such a conclusion? Of course, y business has some peculiarities, but ems to me there are a few which must icked out of the present situation al- t by common consent.

ertainly, one of these is the relatively r position of the farming population. in the United States, have become ac- omed to talk of our farmers as the kbone of our national prosperity and our national sanity in political action. for the past three years we have spent h time hearing of their poverty and of ical farmer politics. Because of this y say we must have a great recession in iness.

am not unsympathetic with the farm- Neither am I unaware of his trouble. as a real dirt farmer long before I was economist, and some of my intimate nds are real dirt farmers still. I be- e I know the situation better than most the farm agitators know it and, with t knowledge and with the sympathy ich goes with personal friendship and n with blood relationship (for two of brothers are active farmers and cattle ders out in Iowa today) I tell you the mers of the United States and Canada their darkest days in 1921, and except- possibly those dependent upon wheat ne, their condition today is far better n it was in 1922 or early 1923.

I admit that farm conditions are not in mselves good, and if our present busi- s situation had been built upon good ricultural conditions, I should fear for continuation. But it has not been built on such conditions. Every step in ad- ce since the Fall of 1921 has had to tend with low purchasing power on the m. If such a condition meant a cer- nty of further decline, then we should ll be in the very midst of our worst de- ssion. The logic of events seems to ve dictated the answer beyond any pos- ility of theoretical reasoning, and that swer is that the agricultural conditions

By RAY VANCE

President, Brookmire Economic Service, Incorporated

do not make liquidation from the present condition a necessity.

Of Europe I need only to say that it is a neutral factor in the immediate outlook. Later I shall have more to say of it, but for the immediate future I neither hope much nor fear much from changes in Europe.

As a conclusion let me say that I see no reason to fear an immediate decline of business, but I rather see great reason to believe that better activity and possibly even higher prices are yet to be seen this Spring.

Closing Months of 1924

Since Jan. 1 a great change has become apparent in the symptoms whose position prior to that time indicated business expansion for the Spring and Summer of 1924. Speculative activity has become abnormally high, physical volume of domestic production has made one of the greatest increases for any like period of time during the past twenty years, imports have continued to run high, bank deposits have begun to turn over with abnormal rapidity. The British money rates have become higher than the average for this time of the year. In fact, only easy money in the United States remains as a favorable symptom for a continuation of business expansion into the Fall of 1924.

Barring, then, an important change in some of these fundamentals, we must expect the present business expansion to come to a close around September and to be succeeded by a period of decline. When I say "barring an important change in some of the fundamentals," I do so because not every unfavorable change is the forerunner of a depression in business. Four times in the past twenty years the symptoms have been bad, the stock market has declined, and apparently the stage has been set for a business reaction, but after two or three months the trouble has been cured by a speculative reaction alone, so that business has gone on with no important interruption. Such may easily be the case this year.

At the very worst, no very serious depression has ever come at a time when money was as easy in the home market. Let us, therefore, build up our forecast for the year 1924, as follows:

1—The immediate future carries a strong promise of further expanding business.

2—The closing months of the year will probably see the beginning of a relatively mild reaction. Such a reaction may be entirely averted by developments yet to come this Spring, but its probability is great enough to warrant present caution in plans for the end of the year.

As soon as I mention the probability that we shall enter another major period of declining business before this year closes, I open up the whole question of your future business life and of mine. It is a question, which I believe to be deeper and more important than any question, as to the time when the next recession of business activity will occur.

Are business concerns already crippled by the great stagnation of 1921, to go through that experience again, after only the mild recovery of the past two years? Or, worse than that, is the whole economic and social fabric of Western civilization so disrupted that we must go through a decade of adversity before really profitable business activity can be expected again? Or, worst of all, have we come to a debacle of our Western civilization, to a time when Europe is to pass into the limbo of backward nations, and a time when we here in America must build up a new world civilization to pass over to the yellow races? Have the political and racial hatreds of Europe brought the world of the white men to a period where our souls shall be tried as never the souls of men were tried before?

We have lived a lot of our adult lives amid sudden movements. When we think of peace we think of it as an unstable thing. We think of war as something likely to come over-night. When we talk of prosperity we mean a wild rush that covers all mistakes of management in a deluge of unavoidable profit. When we talk of depression we mean a period of almost hopeless stagnation like 1921. We have, so to speak, lived our business lives either on mountain peaks or in deep canyons.

Mountain peaks and grand canyons are all right for vacation scenery, or even for the feats of a few engineers with their mining or construction crews, but most of the life of the human race is lived in the broad valleys and on the still broader plains broken by only moderate undulations. There is where its cities are built, its food is raised, its material civilization is developed. And the time has come to us when we must forget some of our mountain climbing, as well as of the trembling on brinks of awful precipices, and get back to a more sane, even if less exciting, life.

No business generation of the past ever had two great inflations, and none ever had two 1921's. Variations in business volumes, rising prices and falling prices we shall have as long as human nature exists. I, certainly, should hate to see men stop studying the cause of those rises and declines. But I am weary of seeing business palsied with fear every time that

This is the concluding installment of an ress delivered before a recent meeting of Illinois Manufacturers' Costs Association).

ttack on Coolidge Cabinet Abates

Onslaught Ready for Mellon, Wallace, Hoover, Halted; Immigration Bill Before House—Restriction Favored

Washington, D. C., Apr. 2.—Weeks of turmoil and contention over the continued presence of Harry M. Daugherty, of Ohio, as head of the Department of Justice, came to a climax last Friday, ıen President Coolidge asked for, and ceived, the immediate resignation of his torney-General. With his departure, foes the administration in Congress marked another tally in their campaign against dividual members of the Coolidge Cabi t, and prepared to transfer their attacks other department heads.

DAUGHERTY FIGHT BITER—The resignation of Mr. augherty brought to a conusion one of the bitterest ntroversies in the annals of ongress. With his original pointment by President arding regarded as inexpeent in many quarters, the lations of the former Atrney-General with Albert B. ll, of Teapot Dome oil ase fame, were early seized oon by Senate investigating mmittees as a lever with hich to pry the Ohioan out the Coolidge Cabinet. Subquently, an investigation by Senate committee into the ministration of the Department of Justice itself was ituted, during the course of hich testimony concerning e private affairs of Mr. augherty piled up such a ass of allegations, charges nd innuendoes as to lead to a ave of public resentment over is retention as head of the Judicial Department of the Government. Some weeks ago, epublican leaders in the Senate sought to onvince President Coolidge of the advisaility of Mr. Daugherty's removal, but it as not until the Attorney-General refused turn over the files of his department to he Senate Investigating Committee that the ie was cast, and his resignation called for.

PRESIDENT COOLIDGE'S POSITION—In asking how he could consistently reuse the request of the Congressional Comittee for departmental information "on he ground that you, as Attorney-General, dvise against it, when you as the indiidual against whom the inquiry is directed necessarily have a personal interest n it," President Coolidge outlined in a entence the issue upon which the resignaion of his Attorney-General was based.

By JOHN M. TOWNSEND

Washington Correspondent, Manufacturers News

Disclaiming any intention of prejudging the controversy waging in Congress, the President, nevertheless, pointed out that difficulties were certain to recur with increasing embarrassment, which would result in the inability of Mr. Daugherty to satisfactorily perform the duties of Attorney-General.

DAUGHERTY'S REPLY — Fighting to the last, Mr. Daugherty supplemented his formal letter of resignation with a communication, written "as a private citizen," in which he declared the President's position to be untenable, denied the assertion that the efficiency of the Department had been impaired through the Congressional activities, and roundly scored the campaign which had been leveled against him. Vigorously attacking the Senate Committee with the declaration that "in such a tribunal, by such methods, and out of the mouths of such witnesses, an honest man could be convicted of any crime," Mr. Daugherty declared the attacks were instigated by his personal enemies. President Coolidge allowed this epistle to go without reply, and, after delivering his broadside, Harry M. Daugherty, of Ohio, joined Edwin Denby, of Michigan, in returning to private life after a tempestuous career as member of the Coolidge Cabinet.

TALK OF SUCCESSOR—In picking a successor for Mr. Daugherty, President Coolidge is engaged in seeking an Attorney-General who can combine with an adequate legal knowledge a high degree of administrative ability. The President regards the Department of Justice as an important cog in the Government machinery in which business efficiency is as necessary as legal profundity, and where orderly administration of its routine affairs is as vital to the welfare of the country as the soundness of legal precepts. Speculation as to the identity of the new department head is expected to be set at rest by an official announcement during the week, but in the meantime, the names of Chief Justice Rugg of the Massachusetts Supreme Court, Dean Roscoe Pound of the Harvard Law School, Dean Harlan F. Stone of Columbia University and Federal Judge William S. Kenyon, former Senator from Iowa, are being made the subject of comment in Washington at the present time. There appears to be little likelihood that Secretary of State Hughes, formerly an Associate Justice of the United States Supreme Court, will be transferred to the Justice position. While Washington is practically a unit in recognizing Secretary Hughes' legal ability, he is regarded as too valuable in his present portfolio to warrant a change which would result in as much difficulty in picking his successor as there might be in finding a new Attorney-General.

CONGRESS FOES' PROGRAM—Removal of Mr. Daugherty from office, hailed as a victory by opponents of the Administration in Congress, is not expected to stay the onslaught against the President's official family. While the Daugherty controversy itself may eventually drift into oblivion by reason of the disappearance of its chief character, the Congressional head-hunters are outspoken in their intention that the resignation of Mr. Daugherty, and the earlier departure of Edwin Denby from the post of Secretary of the Navy, shall be followed by a trip of other members of the Coolidge Cabinet back to the limbo of private life. Secretary of the Treasury Andrew W. Mellon has long been marked for slaughter by the Administration's foes, and was expected to be their next immediate target, and the administration of Secretary Hoover in the Department of Commerce, as well as that of Henry C. Wallace in the Department of Agri-

culture, were expected to be the targets of heavy Congressional bombardment before the national election put an end to the present era of political blasting. The Congressional investigating committees were expected to add to the accumulation of charges, allegations and innuendoes, upon which their colleagues can be depended to base their activities, but the Republicans have, apparently, rallied and by vigorous, clean-hitting defense, have halted the turmoil.

IMMIGRATION QUESTION UP—The policy of the United States with respect to the admission of foreigners to its shores. is expected to be started on its first step toward Congressional determination this week, when the House of Representatives will consider the Alien Restriction Bill endorsed by a large majority of its Immigration Committee members. Providing a policy of admission of immigrants based on a quota of 2 per cent of the number of persons of like nationality resident in the country at the time of the census of 1890. the measure is hailed as the only method of protecting the nation from the largest migration of peoples in world history, which is anticipated with the expiration of present laws on June 30. House Republicans are preparing to make a determined stand for this restrictive legislation, but, opposed to them, Representatives Sabath of Chicago and Dickstein of New York, are expected to seek amendment of the measure so as to permit a much greater influx of immigrants from Southern and Eastern European countries. Based on the sole question of "let 'em in, or keep 'em out," the Congressional fight is expected to be a lively one, with the preponderance of sentiment apparently on the side of the "keep 'em outs."

LaFOLLETTE ILLNESS WORRIES—The political effect of an attack of pneumonia upon Senator Robert M. LaFollette, of Wisconsin, is causing some concern among his adherents who, confident that their leader will be physically able to overcome the mild case of the disease, are nevertheless anxious as to the part his illness will play in the formulation of his future plans. Hailed in many quarters as the probable standard bearer of a third party for the presidential nomination this Summer, the question of Senator LaFollette's ability to stand the physical strain of such a vigorous campaign as the coming battle promises to be, has arisen anew. Conversely, members of the two dominant political parties cannot help but take some comfort from the prospect that "Fighting Bob" may be unwilling to tax his strength with another campaign this year.

Kerosene Production in 1923

Kerosene production in 1923 was 2,348,934,712 gallons, an increase of 1.85 per cent over 1922 output. Imports during the year were 301,483 gallons, which added to production, shows a total new supply of 2.349,236,195 gallons. The indicated domestic demand for kerosene during the year was 1,492,535,909 gallons.

U. S. Has 122,519 Lawyers; Increase of 6.8% in Decade

In his annual report as President of th Carnegie Foundation for the Advanceme of Teaching, Dr. Henry S. Pritchett give some interesting comparative professional statistics showing that in the past decad the number of physicians, lawyers, and clergymen in proportion to the populatio of the United States has diminished, whil the number of dentists, trained nurses, welfare workers, "healers," and engineers ha increased.

Figures for 1920 show 122,519 lawyers in the country, including judges and justices; 150,007 physicians and surgeons. including osteopaths; 127,270 clergymen, and 64,660 civil engineers and surveyors. In the decade ending in 1920 there was an actual increase in the number of lawyers of 7,815 or 6.8 per cent; a decrease in physicians and surgeons of 1,125 or 7 per cent: an increase of civil engineers and surveyors of 12.627 or 24.3 per cent; electrical engineers, 11.799 or 77.2 per cent; mechanical engineers, 23.175 or 159.7 per cent: and a decrease of 235 or 3.4 per cent for mining engineers.

The following figures give the number of members of these professions to each 100,000 of population in 1920: physicians and surgeons, 142; clergymen, 120; lawyers, 116; civil engineers and surveyors. 61; mechanical engineers, 36; electrical engineers. 26; mining engineers, 6.

Your Time Is Money

Your freight shipments have often been delayed more between your doors and the freight stations than on the railroad.

Quick and careful freight house trucking is our specialty.

Perhaps the operation of your own trucks runs your trucking costs too high.

We can do your trucking cheaper and quicker than you can — that is our business.

Perhaps your trucking demands come only at certain intervals.

Tell us your requirements and let us submit our estimate for your trucking.

Perhaps your neighborhood can support a regular trucking service.

Let us study your needs and submit a schedule to care for your neighborhood trucking.

Perhaps you require fast and safe suburban and interurban service.

Our despatcher can give you a schedule as exact as a railroad time card.

We have 75 trucks from 1 to 7 tons capacity in perfect running order day and night.

Let us help you save your money.

Minority of Minority Rules in U. S.

Election Figures Show Average Voter's Indifference; Business Men Should Take Active Interest in Ballot

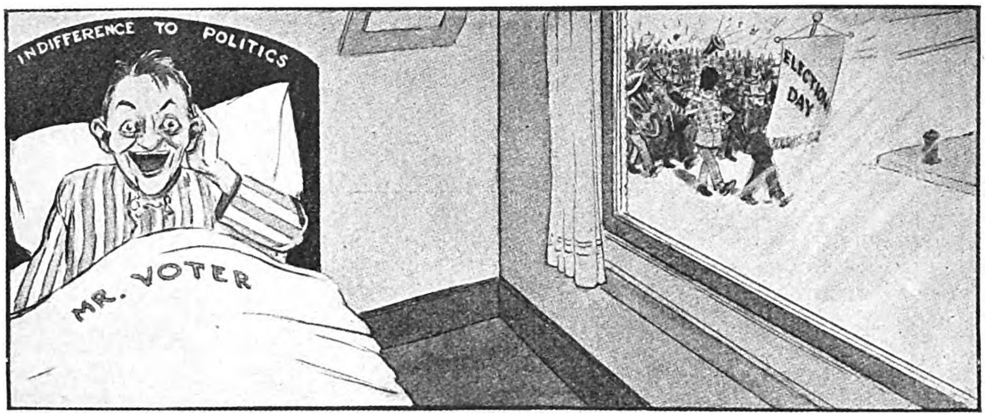
By **WILLIAM H. BARR**

President, National Founders Association

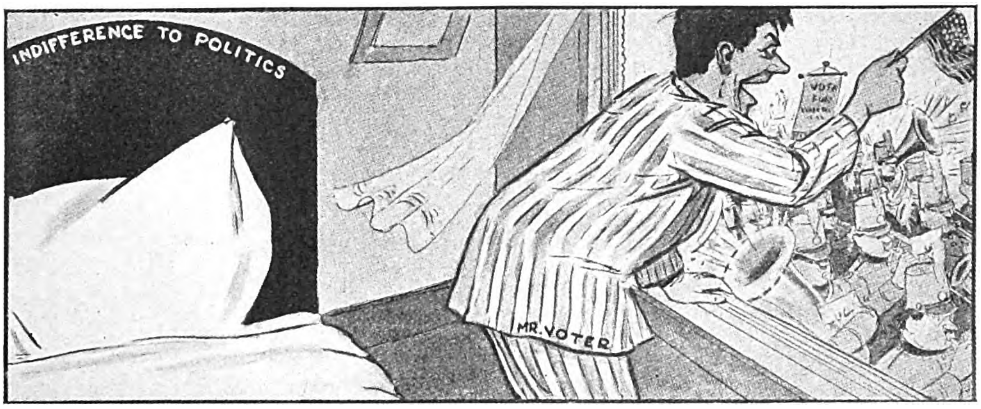
FROM time to time we have expressed the opinion that one of the most important duties of every citizen interested directly or indirectly in business to vote at the primaries for the selection candidates, and at the elections where ndidates are elected to office. This nation lay is a government by a small minority cause there are w men in public e who represent, the actual vote which they were ected, more than a inority of a minor- r. Less than one- lf of our voters rn out in Presidenl elections, where- , according to fig- es from respon- ble sources at the st election in Eng- nd, more than 80 r cent of the pos- ble votes were cast d in the most re- nt German elec- ns more than 89 r cent were cast.

The census of 20 reveals the fact at in the United ates there are 54,- 8,895 citizens, ale and female er 21 years of age. hese figures repre- nt the voting pop- ation. In 1920, e last Presidential ection, only 26,- 7,574 persons ted, while the to- l of all the votes st for Senators d Representatives Congress in the ection of Novem- er, 1922, was only 0,579,191, or less an two out of very five possible oters.

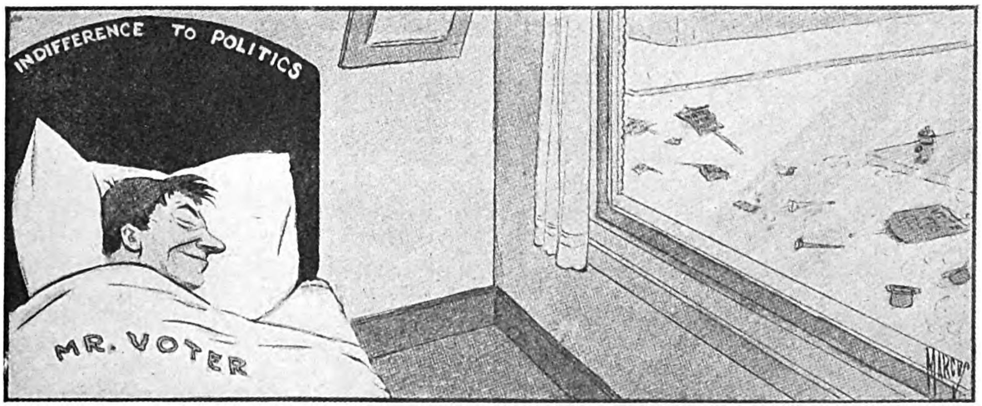
These figures jus- fy everything that as been said, con- rning the negli- nce of our citi- ns. We are governed by a minority, t that is not the significant part of it. the 1922 election, thirty-four Senators ere elected and contrasting their votes ith the total voting population of the tate from which they were elected, we find that they represent in the Senate today only 24 per cent of their constituents. Surely, this is not representative government in the sense in which it is understood. The remaining 76 per cent of the people either voted against these Senators or failed to vote at all. Under such circumstances there are very few who can cast the stone of possible criticism against any of these Senators. It is true, of course, that these men who were elected do typify and represent the people and with one or two exceptions are thorough-going Americans, but they represent in their official position today the absolute indifference of the people to their civic duty. It is true, therefore, that those who are charged with government very often represent only a minority of a minority of our people.



No, sir! You can't keep him in bed when he hears the band coming down the street.



And let me tell you—he can wave a flag and cheer with the best of 'em and—



Then back to bed until the next parade.

Courtesy, Forbes Magazine

In some states, the percentage of those actually voting to the total voting population of the state has been in some elections less than 4 per cent. That is true of the State of Arkansas in the year 1922, when only 32,932 persons voted in the Congressional election, or 3.8 per cent of the voting population of the state. But in the 1920 election in that state 20.8 per cent of the voting population voted. Of course, 20.8 per cent is ridiculously low, but at least that number of voters should have also voted in 1922. We do not single out the State of Arkansas for particular criticism, because there are other states which are almost equally low in the voting percentage, but there is a decided significance in the ridiculously low figure of 1922 when compared with 1920. Louisiana polled in 1922, 4.9 per cent of its total voting population and in 1920, 14 per cent. Mississippi polled in 1922, 7.8 per cent of its total voting population and in 1920, 9.4 per cent. South Carolina polled 4.5 per cent of its total voting population in 1922 and 8.5 per cent in 1920. The total voting population of Georgia is 1,414,772 and in 1920, 148,724 voted or 10.5 per cent, and in 1922, 78,669 or 5.5 per cent. True, these are the figures of Southern states which are so decidedly Democratic that people are indifferent to the result of the election. But the fact remains that the voting privilege is not exercised.

Voting in North and West

Coming to the Northern and Western states, results are better, but not satisfactory. In New York, the voting population is estimated at 5,108,545, and in 1920, 2,895,524 voted or 52.7 per cent and in 1922, 2,526,781 or 49.5 per cent. Pennsylvania showed in the same two years 42.7 per cent in 1920 and 3.3 per cent in 1922. Connecticut showed 57.7 per cent in 1920 and 51.2 per cent in 1922. The California figures were 48.9 per cent and 47 per cent. The Maryland figures were 52.2 per cent and 37.4 per cent for the respective years. The state showing the largest percentage of actual votes to the voting population in 1920 was Delaware with 75 per cent, but in 1922 Delaware voted only 58.8 per cent. These are some of the important states, but they show that a large percentage of the people pay no attention whatever to any election, presidential or otherwise.

The 1922 election was significant and we are constrained to give you the votes of the Senators elected at that time. The following table gives the state, the name of the successful candidate, his political party, his total vote and the percentage of the total vote to the voting population of the state. It will give you a clear illustration of the situation which exists and the necessity of a greater interest on the part of eligible voters in the elections. We do not suggest that any man who was elected would not have been elected if there was a total vote, but these men themselves would have vastly preferred a full vote to the partial vote which they received. Here are the figures:

You must bear in mind that general prosperity depends a great deal upon the action of Congress and of the State Legislatures. Extravagance by elected officials will result in piling up taxes, whereas economy and an understanding of business needs may bring about a relief from many tax burdens, the promotion of economy and the stimulation of industry. The problems confronting Congress today are of the most serious importance. Questions of economic law, decisions affecting finance and industry, the worker, the farmer, the business man and every citizen, come before our national Legislature. That Legislature should represent the will of all the people, and we ought to be able to say fairly that the men in Congress do represent the great bulk of the opinions of the people of the United States. That is not true today, as a result of civic indifference to our own welfare. It may be that business men are not any more lax in this duty than are others, but there should be no laxity any place and we should vote practically 100 per cent strong in every election. Let it be emphasized, however, again, as we have done many times, that it is not at election time that the business men should take an interest, but rather in the period leading up to the selection of candidates, whether it be through convention system or primaries. If the voters will go to the primaries and exercise their power and their right in the selection of candidates, then we shall have a better type of candidate and less trouble in determining on election day for whom we should vote. Because of the fact that our own personal affairs are intimately involved in politics, in the work of the executive departments and in the work of the legislature, it seems incredible that business men should fail to take an interest in the selection of those who are to represent them.

Voter's Apathy Brings "Rotten Politics"

THAT "rotteness of politics" is only due to indifference and apathy on the part of the average citizen, is clearly shown in this article by Mr. Barr.

The intellectual ability and moral responsibility of the candidates of all parties should be carefully considered by every citizen—who should then VOTE.

Call Attention to Primaries

May we suggest that the various industrial organizations throughout the United States, both large and small, should undertake a study of this condition and that one of the duties of the organization be to keep a political calendar and to call to the attention of every member of the organization important political dates and events. We believe it would be a good thing for the Secretary of each organization, a month before the primaries, to send to each member a card calling his attention to the date of the primaries, the names of candidates and a request that he exercise his privilege of voting in the primaries. Two weeks before election a similar card should be sent out and after the primaries and after the election it might be an interesting experiment to send a return postal card asking the member to indicate whether he had voted in the primaries or in the election. This would not cost a great deal and it would be a stimulant and a reminder. It might be well at the same time for each organization, before the primaries and before election, to send out a letter, signed by the President or executive official, calling the attention of members to the necessity of voting in the primaries or at the election and pointing out the intimate relationship between elected officials and the economic problems of the country. If business men will do their political duty, we shall very soon build up a force which will make for better legislation and better government. It is not suggested that "blocs" be formed or that men be picked out because of their ready compliance with somebody's wishes, but rather that a body of men be selected and elected which will typify the intelligence, courage and the patriotic spirit. We want men who understand American institutions, American business, the problems of the American farmer and who are sympathetic with the just aspirations of labor. The man who is intelligent and just will never be responsible for legislation which is oppressive to any particular class or any particular section.

The essential point we desire to make is to illustrate the actual indifference among the voting population today to their duty as citizens and to urge that everything be done to bring voters to an understanding of the imperative and patriotic necessity of voting in the primaries and voting on election day. Let us all exercise this great privilege of citizenship.

Morris S. Rosenwald Dead; Financier, Philanthropist

Morris S. Rosenwald, head of the La-Salle Street (Chicago) investment house of M. S. Rosenwald & Co., and a brother of Julius Rosenwald, President of Sears, Roebuck & Co., died recently at his home after an illness of seven months. Mr. Rosenwald was born in Springfield, Ill., in 1864 and had lived in Chicago for thirty-nine years. His investment house was organized in 1885. He was also president of the Lowenthal Securities Company and a Director in the Drexel State Bank, the Westinghouse Air Brake Company, the Union Switch & Signal Company, the Webster Electric Company, the Walden W. Shaw Corporation and the Consumers Company. He was interested in philanthropy and was a member of a number of clubs. He is survived by his widow, Mrs. Mae Oberfelder Rosenwald, two daughters, Katherine and Eleanor, and one son, Richard.

Sale of Gas Tripled

Since 1901 the sale of manufactured gas in the United States has more than tripled. The total sales in 1901 were less than 102,000,000,000 cubic feet while in 1922 sales amounted to 319,000,000,000 cubic feet.

Zion, Unique City, Broadcasts Itself

Voliva's Industrial and Religious Center Near Chicago Has Powerful Radio Station—Tells World of Activity

ON the shores of Lake Michigan, midway between Chicago and Milwaukee, two graceful steel antenna masts tower 150 feet above Zion, the unique city nded by the late Dr. John Alexander wie. They mark the site of station BD, the radio telephone broadcasting ion owned and operated by Wilbur nn Voliva, General Overseer of the ristian Apostolic urch.

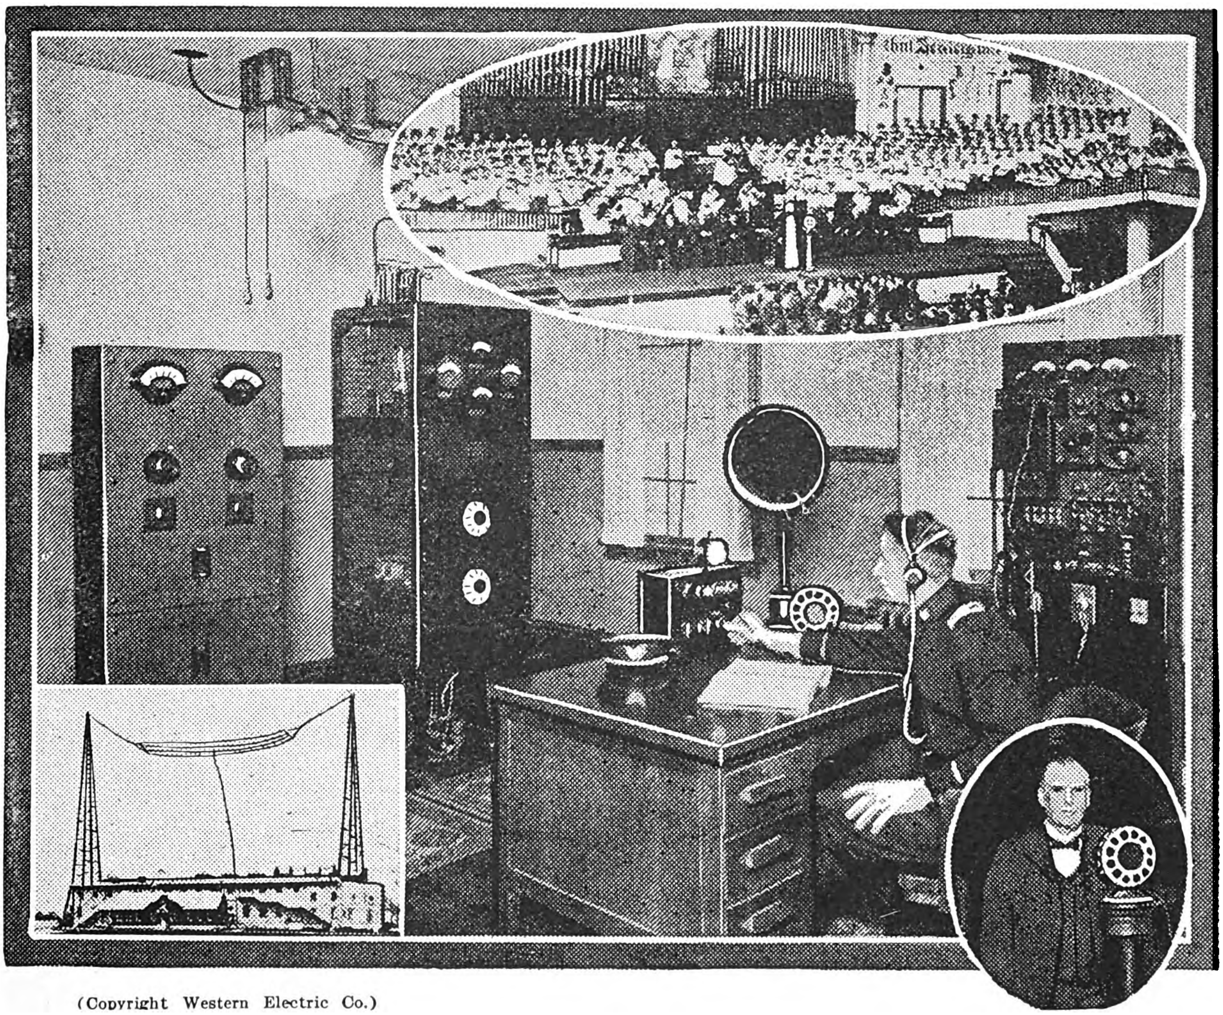
Station WCBD, of Class B type, is ategically situated perfect transmisn on a level plain few miles South of Wisconsin boundr, where there are elements to disturb nsmission. On the mple site, abutting famous Shiloh Tabacle of Zion, a struce costing about $50,0 has been erected house the station. e equipment consists a Western Electric 0 watt radio teleone broadcasting uipment, using Heisg constant current thod of modulation.

Visitors are always lcomed both at the ation and at Shiloh bernacle; this is no rbidden City within ich no man may me unless he shares e religous tenets of e citizens. Those who sit the station — and ey number 500 each nday — are ushered to a spacious recepon hall, comfortably rnished.

Nowhere in the orld, so far as we ow, is there another city like Zion—a ty with a wonderful organization, not ly religious, but industrial, capable of ving almost entirely within itself. With population of only about 6,000, its anual business is in excess of $4,000,000. ach manufacturing plant and retail store , in a manner, independent of every other lant or store, yet all are under the direcon of a single man—Overseer Voliva—ho has proven himself a capable indusial manager. No industry is subsidized; must be self-sustaining or out it goes..

Some of Zion's industries are nationally famous, such as its lace factory, introduced many years ago when Dowie was the leader of the colony. But lace is no longer the only big product of this thriving little city.

Few outsiders know what pains are taken to educate the citizens of Zion in music, that it has a Conservatory with more than twenty paid teachers and nearly 1,000 students—taught free in all branches of music and theory of music composition.



(Copyright Western Electric Co.)

BROADCASTING SERVICES DIRECT FROM SHILOH TABERNACLE

Large Photograph Shows Apparatus Room at Station WCBD; inset, lower left—Station Antenna and Shiloh Tabernacle; inset, above—White-robed Choir of 500 Voices Broadcasting; inset, lower right—Wilbur Glenn Voliva at the Microphone.

The Zion General Store has twenty departments, each independent of the others and each expected to be self-supporting. Some articles, like drugs and hog products, are forbidden because of religious beliefs, but nearly everything else may be purchased in this big store, which does an annual business of something over $1,000,000. Salaries paid employes in the store, according to William E. Schmalfuss, Manager, will average higher than for similar work outside of Zion, while living costs are, he says, considerably lower.

Fig-bars for the Nation

The printing plant is operated day and night and does an annual business of close to $500,000. Two weekly newspapers are published here, but the greater part of the business is commercial. The bakery is the largest institution of this kind between Chicago and Milwaukee, employing more than 200 men and girls, and turns out over $1,000,000 worth of product a year. One of its biggest items is fig-bars, which have a national reputation and are shipped all over the country, from Portland, Me., to California.

Other interesting plants are the apron and handkerchief factories, and, of course, the lace factories which first gave Zion its reputation as an industrial center.

One unique feature of all these plants is that in each is a small chapel or assembly

(*Continued on page 24*)

TRANSPORTATION

Railroads With Heavy Commuter Traffic, Plan New Type of Car; Lighter Coaches, Greater Seating Capacity

PLANS for remodeling the equipment of commuters' trains, especially where the suburban traffic is largely only a short haul, thereby increasing the seating capacity of cars about 25 per cent. are under consideration by a number of railroads. Among them are the Illinois Central, Pennsylvania, New York Central, and several Eastern roads. The Missouri Pacific has recently put in service thirteen coaches of the new type.

The new cars will be much lighter than the present style of suburban equipment, while at the same time increasing the seating capacity. They will weigh about 118,000 pounds and will seat 117 passengers, against the present weight of 135,000 pounds and a seating capacity of eighty-eight. This means a car reduction weight per passenger of about 33 per cent.

Instead of having a double seat on each side of the aisle, as in the present cars, the new design provides a seat for three persons on one side of the aisle and a seat for two on the other. It affords ample space for passengers to move two abreast without undue interference in the aisle. The seats have no arms, which adds considerable to the ease of passage through the aisle and of entrance into the seats.

Figures recently prepared by the New York, New Haven & Hartford Railroad show the percentage increase in commuter traffic coming into the Grand Central Terminal, New York City, in relation to the regular passenger traffic. These percentages follow:

	Regulars Per Cent.	Commuters Per Cent.
1890	61.34	38.66
1896	59.75	40.25
1900	55.61	41.39
1910	52.79	47.21
1920	50.08	49.92
1922	42.39	57.61

Similar traffic conditions are said to exist at several other terminals in the country. The readjustment of equipment not only would decrease the trackage room required for handling a given number of passengers, but would greatly decrease the weight of trains in proportion to the number of passengers.

42½% to G. N. Ry. Employes

Although charges for transportation services were only 35 per cent higher, the operating costs of the Great Northern Railway Company were 85 per cent higher in 1923 than in 1915, according to an official statement. As a result, the return to the owners of the railroad in 1923 was 28 per cent less than that for 1915. Employes received 42½ cents of each dollar taken in by the railroad. Taxes, rents and interest absorbed 16½ per cent, and repairs and improvements 12½ per cent.

New Equipment on Great Western

Since the first of the year the Chicago Great Western Railroad has put into operation four new 70-foot steel baggage cars of the latest construction—one with full end doors. This latter type is in great demand for theatrical traffic, the Great Western serving a considerable volume of this business between Chicago and Minneapolis and St. Paul. The Pullman Company has also assigned the Great Western four new 72-foot steel, open section drawing room standard sleepers, just out of the shops. These cars embody every new feature, such as semi-compartment sections with the small sliding headboards, improved individual heat control, larger ladies' dressing room, folding baggage rack instead of hammocks for the upper berths drop headrests for the lower berths affording more room for personal effects. Windows have air intakes in bottom sash. The interior finish is the most luxurious and attractive ever furnished in Pullman cars. These new cars will operate on Great Western trains Nos. 1 and 2, between Chicago, Rochester, and St. Paul-Minneapolis.

C. P. Ry. Plans World Cruises

The Canadian Pacific Railway Company is planning cruises to the Mediterranean Sea and around the world for 1925. The "Empress of France" will leave New York Jan. 27 and, unlike this year's cruise by that vessel, will circumnavigate the globe, returning via the Panama Canal and arriving at New York by June 1. One of many interesting features of the cruise will be a call at Haifa, Palestine. From this point an excursion to Jerusalem will be conducted. There also will be a short excursion to Cairo, Egypt.

The "Empress of Scotland," which is on a cruise to the Mediterranean, will make another under Canadian Pacific direction in 1925. She will leave New York Feb. 9 for Madeiro, Lisbon, Cadiz, Gibraltar, Algiers, Athens, Constantinople, Beirut, Haifa, Alexandria, Naples, Monaco, Cherbourg and Southampton.

Reduction on Dairy Cattle Rates

Instead of a 30-day reduction in rates on dairy cattle, moving from Eastern terminals to North Dakota and Montana, as first announced, a 139-day reduction of 25 per cent has now been made by the Northern Pacific Railway. The reduction will be in effect from April 15 to August 31, inclusive, according to a statement issued by H. W. Byerly, General Immigration Agent of that road.

Sisal Imports by U. S.

United States imports of sisal amounted to 100,032 tons in 1923, valued at $10,922,066, as compared with 79,458 tons, worth $8,210,264, in the previous year, the Department of Commerce reports. Mexico supplied 75,309 tons, with a value of $7,168,501, in 1923, a considerable increase over the 66,352 tons, valued at $6,452,268, received from that source in 1922. Of the remainder of the 1923 imports, 6,008 tons came from Europe and represent reshipments to a large extent.

PROPOSAL

1. **PURSUANT TO THE REGULATIONS** of the Interstate Commerce Commission, prescribed in its **ORDER** dated October 6th, 1919, in Docket Ex Parte No. 54, The Michigan Central Railroad Company hereby requests bids and hereby gives notice that it will receive bids for its requirements until June 30th, 1924, of the following: Sheets, black, galvanized and blue annealed; steel bars, shapes and plates, including fire box and boiler; spring steel; nails, steel wire; steel billets; axles, car and tender truck, axles for axle light system, driving and trailer truck, engine truck; crank pins and piston rods; to be delivered from time to time as desired by said Railroad Company, at points shown on and in accordance with specifications hereinafter prescribed.

2. Bids must be submitted and addressed to the undersigned at his office by 12:00 o'clock noon, Eastern Standard Time, Friday, April 18th. Bids received after that time will not be considered.

3. Bids must be prepared and submitted on the forms prescribed in the regulations mentioned above, which forms will be furnished on request by the undersigned. Bidders may bid on individual items if desired.

4. Bids will be opened in public at 2:30 P. M. o'clock Eastern Standard Time, April 18th, 1924.

5. The successful bidder will be required to enter into and execute proposed Contract No. 2, series 1924, for the delivery of such material.

6. The right is reserved to reject any and all bids and to accept any part of any one bid.

7. Complete specifications now on file in the office of the undersigned, and said specifications can be inspected and examined free of charge during business hours of any business day by any persons who may desire or propose to submit bids and upon request of any such persons copies of said specifications will be furnished and forwarded to them.

Manufacturing Locations for Sale

Along the line of the Chicago, West Pullman and Southern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad, the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound, with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Chicago, West Pullman and Southern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

For complete information, including rates for transportation and prices of land, apply to

FOREIGN TRADE

Two Foreign Trade Conventions, Important to Exporters of the Nation, to Be Held in Cleveland and Boston

TWO important foreign trade meetings will be held in the near future. Both are of importance to manufacturers and business men of the Middle st who are interested in export trade. first will be the fourth sectional for- n trade conference under the auspices the Cleveland Chamber of Commerce, be held in Cleveland on April 8. The er is the eleventh National Foreign de Convention, under the direction of National Foreign Trade Council, to be ld in Boston on June 4, 5 and 6.

Export managers and industrial leaders m the Great Lakes and neighboring dis- cts will gather at the Cleveland conven- n, which will address itself chiefly to reign markets—of especial interest to the iddle West. This convention will be ven the support of the Federal Bureau Foreign and Domestic Commerce, which ill be represented by a number of Gov- nment experts. Dr. Julius Klein, Director of the Bureau, will be one of the speakers, as will also several other officials of the Bureau.

World trade from the Middle West has shown a marked increase during the past few years, but the opportunities for further business are practically unlimited.

Indications are that the foreign trade convention in Boston, under the National Foreign Trade Council, will be one of the most successful of its kind ever held, according to O. K. Davis, Secretary of the Council. This is the first time the convention has been held in New England, the birthplace of American industry. The central theme of the convention will be "Our Need for Wider Markets."

This is also the first time that a session specially devoted to the interests of importers has been included in the program. It will be held in co-operation with the National Council of American Importers and Traders.

In sending the call for the convention to all Americans engaged in foreign trade, or connected with any factor of our international commerce—agriculture, education, industry, finance, or transportation—James A. Farrell, President of the United States Steel Corporation and Chairman of the National Foreign Trade Council, has cordially invited all Chambers of Commerce, Boards of Trade, National and State Associations, and other industrial and commercial organizations, to be represented.

Mr. Farrell declared that the present foreign trade situation of the United States offers an inspiration and encouragement to American foreign traders.

The program will be an unusually interesting one, as is indicated by the preliminary program. The names of the speakers will be announced later.

Avoid Shipping Troubles

Shipments which are lost or which arrive "short" are fruitful sources of contention and dissatisfaction between shippers and their customers. Even when the claims arising from such shipments are expeditiously and satisfactorily adjusted, they represent a direct loss to the carrier and an indirect loss to the shipper.

Responsibility for a considerable percentage of these claims rests with the shipper. Observation of the following precautions will do much toward rendering claims of this character unnecessary. When making bills of lading:

1. State number of packages.
2. Write plainly.
3. Do not make doubtful figures.
4. Use typewriter if possible.
5. Do not use poor or worn carbon paper. See that all copies are lined up properly.
6. Be sure shipping instructions agree with marking on packages.
7. Describe freight fully, accurately, and by names shown in tariffs and classifications.
8. Show actual gross weights on bills of lading and shipping orders.

Change Spanish Patent Law

An amendment to the Spanish patent law has recently been passed containing some strict requirements, according to Berthold Singer. Within three years from date of the patent, an expert must file a certificate alleging actual working of the patent and giving particulars. A government official will verify these statements, and if the "working" is not held satisfactory, a time limit of one month will be granted for compliance with the law, otherwise the patentee must declare in writing his consent to the grant of compulsory licenses. April 1 is the date set for this law to go into effect.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

ALGERIA—9640, basket-making machinery.

AUSTRIA—9662, caustic soda, 50 tons; 9680, oleine; 9662, potassium bichromate in shipments of 10 to 20 tons; rosin; turpentine; 9680, stearine.

BELGIUM—9700, scales, high precision, for weighing diamonds.

BULGARIA—9633, technical and industrial machines.

CHINA—9692, yarns, fine worsted, spun on French system.

COLOMBIA—9709, bridge, suspension, span of 110 meters.

CZECHOSLOVAKIA—9703, flour; 9706, galoshes, for winter season of 1924-25.

EGYPT—9713, nails, wire.

ENGLAND—9710, drums, strong roller hoop, weighing 130 to 140 pounds; 9664, honey, 25 tons a year; 9675, peanuts, good quality; 9664, spices, 20-ton shipments; 9702, typewriters, rebuilt.

FRANCE—9670, sugar, 200-300 tons a month.

GERMANY—9681, corn; 9667, corned beef; 9681, corned beef, best quality; 9667, milk, condensed; 9694, skunk tails for brushes; 9681, rye.

INDIA—9631, fodder-grass cutting and pressing machinery; machinery for distillation of wood grass gum; 9638, machinery for manufacture of combs from horn, tortoise shell celluloid, etc.; 9631, machinery for match making, safety, using bamboo for splints; machinery for felling and converting trees to lumber, hand and power, portable.

IRELAND—9659, agricultural machinery including hoes, spades, feed cutters, cultivating and harvesting machinery, and internal combustion engines; 9686, candle making materials such as beeswax, paraffin wax, and stearine; 9656, radio apparatus and appliances; 9642, rubber stamp manufacturing machinery; materials for making rubber stamps; 9686, candle wick.

ITALY — 9652, automobile accessories; 9648, automobile accessories, shop equipment, and small tools; 9678, canned goods; 9676, barley; 9678, flour; 9648, grain harvesters and threshers, small sizes; 9676, hops; malt; 9678, rice; 9648, windmills; 9678, sugar; 9713, southern yellow pine; 9648, tires.

LATVIA—9673 wheat, Manitoba, No. 1; wheat, hard winter, Nos. 1 and 2.

MEXICO—9671, cattle, Jersey, for breeding and dairy; 9641, ice-making machinery, complete installation, power plant of producers gas.

NORWAY—9637, wire for packing boxes.

STRAITS SETTLEMENTS—9643, trucks, electric battery, for railway stations: 9649, trucks, electric battery, for railway stations.

SWITZERLAND—9653, rear axles for trucks, 4-wheel.

SWEDEN—9632, brewery machinery; office appliances; 9645, automobiles; automobile accessories; 9632, radio apparatus.

TURKEY—9658, advertising signs; dry batteries; electrical supplies; 9687, furniture specialties; leather for upholstering furniture; sole leather; swivel chair mechanism.

URUGUAY—9660, methanol, 100,000 kilos, for denaturing alcohol.

VENEZUELA—9704, gymnasium supplies and equipment; sporting goods.

SALES MANAGEMENT

Essential in Salesman's "Approach" is Attention of Customer—Don't "Size Up" Prospect; Let Him Decide

C. T. Noble

Salesmanship and sales management, as a branch of industry and commerce, is commanding much more attention every year. It is a natural result produced by natural causes.

The practical use and universal adoption of all modern improvements can easily be traced to salesmanship. It required extraordinary selling and organizing ability to gain the world-wide introduction and adoption of the telephone and thousands of other necessities of the present day.

To equip a modern plant to produce a standard product in immense quantities is largely a mechanical and engineering accomplishment; and even in this salesmanship enters largely into the procedure, and when completed the real problem is to dispose of the product. In this problem we must deal almost entirely with the human element. This is anything but mechanical, and at this point we must look to the sales development to keep the wheels of progress going.

Every man has a buying-face and a selling-face, and the regular routine must necessarily pause to be enlightened regarding the new order of things.

In a general way we could define salesmanship as "the art of presenting advantages of an offer in an appealing manner which suggests favorable action."

The first essential on the part of any salesman is a thorough knowledge of his commodity; granting, of course, he possesses the necessary and essential qualities of honesty, good health, education, clean dress, sincere personality, reasonable aggressiveness, and loyalty. Salesmen are not born salesmen; on the contrary, they are made through personal effort and proper training. Salesmen become resourceful, tactful, and enthusiastic through study, experience, hard work, and, last but not least, by being honest with themselves.

Salesmanship includes a constant study of other professions, particularly advertising—direct and indirect—in all its branches, and the profession is so closely identified with sales that one cannot exist successfully without the other.

By C. T. NOBLE

Sales Manager, Illinois Manufacturers' Mutual Casualty Association, Inc.

THE author of this article, Mr. C. T. Noble, is a salesman of wide experience. He was formerly connected with the Sales Department of the National Cash Register Company, and has enjoyed twenty-six years of successful selling experience. This article, and the one to follow it, should be of especial interest to young salesmen.

There are three types of selling—wholesale, retail and specialty.

It would be impossible to bring together a group of practical selling plans which would apply to every type of selling, but the principles of good salesmanship are the same regardless of what you are selling.

The first necessary step in making a sale is to secure the attention of the prospect. This is accomplished in retail selling through advertising in various forms, depending on the nature of the product and the particular prospective trade. Display advertising appeals more strongly to the prospect because it produces an immediate psychological stimulation or excitation of nerve processes, as it impresses the brain through the eye. The optic nerve, leading from the eye to the brain is twenty-five times stronger or greater than the auditory nerve, leading from the ear to the brain; hence the impression is about twenty-five times stronger, and the salesman should never forget that demonstrations, where possible, are his strongest arguments.

A well-arranged window display often accomplishes the first three important steps in the sale, namely, attention, interest and desire—all through the eye.

Wholesale selling necessitates a thorough knowledge of the goods that should be sold and a knowledge of the type of customers. You work against your immediate success if you undersell your buyer, and you are working against your future success if you oversell him. It is, therefore, important that the right relations with the buyers should be maintained in order to lay the foundations on which bigger sales can be built.

Specialty selling places upon the salesman the burden of getting the attention, the interest and creating the desire, and much valuable assistance can be rendered to the salesman through intelligent co-operation on the part of the sales management by proper advertising directed to the prospect. But this matter should be given careful thought; it should be of the highest standards, new, original, and attractive.

In the approach, the salesman should dismiss from his mind all thought of "sizing up" his prospect and forget this much-abused idea entirely. It cannot be done successfully, and guessing on his part will cost him ten times as many sales as he can possibly get by attempting to "size up" any prospect. Give every person a chance to buy. Take it for granted that everyone can buy and might buy, rather than determining that some person will not buy. Let the prospect decide. Never be afraid of flattering his vanity. Do not decide for him. The retail haberdasher salesman is often surprised when the rough, husky Westerner displays a big roll of $50 bills and purchases a dozen fine silk shirts. Don't try to size up a prospect who shows any interest. You can't do it any better than you can guess how much money he has in his pockets. Stick to the line, be tactful, considerate, pleasant. Don't grin if you can't smile.

Experienced salesmen should be able to anticipate in advance all the usual objections and be prepared to beat his prospect to them, and should lose no time in disarming the prospect of these objections, thereby saving time and avoiding discussions and arguments. When you have disarmed the prospect of objections, let the prospect talk. Don't interrupt him in any way, for this gives you a splendid opportunity to get his point of contact. Never indulge in an argument. It is too easy to win the argument at the expense of the order.

Salesmen should study the power of suggestion and learn to carefully direct their questions in such order that their answers will be logically in their favor. It is equally important to avoid direct questions that might suggest unfavorable replies, for the reason that these replies establish a turning point in the prospect's mind. Make use of the power of suggestion only in the right direction.

The old saying, "Preparation precedes power," can be applied to successful salesmanship as a necessity Neglect of proper preparation is responsible for an extremely large percentage of failures.

AUTOMOBILE—AVIATION

THE average owner of an automobile seldom gives a thought as to the tremendous industry that is behind the automobile he drives. Directly and indirectly the industry supports more than 7,000,000 persons in the United States.

Some idea of the vastness of this industry is shown by the Velie Motors Corporation of Moline, Ill., in estimated figures of the amount of raw material necessary during the present year for the manufacture of the motor cars.

Automobile manufacturers are generally reporting a greater demand than a year ago. In the case of Velie, this company sold 90 per cent more cars last February than during the same month of a year ago, and its production for the first six months of the year will far exceed the same period in 1923.

The figures cited by the Velie Company for raw materials to be used in the automobile factories of the country are based on the assumption that the demand for cars will show a material increase over a year ago. Present indications point to the consumption of 3,000,000 tons of iron and steel; 75,000,000 pounds of aluminum; 110,000,000 pounds of copper; 30,000,000 square feet of glass; 20,000 tons of lead; 9,000,000 pounds of nickel; 4,000,000,000 tons of coal; 9,000,000 gallons of paint and varnish; 40,000,000 pounds of hair and padding; 500,000,000 board feet of lumber; 130,000,000 square feet of imitation leather; 15,000,000 yards of upholstery cloth and 100,000,000 square feet of upholstery leather.

The average automobile of today weighs less than 3,000 pounds.

Auto Production Heavy

Automobile output is running close to the heaviest on record, though it is still early in the year. The Department of Commerce has just announced the February production of automobiles based on figures received from 186 manufacturers, 96 making passenger cars and 119 making trucks (29 making both passenger cars and trucks). Data for earlier months include 12 additional manufacturers now out of business, while February data for 9 small firms were not received in time for inclusion in this report. Figures on truck production also include fire apparatus and street sweepers. It appears from this statement that 336,363 passenger cars were turned out in February 1924, against 254,773 in February 1923 and only 109,171 in February 1922; also that the number of trucks was 31,072 in the month this year, against 22,161 and 13,350, respectively, in 1923 and 1922.

Comparative monthly production of passenger cars for 1922 and 1923 and for the current year of 1924 follows:

	Passenger Cars.		
	1922.	1923.	[illegible]
January	81,696	223,819	[illegible]
February	109,171	254,773	[illegible]
March	152,962	319,770	......
April	197,224	344,639	......
May	232,462	350,410	......
June	263,053	337,362	......
July	225,086	297,330	......
August	249,492	314,373	......
September	187,694	298,911	......
October	217,566	335,023	......
November	215,352	284,923	......
December	208,010	275,434	......

The following table shows the comparison, month by month, of the output of trucks:

	Trucks.		
	1922.	1923.	[illegible]
January	9,576	19,720	[illegible]
February	13,350	22,161	[illegible]
March	20,022	35,260	......
April	22,640	38,056	......
May	24,097	43,678	......
June	26,298	41,145	......
July	22,046	30,663	......
August	24,692	30,829	......
September	19,462	28,638	......
October	21,795	30,166	......
November	21,949	28,070	......
December	20,354	27,743	......

Transport Truck Receivership

Roland A. Crandall of Chicago, has been appointed Receiver of the Transport Truck Company, Mt. Pleasant, Mich., and John Taylor Booz, Chicago attorney, represents Mr. Crandall in legal matters. This is an operative receivership and the manufacture of trucks will be continued.

"While the Transport Truck Company has suffered some severe losses during the past two years, yet the amount of its assets is several times that of its liabilities, and the operation of the factory under receivership will enable it to make payment in full of all indebtedness and perfect a reorganization," says Mr. Crandall.

M. A. Holmes, President and General Manager of the Transport Truck Company, has been placed in full charge of the Company's affairs by the receiver.

Fiat Agency in Chicago

The American branch of Fiat Automobiles has established a new agency in Chicago according to Percy A. Peyser, American Manager in New York. The Chicago agency is the Enterprise Automobile Company, 4042 Michigan Avenue. Charles W. Huck, long an authority on foreign cars, is President of the Company.

General Motors recently mailed dividend checks to 48,568 common stockholders of record Feb. 25. The total number of stockholders of all four classes—7 per cent debenture, 6 per cent debenture, 6 per cent preferred and common (no par)—is now 70,009, compared with 68,063 in the preceding quarter.

CONSTRUCTION

BOND

"The Paper of Known Substantial VALUE"

FIRST impressions do count and they mean just as much in the letters you write as in the interviews which your salesmen secure to sell your goods.

The first impression which any letter makes depends on the stationery on which it is written. For as you have frequently heard —"Your stationery is your business photograph."

You can secure, if you are willing to pay the price, impressive stationery which ***advertises*** its ***expensiveness*** and, theretofore, inevitably suggests extravagant methods, high prices and fat profits—or you can use CONSTRUCTION BOND, the Paper that makes Impressive Stationery at a USABLE PRICE.

Construction Bond is known to be less costly for its quality than other fine bond papers because it is marketed not through local jobbers a ***fraction of a ream*** or more at a time, to any printer or lithographer who will buy them, but ***direct*** to ***responsible*** printers and lithographers throughout the United States, in quantities of ***500 lbs. or more*** at a time.

Thus every sheet of Construction Bond goes into your business stationery ***minus*** the usual jobber's profit, ***minus*** his expenses of handling small lots, minus his losses on small and questionable accounts—only the expenses essential to perfect distribution and service are left.

The next time you order stationery be sure to specify Construction Bond, "The Paper that makes Impressive Stationery at a Usable Price."

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

BUSINESS AND FINANCE

By C. W. SILLS*
Vice-President, Halsey, Stuart & Company, Chicago

IN his discussion of Sources of Capital, Mr. Sills explained two of them in his last article—the individual and the business concern. In this article he explains two more of these sources—commercial banks and the Federal Reserve Bank.

III

THIRD, commercial bank. In discussing the subject of capital supply, the so-called commercial banking institutions of the country, by which I mean the National, state, savings, private banks, and trust companies, stand out pre-eminently as the most important institutional source. There are on deposit with this group of institutions not only the funds of individuals, but those of business concerns, as well as the deposits of civic and governmental bodies. These deposits serve as the basis for the loaning and discounting activities by means of which the capital requirements of industry are provided, the bank acting as intermediary, collecting the surplus capital from those who do not need it, and providing its use to others who do need it to carry on their activities.

As of June 30, 1923, the report of the Comptroller of the Currency for December, 1922, gives the total number of banks of all character engaged in the commercial banking business in the United States and territories as 30,178.

The aggregate resources of these banks represent the enormous total of $54,034,911,000, with deposits—including dividends declared but not paid and postal savings deposits—amounting to $40,034,195,000, and capital stock, surplus and undivided profits of $6,797,006,000.

Examining the report of the Comptroller of the Currency as of June 30, 1923, in the light of banks as the source of capital supply, it is significant that the loans and discounts of $30,416,577,000 are well over twice the item of investments, consisting of stocks, bonds, mortgages and other securities of $13,672,547,000. While these two items, of course, vary from month to month and year to year in amount and relationship, it will give you in a general way the extent to which banks, as classified, are a factor in supplying short and long term capital requirements of industry.

In the eyes of the layman, these tremendous sums are utterly incomprehensible, but in their contemplation it is not hard for us to understand the powerful influence which the shifting of these two items exerts upon financial conditions.

FOURTH, the Federal Reserve Bank. While the commercial bank in normal times is a source of capital supply, abnormal conditions sometimes reverse the situation so that the bank in turn becomes a borrower requiring additional capital in order that it may continue to function. And this is the chief function fulfilled by the twelve great Federal Reserve Banks of the country. They are bankers' banks to which the commercial bankers may appeal in case of need, either for additional credit in order to increase their loaning capacity or to replenish their stock of currency. In these twelve banks is deposited the gold reserves of member banks thus becoming ge central reservoirs of capital available at all times to strengthen any weakness which might develop in the banking structure. These Federal Reserve Banks may likewise borrow from each other if a serious drain on their resources develops and providing the situation is not altogether contemporaneous over the entire country.

A commercial bank borrows from the Federal Reserve Bank by means of the process of re-discounting the commercial paper held by the bank with the Reserve Bank in its district, in a manner exactly similar to the bank's discounting commercial paper for a customer. By rediscounting, the bank may receive at its option either a credit balance with the Reserve Bank or Federal Reserve Notes. Thus, in this way, banks have an additional source to draw upon even after their own credit resources are rendered inadequate in meeting their local demands.

I have not time to tell you of the organization or operation of the Federal Reserve System or of its vital functioning during the war period and the inflation period immediately following, but I can give you some idea of the expansion and construction which took place by stating the condition of the twelve Federal Reserve Banks at the peak of the inflation and deflation periods as regards their reserves and deposit and note liabilities. The high point of credit expansion was reached on Nov. 5, 1920, when the combined note and deposit liabilities reached $5,205,710,000 against total reserves of $2,169,729,000 or a ratio of 40 per cent. November 5, 1920, marked the beginning of the period of deflation, and from this date on to July 26, 1922, not only note and deposit items decreased over a billion dollars but there was likewise an increase in the reserves due largely to the liquidation here of credits by foreign countries so that the reserve ratio rose to 79.2 per cent. The current position of the Federal Reserve Banks shows still further improvement, the reserve ratio of total reserves to combined note and deposit liabilities as of Jan. 30, 1924, being 81.3 per cent.

(To be continued)

(*Continued from page 13*)

room, where the employes gather each morning before work and spend fifteen minutes in prayer. After a recent industrial survey of Zion, the interviewer said regarding this feature:

"As far as we could see, the religious practices of the workers did not lessen their efficiency. One of the managers naively explained that the time spent in devotion was outside of the regular working hours. The workers, he said, voluntarily appeared at the plant fifteen minutes before the regular starting time. We thought the idea was a pretty good one, as it assures the workers being on the job in time."

Concerts from the radio studio WCBD are produced every Monday and Friday evening at 8 P. M., and every Wednesday and Friday afternoon from 2:30 to 3:45 P. M. On Sunday mornings, from 9 to 9:30, programs by the Zion orchestra are broadcasted from a studio in the Tabernacle. On Sunday afternoons from 2:30 to 5:30 the principal service is broadcast from the Tabernacle direct. During this period there is an organ recital or special music by the Zion Band and Zion white-robed choir of 500 voices. The wave length is 345 meters.

Programs Broadcast by WCBD

The programs of WCBD are made up of numbers by the Zion Junior Choir of mixed voices of 150 children ranging from 8 to 12 years of age, Zion Male Choir of forty voices, Zion Women's Choir of twenty voices, Zion Band of fifty pieces, Zion Orchestra of forty pieces, and the Zion White-robed Choir of 500 voices. It is said that this is the largest choir that sings regularly every Sunday.

Wilbur Glenn Voliva believes that radio is a universal boom which promotes better understanding among the peoples.

Discussing the fact that radio telephone broadcasting has removed the physical limitations of distance, Mr. Voliva estimated that in one week's time his voice, flung afar by the antenna of WCBD, has in all probability been heard by more persons than he has addressed in the previous sixteen years he had preached when only those within the normal range of his voice could hear him. It should be considered, too, that the assemblages he addressed in those days thronged some of the largest auditoriums in the country.

Chicagoan Brings British Oil Invention to America

An invention by Edward Fuller Heath for the treatment of residue oil, known as the "Lennox process," by which residue oil, hitherto wasted, will produce large quantities of gasoline, has been obtained from the British inventor and brought to this country to be put into operation at various independent oil refineries. The sole American rights to this invention have been obtained by William H. Stevenson, Jr., an official of the American Trade Corporation of Chicago, and son-in-law of Hon. Charles J. Vopicka, former United States Minister to the Balkans.

The new "Lennox process" does away entirely with retorts, and the maximum temperature in this process does not exceed 212 degrees Fahrenheit, as against a temperature of between 800 and 1,000 degrees Centigrade, which has to be obtained in all known cracking outfits in production of aromatic hydro carbons.

Another advantage over the usual methods is, that whereas a loss is sustained in tar and gas, in the "Lennox process" this is overcome and the result in one run has been 66½ per cent benzol (Class Spirit) as against a maximum product in present day plants of 25 per cent.

"Webster From the Air"

"Webster From the Air" is a unique prestige-building direct mail advertising booklet recently issued by Warren Webster & Co., steam specialists, of Camden, N. J. The booklet, well printed in two colors, is graphically illustrated with aeroplane photographs of the principal cities in the United States in which the Company has offices or headquarters. It required over eight months of hard work for the Company to gather these photographs, which were obtained from seventeen different sources. Harold F. Marshall is Advertising Manager for the Company.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

ONSTRUCTION of a superpower system in Illinois, with Chicago as the is announced by the Commonwealth on Company in connection with its r of a 1,000,000-volt testing set which be built by the General Electric Com- y.

his is the first 1,000,000-volt set ever alled by a public utility operating com- y. Because of the rapid expansion and probable future development of the trical distribution system supplying cago and outlying territory, high volt- become necessary for purposes of ing and research.

he new laboratory will be located ad- nt to the Northwest generating station the Commonwealth Edison Company, is being designed by engineers from h that Company and the General Elec- . The building which will house the oratory will be 100 feet by 80 feet, l will be of sufficient height to permit ple crane clearance. Around the pit l be an observation gallery, from which itors may view the tests.

When completed and equipped, the lab- itory will be used for experimental re- rch on the problems arising from high ltages which are being used in the oper- on of the superpower system rapidly reading out from Chicago.

The Commonwealth Edison Company is w supplying current to a population of out 3,000,000 in the city of Chicago, and s a power load of more than 600,000 W., apart from the outlying areas and anufacturing districts which in many ses are supplied by utilities allied and sociated with this company.

The new 1,000,000-volt laboratory will available for all companies under the anagement of Samuel Insull and his asso- ates.

U. S. Census Facts on M. O.

A nation-wide survey, based on compilations of the United States Census Bureau, ows the following facts regarding mu- cipal ownership:

1. The majority of the municipally owned lants are in towns of 1,000 population r less, where funds cannot be raised ex- pt by pledging public credit.
2. The municipal plants produce only per cent of the electricity generated in this untry, and this percentage is constantly ecreasing.
3. The average rate of all municipal lants is more than twice as high as the verage rate of all privately owned com- anies.
4. Municipal plants which have shut own their generating plants since 1917 ave shown a large increase.
5. Of the population of the United States erved with electricity 93.8 per cent receive service from privately owned plants and 6.2 from municipal plants.
6. Approximately 8 per cent of the gross income of private companies is paid direct in taxes and about 11 per cent additional goes to the government as tax on its securities.

Company Changes Its Name

Stockholders of the Wisconsin-Minnesota Light & Power Company met on April 2 and voted to change the name of the Company to the Northern States Power Company and to locate the headquarters at Eau Claire instead of LaCrosse, Wis. The number of directors was also increased from eleven to seventeen.

Record Electricity Output

The average daily production of electricity by public-utility power plants in January exceeded all previous records of output, with a production of 167,000,000 kilowatt-hours per day. This figure exceeds the previous records established in November by about 3.5 per cent. The total output for the month was 5,177,000,000 kilowatt-hours. This is the first time that the five-billion mark for a single month's output has been passed. About one-third of the total output was produced by the use of water power.

Hydro-Electric Power Decreases

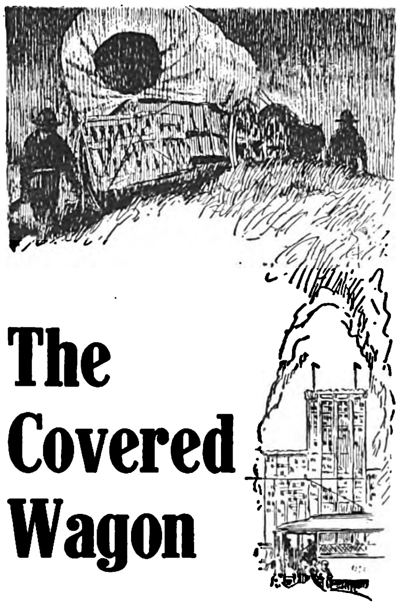
While the total output of electrical energy by the public utility power plants of the United States last year increased 17 per cent over 1922, setting a new high record of nearly 56,000,000,000 kilowatt-hours, the proportion of this prodigious flow of power produced by hydro-electric stations continued a decrease that has appeared for each of the last five years, according to figures recently made public by the United States Geological Survey.

Public Utility Speakers' Bureau

Public utility executives in Illinois recently formed an organization to furnish information regarding public utility problems. The meeting was held in Joliet and the officers are: President—L. C. Stephens; Vice-President—A. H. White; Secretary—C. I. Carlson. It is the plan of the organization to furnish speakers at all public gatherings where questions relating to public utilities may be discussed.

Electric Ry. Assn. to Meet

The American Electric Railway Association will hold its convention in Atlantic City this year. Sessions and exhibits of electric cars, busses and electrical machinery will open Oct. 6.



The Covered Wagon

WINDING its way across the Iowa and Kansas plains, through the treacherous mountain passes, over the burning sands of the deserts, the covered wagon journeyed westward.

After weary months, the pioneers reached the west and built their homes.

Today! A minute—and Chicago is talking with Denver or San Francisco. The covered wagon is a romantic memory. Potent, the throbbing symbol of modern life, the long distance telephone has made the East and West one.

> "What steps does the Republican organization of the Senate intend to take to thwart the efforts of a few sensation-loving Senators, apparently actuated by political motives, to cast aspersion on the Republican organization? Is not the time to take action at hand?"

To this message, Senator Lodge laconically replied:

> "Thanks for telegram. Just what action would you suggest?"

In reply, MANUFACTURERS NEWS telegraphed:

> "Telegram received. Get your organization together. Let every man do his part. Ignore your antiquated precedents. The country is interested in those who are accused only to the extent that they be given a fair and impartial trial, under proper rules of evidence, and that no bribe giver or bribe taker escape. Do not allow the Administration to be crucified by inches to the detriment of our country. Do not permit Senate Committee rooms to degenerate into broadcasting stations for the dissemination of gossip. Avoid muck-raking. Turn your attention to the public business. Be aggressive."

To Senator McKinley, MANUFACTURERS NEWS sent the following telegram:

> "Have the Republican Senators lost their courage? Are they going to continue to sit supinely by and allow a few sensation-loving Senators, apparently actuated by political motives, to smirch the good name of the Republican party?"

Senator McKinley replied with this brief note:

> "Why taunt us so? Here is the situation: there are forty-three Republicans who vote one way, forty-three Democrats and ten LaFollette-ites that vote another way. Do you wonder that we feel cowed?"

The reply sent by MANUFACTURERS NEWS was:

> "We beg to acknowledge the receipt of your letter of March 28, in which you ask: 'Do you wonder we feel cowed?' We certainly do. Why should you feel that way? Have the Senators on your side of the chamber violated any law? Have they done anything that would prevent their arising in their seats and replying to charges even if based on gossip and innuendo?
>
> "There was no intention on our part of taunting you. We were trying to encourage you. We were trying to force action. Surely the members of your group are as resourceful and as intelligent and as honest as their opponents.
>
> "Do you mean when you say that forty-three Democrats and ten LaFollettes-ites are banded against forty-three Republicans, that the forty-three Republicans propose to lie down and give up the ship?
>
> "What is the matter? Are the forty-three Republicans afraid some bricks will be thrown at them? Will the policy of non-resistance get you anywhere? If you want to make friends in the present situation, you must fight."

Packing Industry's Growth Told in Swift's Year Book

The phenomenal growth of the packing industry is graphically told in the Year Book for 1923 recently issued by S & Co. This business was incorporat 1885 with capital stock of $300,000. I Year book then says:

"The capital stock was increased f time to time until in 1900 it amount $20,000,000. It reached $50,000,00 1907 and $100,000,000 in 1918. In 1 it was increased to $150,000,000.

"The total amount paid in dividend shareholders has likewise increased. 1899 the dividend payments first exce $1,000,000. By 1904 they were over 000,000, and by 1912 they were over 000,000. The dividend requirements tod on an 8 per cent basis, call for an ann payment of $12,000,000 to shareholders.

The Year Book for 1923 contains mu valuable information relating to the pa ing industry, in addition to the financi reports of the officers of the Company. F instance, there is the record of live sto receipts, marketing of packing produc and retailing costs, an article on "The Go ernment's Demand for Access to O Books" which may be read with profit b every one studying the constitutional righ of citizens, and several other articles o more than ordinary interest and worth.

Lumber and Logging Register

The 1924 edition of "Abbey's Register of the Western Lumber Industry" has just been issued. It is a complete and comprehensive book of 327 pages, covering every branch of the logging and lumber industry, not only in the big lumber producing states of Washington and Oregon, but the entire West, including British Columbia and Alaska. P. L. Abbey, Manager of the Industrial Service Company, which published the book, was formerly Executive Secretary of the Loyal Legion of Loggers and Lumbermen, a Northwestern organization of employers and employes, which had a membership of 30,000 employes and 400 operating employers.

Fight Fire on Farms

The National Board of Fire Underwriters is compiling a record of fire losses on farm property in various states covering the period of 1918-1921. The total will run well toward $100,000,000. Chiefly responsible among the known causes of fires on farm property are lightning, defective chimneys and flues, stoves, furnaces, boilers and their pipes, spontaneous combustion, matches, smoking, and petroleum and its products. During the 4-year period of 1918-1921 not less than $4,435,567 worth of Illinois farm property went up in smoke, the great bulk—probably 90 per cent—being from causes that were strictly or partly preventable. For every bit of farm property destroyed, the profits of some farmer are wiped out and the "problems of agriculture" increased just that much, for the farmer must secure new capital with which to replace property destroyed. This must all be charged up against the high cost of production on farms.

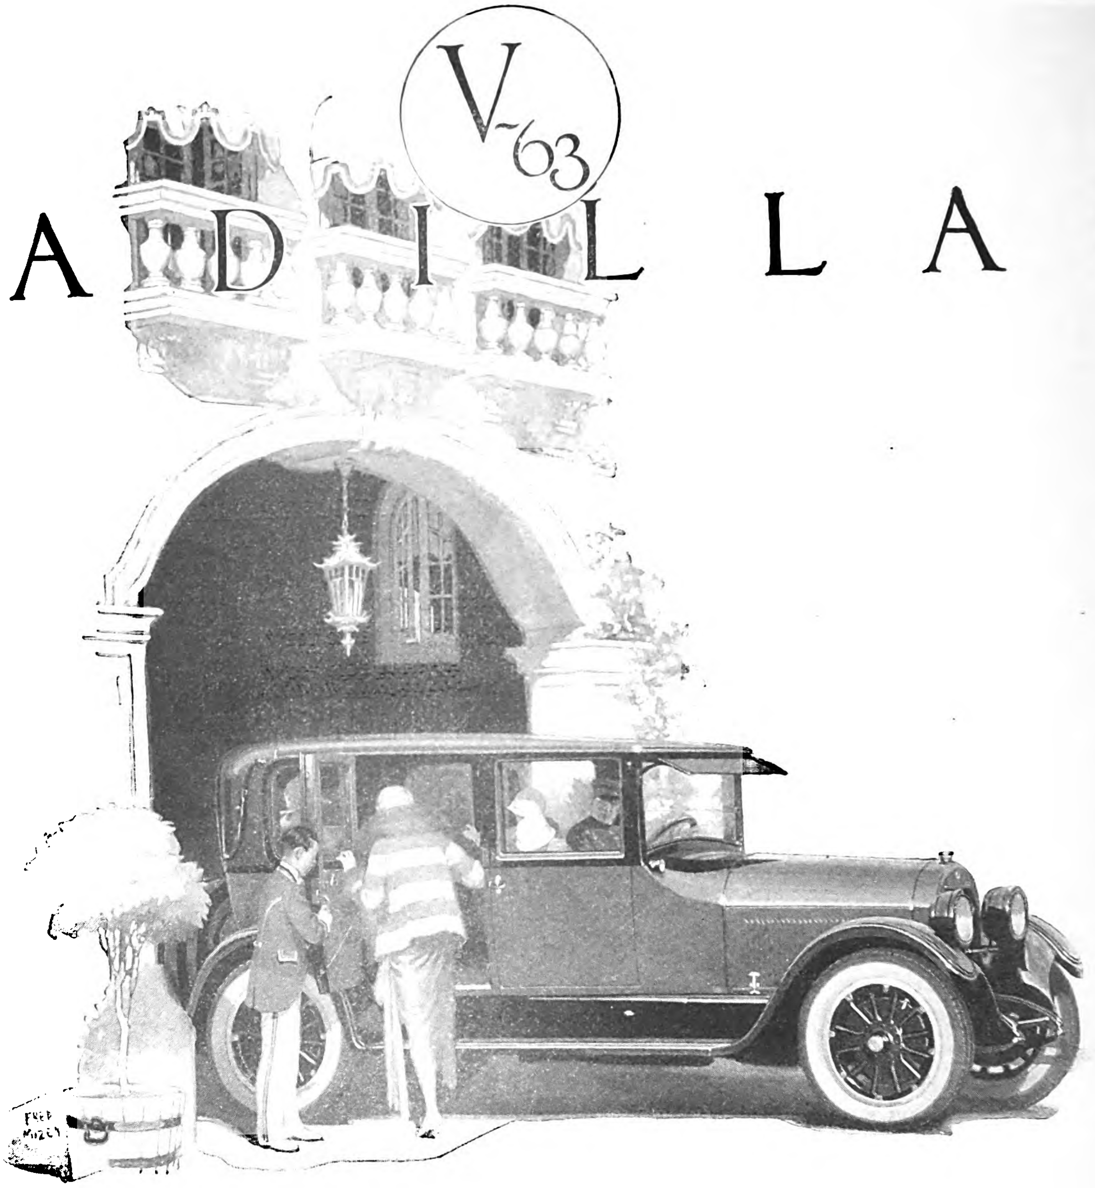
CADILLAC



Those who own the new V-63 Five-Passenger Sedan travel in an atmosphere of richness and refinement. Its body is appointed with the exquisite taste one finds in the most luxurious drawing rooms.

But the compelling appeal of the Sedan, and of all models of the new V-63, is the exceptional performance of its new, inherently balanced engine. An absolutely new principle in automotive engineering has been applied, resulting in the elimination of all perceptible vibration.

When first you drive the new V-63 you will say with others that never before have you experienced such surpassing smoothness of performance.

A National Institution

TO he who is blessed with a modicum of imagination, the Congress register is an inspiring object. From it can be read the glories of travel, the vicissitudes of war, the intricacies of public life. Glimpses may be caught of great laboratories, hospitals, lecture rooms, and of manufactories of astounding magnitude. See, there, a vast assemblage, and a stage whereon maneuver the artists of our country—singing, playing, acting, and responding to the appreciativeness of their audience.

It is to the Congress that the interesting and important people of our land come, when in Chicago. The register reveals their delight in this haven. Year after year they come. New names are found in the list of our nation's leaders, and those names, in due time, find their way to the Congress register. For many years, in many ways, this hostelry has been a national institution, and so it shall continue.

Play More and Smile More

HAVE the American people forgotten how to laugh and smile? Some of us might think so. If you will notice the faces of the men and women who ride in the street cars and elevated trains in metropolitan centers, to their work in the morning and to their homes in the evening, you will seldom see a cheerful, happy smile. You seldom see a smiling face in the streets. But you do see plenty of hard, worried looks, countenances bearing the lines of care, resignation and indifference.

What is the reason? Is it the strenuous nature of modern American life? Is it the struggle to pay rent, to buy fur coats and chiffon hose and to meet the increased cost of girls' hair cuts? Is it the contemplation of the Congressional investigations, the high rate of taxation—or are we simply, all of us, taking life too seriously?

Possibly we have forgotten how to play. The Italian peasant sings in the morning as he drives his goats over the Roman Campagna. The British workman finds time between strikes to sport on Hampstead Heath and to take an active and personal interest in football. The Frenchman is merry while he quaffs his *vin ordinaire.* All of these nations play. They have less worldly goods than the people of the United States, but they take life less seriously.

The Playground and Recreation Association of America, of which Mr. William Butterworth, President of Deere & Company, Moline, Ill., is one of the directors, is doing something to counteract the gloom that pervades large sections of American life. In an article recently appearing in *Nation's Business,* Mr. Butterworth says that playgrounds are a business asset, and it is his own experience that community recreation activities in Moline promote healthier citizenship and make for increased efficiency. He points to the fact that, with the shortening of hours of labor, workers now enjoy greater leisure than ever before and that no plant manager can afford to be wholly indifferent to the conditions under which the many men and women in his employ spend these hours.

LaFollette's Platform

NOW that Senator LaFollette has shot his wad by making public his proposed platform, which will be submitted for the consideration of the Republican National Convention, those who were fidgety about what the Wisconsin Senator proposed to do can resume the even tenor of their way. If there was any real danger it is certainly over. Like all dogs which make a noise, the Senator's bark is worse than his bite. Wisconsin is largely Socialistic, and the LaFollette platform is what one would expect from a group of voters who advocate Socialism.

If Senator LaFollette has any notion of making a grand stand play by walking out of the convention with his delegates and starting a new party, most sensible people will say he is welcome to try it. Socialistic leadership will not attract attention among the delegates who will have seats in the Cleveland convention. Most of the proposals of the platform have been tried on the American people and rejected.

Where Coal Miners Are Needed

JOHN L. LEWIS, President of the United Mine Workers of America, says 200,000 coal miners are out of a job. For Heaven's sake, make plasterers out of them! The maximum scale, including overtime, runs about $200 a week. It is suggested that the Citizens Committee of Chicago wig-wag Mr. Lewis. Plasterers are so scarce in Chicago they can demand $1.50 an hour and upwards, and that will be the aim of the other building trades.

Heigh ho! What's the advantage of a university education?

Senator McCormick's Opportunity

SENATOR Medill McCormick has asked President Coolidge to call a conference of Governors to give consideration to the enormous increase in state, county and municipal taxes. Whether it is a good thing to get these tax eaters together is a question regarding which we do not need to comment now.

We do know that Senator McCormick has enough to do if he will exercise his influence in the Senate and help to bring down the expenses of the Federal Government. We have not been able to see where he has been of great assistance in accomplishing a reduction in Federal taxation. We know he claims to have been the central figure in passing the Budget Law and "everything," but we have never been able to see it from his viewpoint. Hon. James W. Good and Hon. Martin B. Madden were the principal figures, as we remember. He has a chance to redeem himself to some extent by putting his shoulder to the wheel and helping the taxpayers and the people, too, to get Congress to adopt the Mellon Tax Revision Plan.

Tax on Savings Illogical and Uneconomic

LEVYING higher Federal taxes upon incomes and the interest on savings than upon "earned incomes" is a policy more popular than fair.

Men and women, including hard working physicians and school teachers, in the days of their full earning capacity, by thrift and frugality accumulate a few thousands of dollars to provide against the depreciation inevitable with advancing years. This income, for purposes of taxation as now contemplated, will pay a higher rate than the weekly wages of prosperous plasterers and bricklayers.

There is something inherently and economically wrong with the theory that money earned in one's younger years and put in a bank or invested in bonds or stocks should not be regarded as earned income. What else is it? It is this capital, accumulated during the peak period of physical and mental power of the thrifty, that to a great extent furnishes the money to operate public utilities and industries in this country which, in turn, pays the wages of our prosperous working class.

Would it not be more logical and economically sound and an encouragement to thrift to place a tax upon present day earned incomes and relieve from taxation the income on the smaller blocks of invested capital?

Henry Siegel's Compensation

EMERSON, who wrote a wonderful essay on the law of compensation many years ago, if alive today, would find material for his magic pen in the experience of Henry Siegel.

Eleven years ago this 65-year old merchant was a department store king, President of a $10,275,000 corporation, with immense stores in New York, Boston and Chicago. He had a magnificent town house, a palatial country home and rented a place each season in London. Today he is proprietor of a small haberdashery shop in Hackensack, New Jersey.

He lives in a $60-a-month flat and confines his personal expenditures to $10 a week.

Mr. Siegel wastes no time in vain regrets. He rides to work in the street cars. He is happy and healthy. He has less money, but also less worry. He has sloughed off the cares and responsibilities of wealth like a snake's skin.

One Way to Make Good Citizens

A SURVEY of residences built in Chicago in 1923 shows that 5,889, all costing under $10,000, are owned by working people, mostly families in which the heads of the house wear overalls and work in factories and other industrial plants. This was 75 per cent of the residences built in Chicago.

This is the surest form of insurance against the spread of radicalism which destroys property. These working men are capitalists. They are good citizens. They would resent any act by loafers and bums that would take from them the product of their hard labor and thrift.

adiant Future for Radio Forecast

Science of Broadcasting Has Outstripped Legislation; Seeing by Radio One of the Wonders Already a Fact

By **DR. J. H. DELLINGER**

Chief of the Radio Laboratory,
U. S. Bureau of Standards

A QUESTION that is being asked over and over today is how to get the most out of radio. The answer is being steadily worked out by the ›ined efforts of widely differing enter- s—by the thousands of business men e energy is supplying us with radio pment, by the multitude of radio en- ers who are constantly designing im- ements, by the scientists who are dis- ring new principles, and by adminis- ve officials who face the problems of regulating a force that stops at no bar- or boundaries.

uch, indeed, has already gotten out of radio. The lls of broadcasting, the aid comfort to ships and to ex- ers in remote places — I not repeat the well-known s. It is hard to visualize the derful past and present of io, to say nothing of its fu- . Do you realize that con- sation by radio over 4,000 es was accomplished eight rs ago? As its most recent ievement, on Dec. 7 last, it ught into our very homes the ce of our President deliver- his message to Congress. dio has transmitted photo- phs, handwriting and thumb- nts, even across the Atlantic ean. The terror of fog at has been banished by the lio lighthouse. And another le thing—think of the mul- ıdes of folks who are now ing an interest in science ough experimenting with ra- —one of the best things that come out of it.

Broadcasting is here to stay, d it will bring to the whole ople more and more of the ill of participation in the al, worth-while things that e going on. It is clear, how- er, that broadcasting is to ve its ups and downs. The trouble is at, like Mahomet's coffin and doubtful liticians, it is without visible means of pport. The radio audience must be watch- l, and Congress or other authority must vigorous in action, against polution of e ether by objectional matter or by ex- ssive advertising that may be resorted to make broadcasting pay. We shall soon e wide extension of non-radio broad- sting by the aid of electric wire systems, th power wire and telephone, which ill be done with line radio or carrier- rrent methods, entirely independent of the regular uses of the wires. This will relieve the overburdened ether and may, perhaps, furnish a means of supporting the broadcasting by its beneficiaries.

Radio Outstrips Control

The future of radio looks good, in whatever direction you turn. In the next few months we shall doubtless see the beginning of a steady development of cheaper, simpler, and better receiving sets. Radio sets are now in the same stage as the early automobiles when they had a whipstock on the dashboard. Ten years from now it will be hard to believe that the complicated juggernauts we now call receiving sets were used in anybody's living room.

CHARLES RYAN

Courtesy, Western Electric News

Along with the improvement of the sets will come improvement of the users of the sets. I mean sets will be so made that people will no more think of fussing with the set when in operation than they would of varying the speed of a phonograph record in the middle of a selection. We shall certainly see the elimination of batteries and antennas. Perhaps even the electron tubes will go, and crystal detectors come back, if broadcasting is distributed from a sufficient number of stations. These stations will be linked together, so as to send out the same material simultaneously, by any of three methods: wire telephone distribution, radio relaying, or the carrier-current system I have just mentioned. In any case the receiving sets will surely develop so that pressing the proper button will be the whole process of adjusting the set to bring in the particular material desired. One thing about radio sets that now appears certain is that practically everybody will have one.

Broadcasting is not the whole of radio, and perhaps you realize this when you hear some code messages buzzing in to disturb a concert or news you want to hear. This business of radio interference is the real problem of radio today, and there are several things that prove there is light ahead. The principal cure for interference is keeping different kinds of radio messages on different frequencies. Thus the amateurs are down at or below the low end of your tuning dial; ships are, or should be, just beyond the upper end of the dial. Special radio telegraphic services, like the radio beacons for ship navigation, are just above that, and away beyond all the others is the high-power transoceanic radio telegraphy which is now competing formidably with the ocean cables. This process of assigning frequencies is not yet perfected, and is still in progress.

Radio Future is Radiant

Radio has grown so fast it has outstripped the slow process of national legislation and international agreement, and those processes are necessary to the job of parceling out the frequencies so as to avoid interference. The present Congress will consider, and perhaps pass, a bill to give the Secretary of Commerce effective authority over radio stations. There will be a Pan-American conference in Mexico City on May 27 to agree on the control of such radio communications in North and South America as have sufficient power to affect radio outside the country of origin. There will be a similar conference of all the nations of the world, for the same purpose, perhaps within a year, at Paris.

With the way clear for national control of all uses of radio, what new developments can we expect? Certainly one is to be the use of radio on aircraft. Both for conversation between aircraft and ground, and for assisting in the navigation of the aircraft in fog or in the dark, radio will be a large factor in making aviation a feature of our everyday life. Similarly the use of radio on trains will be much more extensive than at present, greatly enhancing both the comfort and safety of travel on land.

I could say a good deal about the things that radio will not do, at least not by any means that now appear reasonable. I will not bore you, however, but will merely leave in silence such things as radio transmission of power, radio curing of disease, and radio transmission of thought or psychic influence.

Radio Realities Seem Wild

I confess that some of the realities of radio, on the other hand, seem almost as wild, and one of these is seeing by radio. This is no dream, but a fact that is being steadily perfected. Probably within five years radio audiences in remote cities will see the facial expressions as well as hear the words of the President or other important speakers on great public occasions in Washington.

As to universal use of radio to communicate between individuals, I think not. Certainly not to such an extent as to supersede the present long-distance telephone. On the other hand, improvements in methods of concentrating the waves in a desired direction, increase in the restriction of the wave to its proper frequency, the use of much shorter waves than at present, these and many other developments by the scientists in various laboratories will steadily increase the extent of the manifold service that radio can render.

1924 Bill for Radio in America Will Be $350,000,000, Says Roger W. Babson

To those who believe that radio is still a fad, adopted only by a small minority of the public who are experimentally inclined, the following statement by Roger W. Babson, statistician and business authority, will prove interesting:

"It has been my experience that very few people realize just how important, from a business standpoint, the radio industry has become. Just because an industry is comparatively new is not a reason for assuming that it is unimportant. The radio industry is new, but it has grown so rapidly in the last two or three years that it compares very favorably with many of the important long-established industries.

"On the basis of figures for the year 1923 it is probable that the American people will spend approximately $350,000,000 for radio equipment during the present year. A conservative estimate of the business in vacuum tubes alone is about $50,000,000. At least five times as much, or $250,000,000, will be spent for radio sets and parts. The sales of batteries, both dry cell and storage batteries, will very likely amount to over $45,000,000. Miscellaneous equipment such as battery chargers, loud speakers and specialties may easily account for $50,000,000 more.

"It is interesting to see how the radio industry compares in dollars and cents with other large industries. Available figures on sporting goods, cameras, etc., show a value of about $185,000,000 annually. Sales of radio equipment are running nearly twice as large as all kinds of sporting goods.

"The value of radio business is nearly twice as great as that of the carpet and rug business. For every dollar spent on furniture 33 cents is spent on radio. For every dollar spent for boots and shoes [illegible] cents is spent for radio. For every dollar spent for musical instruments of all kinds, including phonographs, pianos, organs, etc., 75 cents is spent for radio. The value of radio business amounts to nearly three-fourths of the jewelry business as a whole, including clocks, watches and novelties.

"I have given you these illustrations in order that I might emphasize the growing importance of radio from a business standpoint. It is not necessary for me to tell you of radio's importance from an educational and social standpoint. I see no reason why the industry should not continue to expand. There has been a decided improvement in the character of the broadcast programs, and we may doubtless look forward to still greater improvement in this direction.

"To sum the matter up, radio has passed through the fad stage and has become a utility. It has rightly achieved its proper permanent status among the important industries of the country."

Radio "Fans" Must Pay to "Listen In" In Australia

A novel method has just been adopted by the Australian Commonwealth wireless authorities for protecting broadcasting stations, says a report to the Department of Commerce from Melbourne. The regulations recently promulgated require that every prospective purchaser of a receiving set must present to the radio goods dealer a certificate of license showing that he has subscribed to the service of the station operating on the wave length to which the instrument being purchased is adjusted. If a radio enthusiast desires to "listen in" on additional programs he can have his receiving set so adjusted, but only on the production of certificates showing that he has made separate subscriptions to each.

At a recent conference of Federal authorities, manufacturing, broadcasting companies, and dealers, the adoption of a uniform device for sealing receiving sets was decided upon. While the sealed set regulations may be defeated by certain owners of receiving sets, the Government has authority to make surprise inspections of every set to see that the seals have not been tampered with. It is understood that the sealing device, which is added locally, will in no way interfere with the sale of American radio sets in Australia.

Farmers Like Radio

The importance of radio in the production and marketing of agricultural products is brought out in a special survey of about 1,200 representative farmers by the United States Department of Agriculture. More than 50 per cent of the 1,200 farmers replying reported that they owned tube sets employing three or more tubes, while approximately 50 per cent of the farmers reporting have home-made sets ranging from simple crystal detectors to tube sets. More than 75 different makes were found among the manufactured sets purchased. The average cost of the manufactured sets was $172. The average cost of crystal sets was $11. The average cost of the home-made tube sets was $83. Eighty per cent of the farmers said they were interested in receiving both weather and market reports. The survey was made in practically every state in the Union.

M. W. Jack, American Bottle Co. Head, Dies at Streator

Matthew William Jack, a former Director of the Illinois Manufacturers' Association and a resident of Streator, Ill., since 1870, died at his home there on March 31. Mr. Jack, who was 73 years old, was President of the American Bottle Company. He was a native of Old Chester, Penn. When 19 years old he went to Philadelphia to learn the car building trade. In 1870 he located in Streator, where he entered the store of Overholt & Holmes until he was called to assume the management and direction of the great glass interests which were then being developed.

Mr. Jack acquired a good business education and by study and close application, fitted himself for his work. He also studied law and was admitted to the bar, but never practiced. In 1881 a group of business men started what was then known as the Streator Bottle & Glass Company. This was the beginning of what is now the American Bottle Company. Mr. Jack was appointed Superintendent of the factory at the beginning, although not at all familiar with the glass industry. By his perseverance, resourcefulness and courage in attacking problems, the plant expanded rapidly and when it consolidated in 1906 with the Owen Bottle Company, became one of the most important factories in the West.

esuscitating the "Apparently Dead"

Artificial Respiration Saves Many Lives If Properly Administered in Time—Directions for "Prone" Method

THERE is one very common hazard, among others, which is found in most industrial plants—the risk of severe electric shock, because the ma- y of manufacturing concerns use elec- ty for power.

is true that "safety switches" are in- ed in many shops; and yet, even in , there are still cases of electrocution, consequently loss of life.

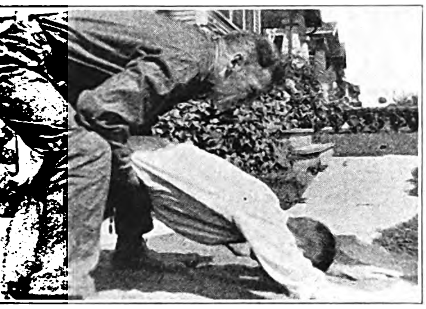

Fig. I

hen, too, there is the constant risk of hyxiation in numerous industries from nes and gases, especially monoxide ; as, for instance, the exhaust of gasoline gines, which is actually the cause of ndreds of deaths annually.

urther, few realize that a severe body w, as from a fall, or some hard object ing one violently in the chest, may knock nan out to the extent of stopping his athing and thereby making the victim all appearances—dead!

But, in reality, he is only "apparently ad!" That is, he is in a condition of pended animation; he needs first aid in form of artificial respiration. But if does not get it, he will have to be buried ong with the thousands who are thus ried every year! Why? Because he s beyond hope? Oh, no; but because few know how to render this life-reviv- service!

I have not mentioned drowning, chok- , burial by cave-in, poisons,—such as danum, etc. But, suffice it to say, any cident which causes a man to stop breath- , short of a smashed skull, a shot through e heart or brain, etc.,—in a word, the ffering of a fatal accident—is not beyond possibility of revivification, providing is taken in hand at once and given the oper treatment.

This article is particularly written to ex- ain the what, why and how of the con- tion commonly known as "apparently ad," and the best methods of applying suscitation. It is a big subject; conse- ently, the writer is very much limited e to the brevity demanded in a magazine ticle. However, it will be of interest to e reader to know that there is now on the market "A Manual of Artificial Respiration," published by the Stratford Company of Boston. The writer (its author) earnestly urges the purchase of this work, because it deals with the general subject in a manner—reasonably speaking—which is comprehensive, every phase of the matter being treated. It is so plain that "he who runs may read," and only one perusal of the "Manual" is needed to make the reader a life-saver.

By CAPT. G. R. C. FISHER
Inspection and Safety Department,
Illinois Manufacturers' Mutual
Casualty Association, Inc.

As a matter of information, so one may possess an understanding of what he is really doing when he performs artificial respiration, we shall deal with the "What" of the condition referred to as "apparently dead."

What Happens When You're Hit

Whenever one is "hit" by either of the emergencies to which we have referred as the direct causes of this state, here is what actually occurs in the organism or body of the victim:

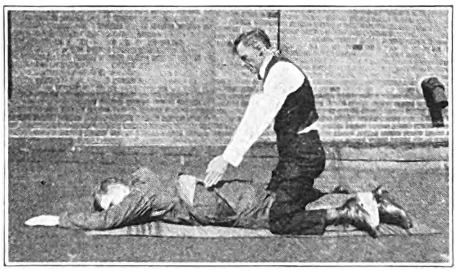

Fig. II

The respiratory center in the brain, which regulates the breathing, becomes temporarily paralyzed, as does also the diaphragm, which is the organ of respiration; then the lungs and the heart. So, in a few moments, the victim is to all appearances really dead. But don't lose sight of the fact that death is only "apparent," not actual, though the victim neither visibly breathes nor does the heart palpitate. That these organs may be made to refunction is a fact borne upon us day by day by those who know how, and who patiently persist through many hours, sometimes, to obtain results. Indeed it is reported that fully seven out of ten resuscitations in the industrial realm are effected, not by doctors, but by workmen, because they get on the job immediately and because doctors are not always at hand.

What is known as the "Schaefer" or "prone" method of resuscitation is simply that of compelling the diaphragm to "carry on" until the respiratory and brain centers are restored, when the heart and then the lungs "come back." This is artificial respiration.

When the operator straddles the body of the victim, he places his hands on the body immediately above the hip-bones, with the finger-tips out of sight and, therefore, over the floating ribs. As he throws the weight of his body onto his rigid arms, bearing downwards, and at the same time squeezing in with his fingers, this is what he actually accomplishes:

The downward-upward pressure upon the palms of his hands, together with the inward pressure of the fingers, forces the organs (the liver, spleen, stomach, etc.,) up against the diaphragm, causing it to rise: this is *expiration.* When he snaps his hands off the body and on to the floor, these organs drop back, the diaphragm descends, there is a loud gasping sound from the victim through the vacuum made by these sudden reactionary movements, followed by an inrush of air; this is inspiration.

There are four steps which *must* be taken before attempting to perform the "Schaefer" method of artificial respiration, as follows:

First, loosen all clothing at the neck, and especially around the waist. This permits the diaphragm to have free play. Therefore, a belt, trouser band, skirt bands and corsets, positively must be loosened.

Second, turn the body face down, grip with interlocked fingers under the waist line, and jerk the body up. If a drowning case, repeat two or three times; likewise for gas, fumes or smoke; this action causes the water to belch out, and frees the air passages—but do it in every case. (See Fig. 1.)

Third, bring the tongue forward, clear the mouth of loose false teeth, food, gum or tobacco: if none of these is present, there is usually froth or mucus.

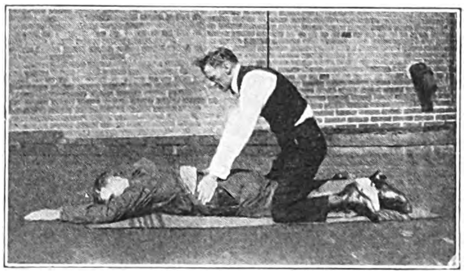

Fig. III

Fourth, stretch the arms above the head, flex one arm with hand towards opposite shoulder lay head on this arm with face outwards.

When these steps are taken, the victim is ready for the reviving movement, but not till then; and if the facts were actually known, it is usually because all these preparatory steps were not taken that resuscitation probably failed. That is, providing the work was attempted within half an hour after the time the accident occurred.

Now for the actual application of the methods of the "Schaefer" movement, and here also there are four steps to be taken which are vital. If there is one phase of first aid above another in which one should remember the Latin adage "to make haste slowly," it is in this particular task of administering artificial respiration.

Don't begin, therefore, until you are ready, because success can only come when the rules are strictly followed. In resuscitation under the "Schaefer" method we imitate respiration artificially and "carry on" until respiration becomes normal physically.

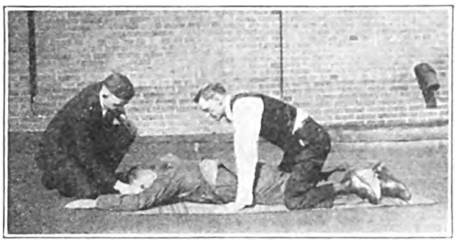

Fig. IV

The Schaefer Movement

First, straddle the body with your knees just above those of the victim, at the same time make your arm rigid, bring the thumbs close to the fingers. (See Fig. 2.)

Second, place the hands on the victim's body above, but close to the hip-bones, finger-tips out of sight; the fingers are thus over the floating ribs. (See Fig. 3.)

Third, throw weight of your body on your rigid arms, and as you bear down press in with the fingers. This movement should only last during two slow counts, and effects expiration, or breathing out.

Fourth, as you count two, snap the hands off the victim to the ground; continue to count three, four, five, and resume as above. (See Fig. 4.)

(Note—the hands must not slide off, but be snapped off, because, as explained, it is the reactionary backward movement of the organs and diaphragm that produce the inrush of air, or inspiration.)

As an aid in performing the movement successfully, follow these hints: Have an assistant kneeling at the victim's head, holding a cloth on which aromatic spirits of ammonia has been sprinkled, and as the operator's hands are snapped off the body, place the cloth for a moment near the mouth and nostrils so that the inrushing air may be mingled with the stimulant.

If cold, a blanket may be placed over the body, also hot water bottles may be placed at the feet and close to arm-pits; but take care not to burn the victim.

In a case of severe electric shock, in which the victim did not fall over six feet: Have the helper kneel close by with a stout stick, and at intervals of say, one minute apart, lift each foot alternately clear of the ground and hit twice between heel and sole. This is what is known as "counter shock," and has the remarkable effect of quickening the reaction of the paralyzed nerve centers because there is an intimate relationship—so to speak—between the soles of the foot and the nervous system. (See Fig. 5.) The nervous agitation caused by the tickling of the feet is a proof of this fact; how much more, then, must there be by this method of nerve excitement!

"Don'ts" to Remember

In conclusion, permit me to suggest a few "don'ts" to bear in mind:

Don't wait under any circumstances in starting artificial respiration; time is a tremendous factor.

Don't stop the use of the "Schaefer" method to allow a mechanical apparatus to be used; nothing excels the manual method; if it doesn't succeed, no machine can, so hang on.

Don't surrender the body to an ambulance, unless the movement can be carried on en route; the *Traveler's Magazine* recently told of a Boy Scout working on the body of his father; the ambulance doctor told him to stop, but the boy pleaded to accompany the body; he did so, kept on working, and brought his father to before they reached the hospital!

Don't rub the limbs until the victim shows signs of reviving unless he is an illuminating gas victim.

Don't be too eager to give liquid stimulants upon reviving; give him time to get his breath.

Don't fail to watch him for hours after resuscitation: he may stop breathing again; if so repeat the movement.

Industrial Accidents Up 20%; 3,000,000 Is Estimate

A 20 per cent increase in industrial accidents in the United States in 1923 is estimated by the National Safety Council from statistics collected from states, insurance agencies and industrial concerns. Industrial accidents reported by only nine states—Illinois, Indiana, Wisconsin, Massachusetts, New Jersey, Delaware, Washington Oregon and Pennsylvania—totaled more than 500,000, an increase of approximately 100,000 over the previous period, with 4,112 fatal accidents in the periods reported in eight of the states, as against 3,726 for the year preceding.

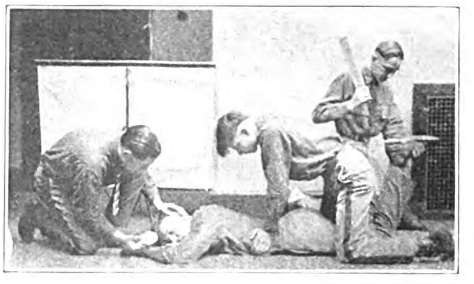

Fig. V

The total for the year is estimated at 3,000,000 accidents of which 23,000 were fatal and 115,000 caused permanent disability. The total cost is estimated at more than $1,000,000,000. Increased production, many new employes and a let down in safety interest by both employes and employers are held as factors in the 1923 experience. In the face of the general increase many steel plants, public utilities, mines, railroads, automobile and general manufacturing concerns made excellent safety records last year.

Suez Canal Will Deepen Its Channel to 36 Feet by 1925

The Board of Governors of the Suez Canal Company is improving that waterway to the point where its facilities will rival, if not surpass, those of the Panama Canal, so far as navigable depth is concerned, and also to accommodate the large vessels which are using the channel in greater numbers each year, says *Marine News.* While the huge passenger liners now plying on the North Atlantic are not likely to use the canal, work now under way will make possible the passage of all except eight of these vessels.

The eight vessels unable to pass the waterway are the "Mauretania," "Paris," "Homeric," "Aquitania," "Olympic," "Berengaria," "Leviathan" and "Majestic." The work now under way will be completed by 1925 and will make the channel available for ships of 36 feet draft, which is equivalent to 37 feet in the fresh water of the Panama Canal. The latter has a depth of 40 feet.

When the Suez Canal was built in 1859 the draft was 24 feet 7 inches. This has been increased steadily to accommodate larger vessels. The average size of ships using the waterway has advanced at the rate of about 100 tons a year. The number of vessels of large tonnage passing the Suez is still limited, but is mounting gradually. In 1922 there were twenty-nine vessels of more than 29 feet draft, and 113 of 28 feet. The work now under way will shortly allow an authorized draft of 33 feet, to be increased later to 35 feet and then 36 feet. It is expected this will take care of the largest steamships which will use the canal for several years.

In making these improvements, it is pointed out, the Suez Canal Company is looking forward not only to the accommodation of vessels in the ordinary trade between the East and the West, but also to the competition offered by the Panama Canal on trade routes which can be served by either waterway.

Michigan's Manufacturers Hold Annual Meet Apr. 16

John E. Edgerton, President of the National Association of Manufacturers, Chairman of the National Industrial Council and President of the Lebanon Woolen Mills, and David Friday, Director of Research of the National Transportation Institute and former President of the Michigan Agricultural College, will be the principal speakers at the annual meeting of the Michigan Manufacturers' Association, to be held in Detroit on April 16. It is expected that the full membership of the Association, 1,400 firms, will be represented at this meeting.

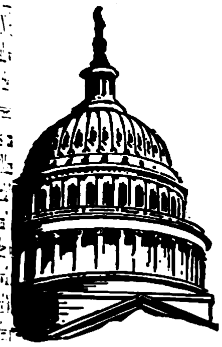
H. J. Mallery of the Buick Motor Company, Flint, Mich., is scheduled to be elected President of the Association to succeed C. E. Bement. Mr. Mallery is now a Vice-President.

Daylight Saving April 27

Daylight saving in Chicago will begin at 2 A. M. on Sunday, April 27, according to the City Ordinance. Clocks will be turned ahead one hour. Most railroads entering the city will operate their suburban schedules on the Daylight Saving Time, but all other service on Standard Time.

Congress Turns to Legislative Acts

Daugherty's Departure Cripples Partisan Investigation; Heavy Program Is Ahead Before National Conventions



By JOHN M. TOWNSEND

Washington Correspondent, Manufacturers News

Washington, D. C., Apr. 9.—Two calendars aroused more interest in Washington this week than any of the revelations of Senate Investigating Committees, with the result that Sen- leaders have practically abandoned ir carefully prepared plan of campaign inst members of the Coolidge Cabinet, l instead have decided to devote their jor attention to the enactment of legis- ion. The first of these calendars is that ich reveals the date of the National litical conventions to be only a little re than two months hence; other is the calendar of islation in Congress itself, ich shows much to be ac- nplished in that time. Taken gether, they admittedly have bearing upon the presiden- l campaign far beyond the hievements of investigating dies, and as a consequence e leaders have at last set out the formulation of a gislative record for their re- ective parties, fearful lest overplaying of the inquis- or's role would have a detri- ental effect upon the elec- rate.

THE SENATE SITUA- ION—The retirement of arry M. Daugherty from the ttorney-Generalship has left e Senate Investigating Com- ittee practically stranded, id shifted the center of in- rest in Congress to such a de- ree that, despite valiant efforts of the vestigators to unearth a sensation a day, eir activities receive a gradually dim- ishing attention from both Congress and e people themselves. While it will prob- bly be several weeks before these investi- ations finally "run down" through lack f motive power, Senate leaders felt it ould be increasingly difficult to rivet na- onal interest upon their revelations, and r this reason the drives against Secretary f the Treasury Mellon and other Cabinet fficials were quietly abandoned. Origin- lly heralded by a blast of partisan ora- ry, the McKellar resolution, aimed at ecretary Mellon, was subsequently per- itted to die without effort on the part of s supporters, and Democrats and Repub- icans joined in an attempt to resume ordi- ary legislative activity, not, however, un- inged with political speechmaking, still ne of the major products of Congress.

PRESIDENT TAKES HAND—The decision of the Senate to again become a legislative body was not brought about, however, without the intervention of President Coolidge. Throughout the long weeks of attack, the President maintained a calm silence until the resignation of Mr. Daugherty seemingly removed the bone of contention. Having accomplished this step, the Chief Executive lost no time in summoning Senate leaders to the White House and informing them that, in his opinion, the time had come to speed up legislation in both houses of Congress. The effectiveness of Mr. Coolidge's argument is best judged by the fact that almost immediately the abandonment of the warfare against Cabinet members was announced on the floor by both Republicans and Democrats.

U. S. ATTORNEY GENERAL HOOKS A PRIZE

Harlan Fiske Stone, New Member of President's Cabinet, Casting for Brook Trout at Long Island Country Club—He Caught the Grand Prize Winner, a 36-Ounce Fish

IMPORTANT MEASURES PENDING—The ability of Congress to enact legislation in quick time when compelled to do so has been demonstrated many times. All-night sessions, cloture rules, speeding of roll calls—all are expedients which are frequently adopted when a session is drawing to a close. Unfortunately, hasty enactment often means hasty consideration, and with this idea in mind the President has determined to urge a legislative program upon the Congress which, while conserving time, will likewise result in wise statutes. Of paramount consideration, of course, are the appropriation measures, providing for the expenditure of money necessary to carry on the activities of government. These are to be given right of way in both House and Senate, until the needs of the Government for the next fiscal year are taken care of. Faced by the expiration of present laws, the immigration situation needs attention, and measures are before both houses on this subject at the present time, with prospects of passage by the end of another week. Soldier Bonus legislation, and the Tax Revision measure, having passed the House, are now pending in the Senate Finance Committee, where day and night sessions are in progress with a view to a speedy report to the Senate itself. Agricultural relief legislation is another matter which the President is anxious to have cleared out of the way by the time adjournment date arrives, and Congressional committees are pressing for a conclusion on these measures. Involving broad questions of policy, each of these measures contains, excellent opportunity for debate which will not be overlooked by either Republicans or Democrats, and it is universally recognized that it will be a tight squeeze to get all the requisite legislation finished in the allotted time. Both the President and the Congressional leaders, however, are committed to the proposition of an adjournment before the conventions, and the speeding-up process which will leave little room for anything except bona fide legislative action is the present order of the day.

COOLIDGE AGAINST NEW TAXES—The action of the Senate Finance Committee in proposing a tax on radio receiving sets, recently brought from President Coolidge a reiteration of his general policy on taxation which, it was explained, is opposed to the imposition of any new levies upon the taxpayers. Believing that the Government should be conducted so economically as to render additional tax burdens unnecessary by keeping expenditures well within the revenues received, the President told callers that unless the new radio tax was, in effect, merely a shifting of tax burdens from one place to another, he would not be inclined to favor the proposal. Equalization of the tax burden by changes in the Senate Bill might prove acceptable to the Chief Executive, but, it was explained, there is no faltering in his decision that the present burden of taxation should not be increased through the enactment of any such proposal by Congress.

THE NEW ATTORNEY GENERAL—With the selection of Harlan Fiske Stone, former Dean of Columbia University Law School, President Coolidge chose as Attorney General to succeed Harry M. Daugherty a man whom he believes fulfills the requirements he imposed, which called for an able administrator as well as a well-equipped legal authority. Incidentally, the circumstances surrounding the acceptance of Mr. Stone gave an interesting sidelight into the Coolidge method of transacting public business. Back in the days of Rooseveltian energy, it was the custom for the President to invite guests to breakfast to thrash out perplexing problems. That plan had fallen into such disuse as to be almost a forgotten custom until recently Calvin Coolidge held a breakfast table conference, at which his new Attorney General was offered, and accepted, his post. Since that time, several of the Senate leaders have been jostled out of their customary easy-going routine by a summons to the White House for breakfast. Confined to his desk throughout the day, President Coolidge found that the breakfast hour afforded the best opportunity for an uninterrupted conference, with the result that the morning meal at the White House has again taken on increasing significance.

SETTING THE POLITICAL STAGE—Above all the activities in the National Capital can be heard the deep rumblings of the various varieties of political "stage hands" as they go about their business of preparing for the grand performance scheduled for a week's showing in Cleveland and New York next June. In the Republican "green room," the Coolidge adherents sit calmly confident of the success of their star; William M. Butler, Campaign Manager for the President, predicts that already the nomination of Mr. Coolidge is assured by the fact that on April 22, his candidate will have pledged to him more than 620 delegates to the Republican Convention. The rosy prospects for nomination received a setback, so far as election is concerned, however, by the visit of Governor Preus, of Minnesota, to the White House, where he asserted that a third party, under the leadership of Senator Robert M. LaFollette, would secure a majority of votes in six states normally Republican in character, and might bring about the defeat of the President. The third party movement would be successful in Wisconsin, Minnesota, North and South Dakota, Montana, and Colorado, and perhaps in Nebraska, Idaho and Iowa, the Minnesota Governor warned. Activities in the Democratic wings continues to be centered chiefly around the selection of a suitable star. William G. McAdoo continues to snare delegates in various state primaries, and the candidacy of John W. Davis is the subject of much favorable comment, despite his issuance a few days ago of a letter expressing preference for his legal career rather than the chief executive's post.

Heidrich and Hastings Talk to Quincy Manufacturers

President E. C. Heidrich, Jr., of the Illinois Manufacturers' Association, was one of the speakers on April 2 at a luncheon at the Quincy Hotel, Quincy. Sixty of the leading manufacturers of that important industrial city were present. The luncheon was given by Edward N. Monroe of the Monroe Drug Company, one of the Directors of the Association.

Mr. Heidrich told of the work the Association is doing in the interest of industry and business in Illinois.

Samuel M. Hastings, a former President of the Association and now President of the Illinois Manufacturers' Mutual Casualty Association, Incorporated, described the effective work of that organization in keeping down the cost of casualty insurance and preventing accidents.

Week-end Telegrams to Sweden

The following notice has been issued by the Chicago office of the Western Union Telegraph Company:

Effective March 1, 1924, the week-end service for through telegraphic transmission is extended to Sweden at rate quoted below.

Either the English or Swedish language may be used in the text.

Code addresses are permissible and week-end letter prefix 'Wlt' must be first word in address.

Your Time Is Money

Your freight shipments have often been delayed more between your doors and the freight stations than on the railroad.

Quick and careful freight house trucking is our specialty.

Perhaps the operation of your own trucks runs your trucking costs too high.

We can do your trucking cheaper and quicker than you can — that is our business.

Perhaps your trucking demands come only at certain intervals.

Tell us your requirements and let us submit our estimate for your trucking.

Perhaps your neighborhood can support a regular trucking service.

Let us study your needs and submit a schedule to care for your neighborhood trucking.

Perhaps you require fast and safe suburban and interurban service.

Our despatcher can give you a schedule as exact as a railroad time card.

We have 75 trucks from 1 to 7 tons capacity in perfect running order day and night.

Let us help you save your money.

)elegating Industrial Responsibility[*]

Efficient Management Depends on Capable Personnel and Departmental Executives—Sales Cover All Costs

By G. M. PELTON
Comptroller's Department,
Swift & Company

I

IT is generally recognized that one of the fundamental problems in all business and industrial organizations is to determine how the management
y use capital so it will produce proper
: returns on the money invested. In
ıer words, how should a business be
ganized and conducted so the stockhold-
, or proprietors, will realize satisfactory
urns on their invested
pital?

It is apparent that the
lution of this problem
largely dependent on
oper organization and
icient management, and
at efficient management
obtained principally
rough capable person-
l, together with the delegation of functional re-
ıonsibilities to department heads and executives
charge of the various
visions of a business.
his indicates the need for
ore departmentalization
business and industry,
it may be possible to
itisfactorily delegate all
ınctional responsibilites
-those of a financial, op-
ating and merchandis-
ıg nature—to heads of
epartments or divisions
f a business, particularly
heads of merchandising
nd operating depart-
ıents.

Now, irrespective of the
ype of organization,
roducts handled, kind of
usiness done, or cost
ıethods used, it is funda-
ıental that the manage-
ıent of industrial con-
erns consists of three
eneral functions:

1. Financing—the securing of necessary funds with which to conduct business.
2. Merchandising, or the buying of raw materials and the selling of finished products.
3. Operating—the manufacturing and distribution of finished products.

In other words, in most manufacturing
ırganizations there is a need for proper
lepartmentalization for the purpose of se-
uring the satisfactory delegation of finan-
ial, merchandising and operating responsi-
ilities.

Of course, making a profit in any busi-
ıess or industry would be simple:

1. If the costs of raw materials, selling prices of the finished product and merchandising expenses could be definitely determined by the management.
2. If operating costs could be fully controlled.
3. If financial costs could be fully regulated.

But such a condition does not and cannot exist in competitive lines of business and industry, because the factors just referred to are largely governed by the laws of supply and demand and the forces of competition. All businesses are dependent, in final analysis, on the wants of the ultimate consumers and their ability to pay for values received. Naturally their wants, desires and ability to make purchases change from day to day, thereby creating changes in prices, which are expressions of the values which consumers put on goods and services.

Training Program for Factory Foreman

EVERY successful manufacturer knows his reliance upon the efficiency of the foremen in his plant. Every foreman knows he is a "key man" in industry. Both manufacturer and foreman realize the importance of co-operation.

Beginning in the issue of May 3, MANUFACTURERS NEWS will publish a series of twelve articles on

A TRAINING PROGRAM FOR THE FACTORY FOREMAN
By J. K. Novins

These articles are authoritative. Mr. Novins has, for the past four years, devoted all his time to investigating industrial problems. He has done special work in economics at Columbia University and is a graduate of the New York School of Commerce, Accounts and Finance, with the degree of Bachelor of Commercial Science. He is a former newspaper man, has written extensively for the trade and industrial press, and is the author of a book on manufacturing operations.

Mr. Novins is now engaged in making a comprehensive study of the foreman training activities of the Pennsylvania Railroad System.

The subjects dealt with in this series are every day problems, handled in a practical manner, which, followed step by step, will show the executive the path to increased production and an improved management of men and machinery.

DON'T MISS THIS SPLENDID SERIES OF ARTICLES

From an economic standpoint, four classes of persons are directly interested in any business or industry:

1. The producer of raw materials.
2. The consumer.
3. The employe or wage earner.
4. The investor and creditor who supply the required capital.

Sales Price Must Cover All

The relationships between these classes of persons are expressed in prices, wages and profits. The difference between the prices paid for raw materials and the prices realized in the sale of finished products represents the gross margin of profit or loss. This profit should be sufficient to cover operating wages and all expenses incurred in plant operations, selling and administrative expenses, financial costs and expenses including interest on borrowed funds, dividends to stockholders, Federal taxes, etc., and leave a final net balance to be carried to surplus for working capital and expanding needs of the business. Naturally, if a business is to operate successfully for any considerable period of time, it is clear that the spread between its costs and sales must be sufficient to cover all of these operating, merchandising and financial expenses and provide a fair profit on its invested capital. And this must be accomplished in spite of the fact that keen competition usually exists in every phase of business, such as buying, selling, operating and financing.

Of course, it is desirable in all concerns to have merchandising executives who exercise general supervision over the combined buying and selling operations. The buying and selling must be tied up and controlled from a broad and final point of view.

The buying organization should be guided by costs which will tell them what they can afford to pay for materials and supplies. The selling department heads should be informed of their actual and total costs and results, so they may intelligently meet competition and properly handle their business. Operating is also a distinct function of the business, and heads or foremen of these departments, should be regularly supplied with adequate cost information.

In other words, in many industrial organizations, departmentalization is necessary because of the large variety of operations, the kinds of products handled, the various bases on which expenses should be distributed, and the cost problems encountered. Where an organization handles several lines of products, and may even engage in entirely distinct and competitive industries, it is essential that its accounting procedure, cost finding and departmentalization should recognize the requirements of each line of business, and that each department should be accounted for on its own basis in the manner best fitted its operations and transactions.

---

[*] First of two installments of recent address
·fore Illinois Manufacturers' Costs Associa-
ion.)

This is clearly evidenced in our own industry in which there is highly specialized departmentalization, and in which all three of the fundamental types of cost finding methods, are used, i. e.:

Ordinary, such as job or process cost, wherein to a known amount of material is added a definite amount of labor and expenses, the sum total of which is the total cost.

Major and by-product cost, which involves the taking apart or breaking down of some materials of known value into several or many parts, of which one is the major product and the others by-products. This is the method of figuring cattle costs in the packing industry, the same method applying to production in other industries, such as petroleum, farm products, etc.

Joint product cost, pertaining to operations which are the breaking up of something of known cost into several or many parts, none of which may be termed the major product. This method of cost finding is used in tobacco, glue, cottonseed oil, the hog business in the packing industry, etc.

To further illustrate the necessity for departmentalization and the different types of cost finding in our industry and business, we find that some plants handle only a cattle, calf and sheep business. Others may do only a hog business. Some will handle all classes of live stock. Some plants do not process by-products to any extent, but dispose of them raw, or in lesser stages of manufacture, while others process their products to various degrees. Some plants do not engage in allied industries, while others may have extensive operations in separate competitive businesses, such as fertilizer, glue, soap, etc.

Method of Managing

The method of managing the business in each case, and the accounting therefor, requires careful and logical departmentalization, appropriate to the particular plant and its activities. Each department, or activity, meets the competition of other firms engaged in that particular line of business. In reality, each department is a separate business using its own capital, handling its own products, incurring its own expenses and being held responsible for its own final results, in competition with similar businesses. It is necessary therefore, that each of these separate departments, or competitive businesses, be handled, operated and fully and finally accounted for on its own independent commercial basis.

Operating departments as separate business units and accounting for them as such, requires that each carry its own investment in inventories, plant and equipment, etc.; that each should be charged for its materials at full cost, or value, if received by transfer from other departments; and be charged with all factory and general costs and expenses; and, on the other hand, that each department should receive credit for its sales, or transfers of product to other departments, at full sales or market value. Naturally, it is clear then that the departmental statement of each department is a combined financial, merchandising and operating report of the department.

In any industry in which this situation prevails, two parties are directly and vitally interested in these statements and the figures they contain—the operating man, who is directly in charge of the plant department, and the selling department head, who is directly responsible for the merchandising transactions. Indirectly the plant manager, superintendent, buyers, financial and other general executives are interested in these figures. It should be recognized, however, that we are now looking at this question from a combined functional and departmental standpoint, and assume that general executives will be fully supplied with statistics and information.

Let us now consider the cost information which should be submitted to these three classes of department heads:

1. Costs for use of those who handle buying.
2. Costs for plant operating department heads.
3. Costs for selling department heads.

To get the best results from a buying standpoint, it is necessary to supply the buying organization promptly and regularly with cost information indicating what the selling prices of finished products will permit of paying for raw materials. The prices at which goods will sell necessarily limit the prices which can be paid for materials and ingredient supplies.

In some businesses, it is possible to figure up the cost of a product, and from that cost to determine a selling price. That is commonly thought of as the purpose of cost accounting—to establish the basis for determining selling prices. It is a fallacious notion as applied to most competitive manufacturing businesses, for the reason that the real function of cost and the real service performed is in the determination of the maximum which can be paid for materials, rather than what may be charged for the finished products. To think that in the average industry the cost determines the selling price is cocking one's economic hat on the wrong ear. It works just the other end to. The whole question lies in the satisfaction of human desires—the determination of what people want, when they want it, where they want it, and how they want it, which are generally recognized as the utilities of time, place and form.

In order to continue doing business for any considerable length of time it is necessary to meet these requirements. That is, supply has to be adjusted to demand, not demand adjusted to supply. The problem is, what are the finished products selling for and what is the maximum price that may be paid for the raw materials? In other words, if a business is to operate successfully, it is clear that the spread between its raw material costs and the sales prices of finished products must be sufficient to cover all operating, merchandising, and financial expenses, and provide a fair profit on its invested capital.

And, as already explained, this must be accomplished in spite of the fact that keen competition usually exists in every phase of business, such as buying, selling, operating and financing.

(To be continued)

1,500 Are Ready for C.M.T.C. at Camp Custer in August

Maj. Gen. Harry C. Hale, Commanding General of the Sixth Corps Area, has just announced that Brig. Gen. George Van Horn Moseley will again command the Summer training camp at Camp Custer, Michigan, during the coming Summer.

Camp Custer will be opened as a training camp on May 1, when regular troops from various stations throughout the Corps Area will proceed to camp to get everything ready for the Reserve Officers Training Camp, National Guard, Reserve Officers' and Citizens' Military Training Camps, which will train at Camp Custer during June, July and August.

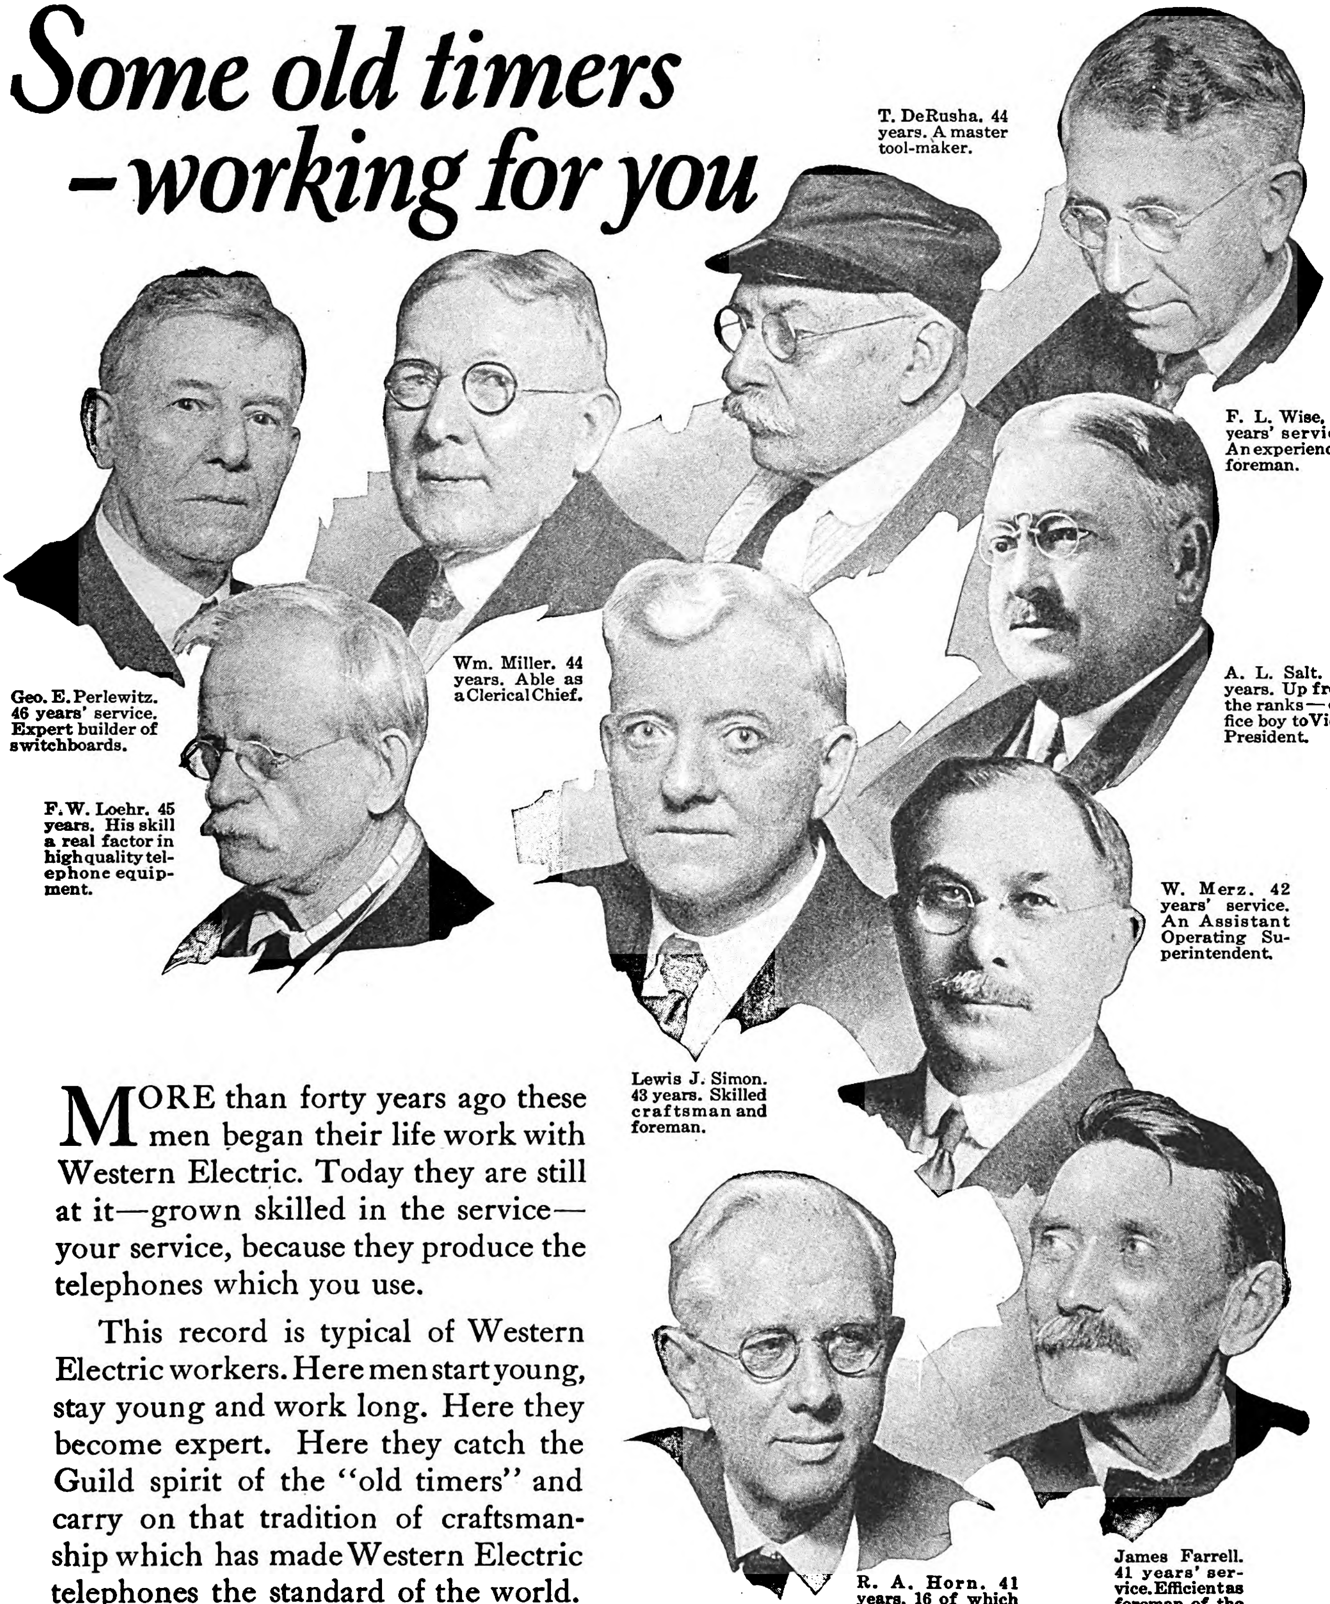
Col. W. T. Merry, Infantry, D. O. L., who will command the C. M. T. C., is at present Professor of Military Science and Tactics at the University of Illinois, where there are over 3,000 university students under his instruction in the Reserve Officers' Training Corps.

The Citizens' Military Training Camp will be the largest unit to train at Camp Custer, and is expected to have 3,900 young men from Illinois, Michigan and Wisconsin in attendance during August. Attendance is voluntary on the part of the young men attending but it is necessary to make formal application to be permitted to attend. Over 1,500 applications have already been received at Sixth Corps Area Headquarters, and at the rate they are now arriving it is expected the entire quota for the Area will be filled by May 1, so that any boy between 17 and 24 years of age who is considering attending the C. M. T. Camp should get his application in at once to insure acceptance.

Trade Tests for Farmers

Farm labor conditions could be improved by the use of trade tests to determine the fitness of applicants for particular jobs, by wage-rates allowing for differences in skill and efficiency, by provision of steadier work through greater diversification of crop and livestock policies, and by higher standards of housing for farm workers, say economists of the U. S. Department of Agriculture who recently studied truck farm labor in New Jersey. Adoption of these and other methods of attracting and holding a better class of help would show cash returns, and at the same time would promote a more cordial relationship between farmers and their employes, it is said.

Some old timers – working for you



T. DeRusha. 44 years. A master tool-maker.

F. L. Wise. 43 years' service. An experienced foreman.

Geo. E. Perlewitz. 46 years' service. Expert builder of switchboards.

Wm. Miller. 44 years. Able as a Clerical Chief.

A. L. Salt. 43 years. Up from the ranks—office boy to Vice-President.

F. W. Loehr. 45 years. His skill a real factor in high quality telephone equipment.

W. Merz. 42 years' service. An Assistant Operating Superintendent.

Lewis J. Simon. 43 years. Skilled craftsman and foreman.

R. A. Horn. 41 years, 16 of which he has been General Foreman of the insulating division.

James Farrell. 41 years' service. Efficient as foreman of the battery room.

MORE than forty years ago these men began their life work with Western Electric. Today they are still at it—grown skilled in the service—your service, because they produce the telephones which you use.

This record is typical of Western Electric workers. Here men start young, stay young and work long. Here they become expert. Here they catch the Guild spirit of the "old timers" and carry on that tradition of craftsmanship which has made Western Electric telephones the standard of the world.

Western Electric

SINCE 1869 MAKERS OF ELECTRICAL EQUIPMENT

TRANSPORTATION

U. S. May Collect $36,000,000 from Eight Railroads of Country As One-Half Their Excess Earnings in 1923

RAILROADS of the United States may be called upon to pay to the Interstate Commerce Commission approximately $36,000,000 on account of excess earnings in 1923, according to a rough estimate recently made by members of the Commission. On the basis of the estimate, these roads earned not less than $72,000,000 above the "fair" return provided by the Commission.

Under the Transportation Act, the principle was set up that the railroads, as a group, are entitled to a reasonable return upon a fair valuation of their property. Such a valuation was to be made by the Interstate Commerce Commission, and the Commission has set a preliminary figure, based upon the replacement cost of the roads in 1914, and has set 5¾ per cent as a "fair and reasonable" return on such valuation.

The Transportation Act further provides, and the Supreme Court has sustained that part of the Act, that carriers are required to pay to the Interstate Commerce Commission one-half of the net railroad operating income in excess of the "fair and reasonable" rate provided by the Commission. This money, according to the Act, goes into a general railroad contingent fund from which the Commission may loan, at 6 per cent interest, money to aid the railroads in obtaining equipment.

Eight railroads, according to the preliminary estimate, are believed to be subject to the excess earnings, or "recapture," clause of the Transportation Act.

Recently a test case was taken to the Supreme Court by one of the railroads, in a contest of this clause in the Transportation Act, but it was upheld. A number of the larger carriers of the country are now preparing another test case on the same clause, but from a different angle, which it is intended to carry to the Supreme Court for final adjudication.

PROPOSAL

1. **PURSUANT TO THE REGULATIONS** of the Interstate Commerce Commission, prescribed in its **ORDER** dated October 6th, 1919, in Docket Ex Parte No. 54, The Michigan Central Railroad Company hereby requests bids and hereby gives notice that it will receive bids for its requirements until June 30th, 1924, of the following: Sheets, black, galvanized and blue annealed; steel bars, shapes and plates, including fire box and boiler; spring steel; nails, steel wire; steel billets; axles, car and tender truck, axles for axle light system, driving and trailer truck, engine truck; crank pins and piston rods; to be delivered from time to time as desired by said Railroad Company, at points shown on and in accordance with specifications hereinafter prescribed.
2. Bids must be submitted and addressed to the undersigned at his office by 12:00 o'clock noon, Eastern Standard Time, Friday, April 18th. Bids received after that time will not be considered.
3. Bids must be prepared and submitted on the forms prescribed in the regulations mentioned above, which forms will be furnished on request by the undersigned. Bidders may bid on individual items if desired.
4. Bids will be opened in public at 2:30 P. M. o'clock Eastern Standard Time, April 18th, 1924.
5. The successful bidder will be required to enter into and execute proposed Contract No. 2, series 1924, for the delivery of such material.
6. The right is reserved to reject any and all bids and to accept any part of any one bid.
7. Complete specifications now on file in the office of the undersigned, and said specifications can be inspected and examined free of charge during business hours of any business day by any persons who may desire or propose to submit bids and upon request of any such persons copies of said specifications will be furnished and forwarded to them.

THE MICHIGAN CENTRAL RAILROAD COMPANY

B. A. Aikens, Purchasing Agent

Michigan Central Terminal
Detroit, Michigan

Dated, March 31st, 1924 (Advertisement)

Use of Freight Cars

Only 90 per cent of the capacity of the average freight car is being put to economic use under present practice, W. J. L. Banham, Chairman of the Atlantic States Regional Advisory Board, stated recently in a discussion of the railroad situation. Mr. Banham added that the greatest revolution in transportation history is now taking place, through the complete utilization of railroad facilities by co-operation between the buyers and the sellers of transportation, the shippers and the railroads.

The carriers at the present time have more than enough equipment to handle all the business that may be developed by shippers during the next few years, according to Mr. Banham, but present methods of using it are wasteful. Only during 10 per cent of the life of a car, he says, is it actually transporting revenue freight, while the rest of the time it is standing still.

New Industries on C. & N. W.

During 1923 there were 669 new industry locations arranged for with the Chicago & North Western Railroad in providing direct track service as a part in the operation of these business establishments. The construction of private tracks was required by 268 of these new industries to facilitate the handling of their traffic. In addition to this, many new commercial concerns have located at points on this railway system who have adapted their transportation needs to the current facilities, but do not require special action for track or lease of railroad property. These industries are located at points over the several railway operating divisions in the nine states in which The North Western Line is located.

Going to Mexico? Ask C. R. I. & P.

The Chicago, Rock Island & Pacific Railroad has recently issued an attractive booklet descriptive of travel in Mexico, the author of which lived in Mexico for several years and touches on present day conditions with authority. The booklet calls attention to the fact that travel in Mexico has been, for some time past, entirely safe, comfortable and convenient; the train service is excellent, and good hotels are found in all important cities. English-speaking representatives are located in many places, and everything possible for the convenience and welfare of the tourist is done by the Mexican Railway administration. Mexico, the booklet says, uses Mountain time and—this will interest you—runs the hours from 1 to 24 instead of 1 to 12, as is the custom in the United States; midnight is 24 o'clock and 1 P.M. is 13 o'clock, and so on. Copies of the booklet may be obtained upon application to L. M. Allen, Vice-President and Passenger Traffic Manager of the Rock Island Lines, at its Chicago offices, LaSalle Street Station.

Table Linen for a Railroad

Table linen enough to accommodate 60,000 guests is part of the vast stock of imported linen used in the famous dining cars of the Northern Pacific Railway, according to A. W. Thomson, Superintendent of dining cars. The entire stock comprises approximately 135,000 pieces, valued at $140,000. Northern Pacific dining cars use 13,000 glass towels, 9,000 dish towels, 19,000 hand towels, 300 bath towels, 10,000 large table cloths, 10,000 small table cloths, 800 table pads, 5,500 dozen napkins; and, for the beds of dining car crews, 200 dozen sheets and 200 dozen pillow slips. There is also a $4,000 stock of coats, aprons and caps for cooks and waiters. Nearly a million persons annually breakfast, lunch and dine aboard the Northern Pacific, and spotless, high-grade table linen adds to the enjoyment of their meals.

New C. G. W. Traffic Manager

Oscar Townsend has been appointed Traffic Manager, in charge of freight and passenger traffic of the Chicago Great Western Railroad, according to an announcement by S. M. Felton of that road.

dustry Halts, Awaiting Tax Action; Mellon Plan Urged on Senate by I. M. A.

EGINNING of a slackening in business as a result of failure of the U. S. Sen- o give consideration to the Mellon Tax ision Plan was pointed out in messages recently by the Illinois Manufacturers' ociation to President Coolidge and Sen- Medill McCormick. The appeal for mpt consideration of the Mellon Tax n without any further tinkering fol- ed a meeting of the Federal Tax Com- ee of the Illinois Manufacturers' As- ation, Samuel M. Hastings, Chairman, the Illinois Industrial Council, consist- of representatives from leading indus- l centers of the state. The message to sident Coolidge said:

Manufacturers of Illinois feel that the begin- g of slackening business is largely due to the ertainty and feeling that the Senate is not ng favorable consideration to the Mellon Tax ision Plan. We entirely approve your course endeavoring to secure prompt action. If you make any suggestion which we might further ist in the bringing about of this important slation, we will be happy if you would com- nd us. We feel certain that Illinois and other ddle Western states will give you earnest sup- t."

The message to Senator McCormick fol- vs:

"Industrial interests and business organizations oughout the state generally believe that the nate Finance Committee, appreciating that busi- ss is beginning to slacken, will realize the imperative necessity of adopting the Mellon Tax Plan. We congratulate you on your return to Washington and hope you will act along these lines. We are so earnest about this that we are prepared to send a large delegation to Washington if you can arrange a hearing before the Finance Committee. Please answer. This message is sent as a result of action taken at a joint meeting of Federal Taxation Committee of Illinois Manufacturers' Association and the Illinois Industrial Council."

The meeting of the Taxation Committee was enlivened by a statement from Alexander H. Revell that the loss, through drop in value and business as a result of failure to agree upon the Mellon Tax Plan "can be conservatively estimated at a billion dollars."

"When the Mellon tax program was announced and up to a few weeks ago," Mr. Revell said, "business was in a flourishing condition. The plan offered a genuine relief from a burden of taxation which is all too heavy, and optimism for a continuation of prosperity ran high. There was talk of still further expansion but instead of passing the bill, the politicians must have their innings. First one revision and then another was suggested in committee. There was no token of an immediate passage or of any permanent tax relief proposal, for the Senate and the House have yet to find a ground for compromise.

"Industry, once confident, is faltering. Financial authorities detect a 'note of caution' in present day trade due to Congressional activities. Values have fallen a substantial per cent while business has fallen even more. Cotton and farm products are not spared. New enterprises are being held in abeyance. In manufacturing and other activities the recovery from the usual Winter unemployment is being delayed.

"The loss, through the drop in values and business, can be conservatively estimated at a billion dollars. Many would say more. Congressional halls seem not to have the slightest idea of the cost of fear and the anxiety which they are creating."

British Coal Production In 1923 Sets New Record

Coal production in Great Britain in 1923 was the greatest on record, with the exception of 1913, according to a report to the Commerce Department. Exports were greater than in any pre-war year.

Production of coal in Great Britain during 1923 was 278,500,600 tons, as compared with 287,430,000 tons in 1913, and represents an increase of almost 28,900,000 tons over 1922. With the exception of 1913 this is the largest annual output ever reached by the British coal mining industry.

Exports for 1923 were not only over 15,000,000 tons ahead of the total for 1922 but have also surpassed the best performance in any pre-war year.

Ask the Canadian Pacific about Canada
CANADIAN PACIFIC RAILWAY

Bureau of Canadian Information

The Canadian Pacific Railway through its Bureau of Canadian Information will furnish you with the latest reliable information on every phase of industrial and agricultural development in Canada. In the Reference Libraries maintained at Chicago, New York and Montreal are complete data on natural resources, climate, labor, transportation, business openings, etc., in Canada. Additional data is constantly being added.

Development Branch

If you are considering the establishment of your industry in Canada, either to develop Canadian business or export trade, you are invited to consult this Branch. An expert staff is maintained to acquire and investigate information relative to Canadian industrial raw materials. Information as to such raw materials as well as upon any practical problem affecting the establishment of your industry, including markets, competition, labor costs, power, fuel, etc., is available.

No charge or obligation attached to the above service. Business men and organizations are invited to make use of it.

FOREIGN TRADE

Past 10 Years a Decade of Wonders In Our International Trade; Imports $30,500,000,000, Exports $52,000,000,000

SOME of the big changes in our foreign commerce since the beginning of the war are noted by a comparison of the 1923 imports and exports with those 1913, the last full year preceding the . This comparison shows that our ex- ·ts of finished manufactures in 1923 ıled $1,478,000,000 against $780,000,-) in 1913, and that the total exports of 23 were $4,167,000,000 against $2,484,-),000 in 1913. The exports of partly nufactured material, comparing 1923 h 1913, increased 42 per cent in value, w manufacturing material 56 per cent, ɔdstuffs 70 per cent, and finished manu- tures 89½ per cent.

This big increase in the value of manu- tures sent abroad was accompanied by orresponding increase in the importation manufacturing materials. There are ıny manufacturing materials for which e are still entirely dependent on the foreign world, such as india rubber, raw silk, jute, sisal, tropical woods and gums, copra, tin, nitrate and many other less important articles, and the import group "raw material for use in manufacturing" has grown even more rapidly than the export group "manufactures ready for use." The total value of raw manufacturing material imported in 1923 was $1,389,000,000 against $605,000,000 in 1913, an increase of approximately 130 per cent while the increase in finished manufactures exported was about 90 per cent.

We scarcely realize the tremendous growth in our foreign trade in the decade since 1913 until we compare the actual figures with those of the decade immediately preceding the war. The total exports of finished manufactures in the ten calendar years ending with 1923 were in round figures $20,000,000,000 against $5,000,000,000, and manufacturing material $10,- partly manufactured material $7,333,000,000 against $2,666,000,000; foodstuffs nearly $14,000,000,000 against $4,500,000,000, and manufacturing material $10,000,000,000 against less than $6,000,000,000 in the decade ending with 1913.

On the import side manufacturing material brought from abroad was $11,500,000,000 in the decade ending with 1923 against $4,666,000,000 in the pre-war decade; foodstuffs over $8,000,000,000 against $3,250,000,000; manufactures for further use in manufacturing $5,000,000,000 against $2,500,000,000; while finished manufactures were $5,250,000,000 in the decade ending with 1923 against $3,333,000,000 in the pre-war decade.

Many Trade Inquiries

Business men at far inland points, miles from seaboard, are adding to the record-breaking volume of inquiries about foreign markets now reaching the Department of Commerce, according to Dr. Julius Klein, Director of the Bureau of Foreign and Domestic Commerce. From the general vicinity of Chicago and St. Louis 9,300 individual merchants or manufacturers asked the Department of Commerce about export sales openings during February. In the Seattle and San Francisco districts, 5,900 business men asked the Department how they could expand their trade beyond American shores. Twenty-seven hundred inquiries came from New Orleans and thereabout, and 1,000 more from the Atlanta region.

Invest Billions in Latin America

Almost four billion American dollars are invested in Latin America—$610,000,000 in Latin American public securities and $3,150,000,000 in Latin American industries. That means nearly $35 for every man, woman, and child in the United States, without counting almost $2,000,000,000 in trade which affects directly and indirectly a great number of Americans engaged in producing transporting, and marketing merchandise, according to the Department of Commerce.

It has been announced that the Third Annual Exhibition to be held at Dresden in the summer of 1924 will be devoted to textiles. It is probable that this exhibition will be limited principally to the Saxon Textile Industry. It is stated that some of the special features will be an exposition of the economic value of the industry and an outline of its historical and scientific sides.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

BELGIUM—9726, coal; coke.

CANADA—9731, fish—fresh, dried, and salted; 9770, hydrogen peroxide in bottles; naphthaline in balls and cakes; 9765, napkins, towels, toilet paper, and other paper specialties.

CEYLON—9785, pipes—drainage and water; plumbing supplies.

CHINA—9736—flour, Northwestern.

CZECHOSLOVAKIA—9758, ball bearings, large quantities; 9748, woodworking tools.

ECUADOR—9744, flour mill machinery.

ENGLAND—9784, cards—greeting, picture, and novelty; 9737, corn products; flour; feedstuffs; 9778, kid skins—glace, black, and colored; 9737, oat meal; rolled oats; rice; 9787, logging cableway, complete, second-hand, for distance of 8 to 10 miles.

FRANCE—9760, metals—raw and laminated, such as German silver, nickel, copper, and aluminum; 9732, rice in 10 to 20 ton lots.

GERMANY—9720, automobiles; 9714, automobiles and accessories; 9721, automobiles; 9742, Douglas fir and decking plank; 9750, glass-cutting wheels; 9721, motorcycles; 9739, oak lumber and southern yellow pine; 9757, radium salts and radium ores, best quality; 9798, sweatbands for men's felt hats.

IRELAND—9796, candles; cheese; fruits—dried and canned; laundry soap; toilet soap.

ITALY—9762, leather for automobile upholstering; leather cloth for automobile upholstering; 9755, southern yellow pine; steel plates for shipbuilding, angle irons, and rivets; 9722, tires, automobile.

JAPAN—9729, electrical heating appliances and other appliances such as boilers, ovens, cooking apparatus, vacuum cleaners.

LATVIA—9746, horseshoe nail manufacturing machinery; 9788, stationery supplies and writing materials; typewriters; 9783, typewriters and adding machines.

MEXICO—9752, cement-making machinery; 9745, engines, producer gas, using charcoal of about 25 horsepower together with centrifugal pumps for irrigation purposes; 9756, steel rails, 60-pound.

NETHERLANDS—9782, pianos and player pianos, low priced; 9789, skates, 1,000 pairs, ordinary, medium and best quality; 9764, stationery, drawing materials and supplies.

NICARAGUA—9747, ice cream freezer and manufacturing equipment, electrically driven machinery for making soft drinks; machinery for bottling soft drinks.

PORTUGAL—9751, cedar pencil slats; 9780, irrigation plant consisting of a water wheel on a punt; 9751, pencil and penholder manufacturing machinery.

SCOTLAND—9769, paraffin scale.

SOUTH AFRICA—9791, advertising blocks and cuts; 9768, belts, waist; 9753, machinery for wire nail making; 9786, tubes—collapsible, colored in red, white and blue; 9753, wire for making nails.

SPAIN—9743, ice making and refrigeration machinery, small, of absorption type.

SYRIA—9749, paraffin wax for candle making.

TURKEY—9723, agricultural implements, especially light tractors.

URUGUAY—9779, winch and capstans, electric, for shipyards.

VENEZUELA—9793, balloons with decorations; novelties; toys.

SALES MANAGEMENT

Salesman Should Try to Impress Prospect With Importance of Mission—Study "Approach" Very Carefully

By C. T. NOBLE

Sales Manager, Illinois Manufacturers' Mutual Casualty Association, Inc.

SALESMEN should always try to impress the prospect with the importance of his call and his mission, and endeavor to prove to the prospect as early in the interview as possible, that his call means service and benefits to him. If he leaves any data, circulars, or printed literature or pamphlets, he should not simply hand them to the prospect and tell him to read them; it is better to point out the strong features and use a heavy marking pencil and mark them in his presence. Make him feel the weight of importance, of special features.

If a salesman is selling a well known commodity and anticipates many objections, he should study a plan of disarming the prospect before he has time to recite a number of objections. This can sometimes be done by simply asking the prospect what he thinks is the best feature about some particular new idea or article he is selling, but he should be sure to select one that the prospect is not familiar with. Experience and practice of this plan will often enable a salesman to get the interest and create the desire quickly.

Some years ago the writer, while selling National Cash Registers, walked into retail stores, introduced himself to proprietor, adding that he represented the National Cash Register Company. This last remark usually brought forth the reply, "I am not interested in any more cash registers. The one I have suits my needs. It is entirely satisfactory" and many other similar remarks which are all standard objections to a purchase. These replies built up barriers and often made it difficult to arouse interest, much less create desire. The writer learned an easy method of disarming the prospect of all of these objections by quickly following his introduction by adding, "I called to sell you a Cash Register, but I see you have one of our registers" and immediately began to talk service to him and by using a well arranged schedule of statements and questions about trade and transactions I gained from a study of his particular line of business. The writer learned that he could easily establish the existence of leaks and losses in the prospect's business and by subsequently summarizing these leaks and losses it was very easy to arouse a keen interest and desire for something better. This plan also placed the writer in the position of aggressor rather than defender and it lent more dignity to the approach.

The salesman who does not study and prepare his approach is very much like an attorney trying a case without any previous study or preparation, with about the same chances of success.

Many salesmen make the serious mistake of trying to get the order before sufficient desire is manifested by the prospect. The appeal should be based upon instincts which are presumed to exist and the salesman should consentrate on the strongest influence over the prospect, whether it is an appeal to his pride, his pleasure or his profits.

A salesman's reasons for buying may be a prospect's reasons for not buying, and the reasons offered may repel rather than attract. The salesman, therefore, must possess a fine discernment of the prospect's inclinations and keep in mind that it is what the prospect thinks that counts.

Interviews terminate in sales—either the salesman sells the prospect or the prospect sells the salesman—and in many interviews it lies within the salesman's power to determine the way the interview shall end. Salesmen should never adopt a cringing manner nor expect unfavorable results. Some salesmen fail because they lack courage. Avoid the quick closing idea. Evident anxiety on the part of salesmen might make a prospect suspicious. However, it is good practice to try out closing arguments. Sales are not necessarily lost if such attempts fail.

If the prospect shows unwillingness to close, the salesman should revert to the sales talk by using such expressions as, "Another point I failed to mention." Test out the prospect's desire by trying to get a series of "yes" responses. This has the advantage of starting the prospect's mind in the "yes" direction. Try to get favorable decisions on minor points first, in order to determine the prospect's attitude, and follow up by swinging back to the sales talk and again to "yes" responses. In using this plain summarize briefly only the most important points.

Sometimes it is a good idea to reserve a strong closing argument to be used when the prospect is very near the closing point.

Why not a profit—instead of a loss on your rags?

Forty-nine tons of rags saved in a single year was the record made by one big printing plant with its Troy Rags and Waste Reclaiming System.

How many *Tons* of rags ($) a year are you burning each year?

Our equipment will enable you to *re-use your rags* many times—thereby showing you a *profit* where a loss now exists.

Are you burning your rags, simply because they are grimy, dirty, or oil soaked, when we can show you a far better and more profitable disposition of them by our Reclaiming System?

Analysis of Cement Prices Published by 2 Economists

Cement producers insist that they are merely an average group of normal competitive business concerns which have supplied the market with a dependable product at a fair price and with only moderate profits to themselves. Strong in this conviction, a group of Eastern producers asked Dr. Harry Parker Willis and Prof. John R. B. Byers to make a careful analysis of cement prices and the economic processes by which they are determined.

The result is a valuable collection of data bearing not only upon the cement industry and the determination of cement prices, but also upon the meaning of uniformity and stability in prices; the relation of the latter to combination and competition in price-making; the tests or criteria of fair prices, normal prices, competitive prices; and finally, the amount, rate, and reasonableness of the profits which Eastern cement producers have realized in recent years, published in book form, "Portland Cement Prices: Their Basis, Character and Present Position," by the Ronald Press.

ıking Men Over" Policy ıown in New State Prison

aking men over again" is the way ding Illinois manufacturer described olicy of the Joliet penitentiary. He number of other manufacturers, mem- of a committee of the Illinois Manu- ers' Association, had just visited the state penitentiary at Stateville, six from Joliet. The prison is the most rn in the world. It was planned and under a commission consisting of manufacturers—James A. Patten, Ira opley and the late John Lambert.

ıe illustration shows one of the new lar cell houses. The guard's tower e central observation point affords con- supervision and control by one officer. cells, although small, are almost as fortable as the rooms you will find ome modern hotels, well ventilated, white enameled lavatories and other eniences including drinking water. re are eight of the cell houses radiat- around a circular building where the ng hall is located.

We have here," said John L. Whitman, erintendent of Prisons in the State of nois, "a progressive merit system that pares the prisoners for good citizenship a form of prison construction that fa- tates such training."

he progressive merit system as out- d by Mr. Whitman follows:

. Confinement within the prison and jection to all the prison rules, with very little, if any, personal responsibility.

2. Increasing opportunity to merit more confidence on the part of prison authorities, by strict application to industry and adherence to prison regulations.

3. Positions of trust within the prison walls.

4. Life in cottages outside the prison walls; but under supervision of the prison officials.

5. Work on the prison farm, without guards.

6. Parole.

7. Freedom.

AUTOMOBILE—AVIATION

75% of Motor Cars in U. S. Are in Rural Districts, Says Survey by National Automobile Chamber of Commerce

ACCORDING to the most recent available figures compiled by the National Automobile Chamber of Commerce, only 25 per cent of the cars in use in the United States are in the 148 cities having a population of 50,000 or more, while 75 per cent of the cars are located in the 56,506 cities, towns and villages of from 50,000 down to 1,000 or less. Of the cities in this group, 55,177 are of less than 5,000 population and more than 50,000 postoffices are of less than 1,000 population. From this it will be seen how large a factor the farmer is in building the sales volume of dealers in these towns that contain 75 per cent of the automotive trade of the country.

The following is the tabulation showing the distribution of cars and trucks according to size of cities:

12	Cities over 500,000	9%
136	Cities 500,000 to 50,000	16%
1,329	Cities 50,000 to 5,000	20%
5,029	Towns 5,000 to 1,000	22%
50,148	Towns under 1,000	33%
56,654	Cities and towns in U. S.	100%

The National Automobile Chamber of Commerce after quoting these interesting figures, makes this strong statement for the farm market:

"From these figures it seems probable that the biggest increase in use of the automobile in the next few years will come in farming areas. No occupation gets more value out of the motor car and apparently a large part of the need is as yet unsupplied. There are other points than population, however, to be taken into consideration, such as income and roads. Since much of the farmer's income is in elements other than cash, it is difficult to make a comparative study on this basis. The rural highway situation, though, is rapidly improving as is evidenced by the fact that federal, state and local road construction is going ahead at the rate of more than 20,000 miles per year.

"Other factors which point to an increased rural use of motor transportation are the fact that the distances are great, giving consequent importance to the saving of time. The uses of the car in connection with farming are manifold, extending in some cases even to the running of a buzz saw and the operation of a lighting plant. Furthermore, the country owner has little expense or worry about parking and garaging."

High Sales of Oldsmobile

Sales of the six-cylinder Oldsmobile for the first quarter of 1924 broke all records, with a total of 21,214 cars sold. Sales for the corresponding period in 1923 totaled 7,635 cars; for the first quarter of 1920, the previous high first quarter, 8,588 cars. The high sales for the first three months of 1924 are, in a way, the more remarkable from the fact that for the first time in many years Olds Motor Works is concentrating on one chassis—something that it has not done since the days of the curved dash runabout.

R. T. Keller Is Promoted

Alfred P. Sloan, Jr., President, General Motors Corporation, announces that K. T. Keller, formerly Manager of Production of Chevrolet Motor Company, has been made General Manager of General Motors of Canada, Limited, with headquarters at Oshawa, Ontario, Canada. R. S. McLaughlin is President of General Motors of Canada, Limited.

40,000 Busses in Operation

Recognition of the motor bus as a permanent factor in transportation has been made clear in twenty-nine States by enactment of regulations relating to busses as common carriers; such legislation was passed in six of these States during 1923. The growth of travel by bus in these states is shown by 1923 figures. New bus lines have been established in large numbers, routes have been extended and fleets have been increased. More than 40,000 busses are now operated in the United States by bus and railway companies.

Auto Sales Decrease

"February sales of new automobiles and motorcycles in the five states including the Seventh Federal Reserve District amounted to $120,589,386, a decrease of 42.6 per cent from those in January and a gain of 18.5 per cent over those of February, 1923," says a report by the Federal Reserve Bank of Chicago. "Sales in these five states during 1923 were equal to 86 per cent of the total for the entire country.

"The February sales of new automobile trucks and motor wagons were $16,881,437 or 42.1 per cent below those in January and 42.2 per cent above those of the same month a year ago. Sales of parts and accessories during the month aggregated $7,588,721, a loss of 63.1 per cent from the sales of January and 49.9 per cent from the figures of a year ago.

"Total February sales of new automobiles and motorcycles for the entire United States aggregated $136,780,000, a decrease of 40.3 per cent compared with the sales of the previous month and an increase of 16.2 per cent compared with those of a year ago. The total sales of automobile trucks and motor wagons in February for the entire country aggregated $29,578,000, a decrease of 29.5 per cent from the total of the previous month and an increase of 25 per cent compared with the record of a year ago. Sales of automobile accessories and parts in the United States in February aggregated $42,599,000, a decrease of 26 per cent compared with the previous month and 38.7 per cent compared with a year ago."

Wire Wheel Patent Control

Control of the Cowles wire wheel patent by the Packard Motor Car Company of Detroit and the Wire Wheel Corporation of America has been confirmed after three years of litigation by a decision by Judge Cliffe in the United States District Court. The patent was contested by the Overland Motor Company of Chicago. The patent, granted in 1914, covers motor vehicles provided with five-wheel equipment, the fifth or spare wheel being applicable to either the front or rear axle. Officials of the Wire Wheel Corporation declared that under the decision manufacturers, dealers and users of wire wheels demountable at the hub are infringing on the Cowles patent.

Few Owners Insure Autos

Motor car owners throughout the United States paid a total of $294,000,000 for insurance on their cars during the year of 1923. This is an average of approximately $21 per car for every motor vehicle owned in America. Based on the fact that $150 will buy fire, theft and a moderate amount of liability insurance for the average medium priced car, the above figures would indicate that about one-seventh of the cars in the country are insured.

47 Makers Boost Car Prices

Dr. H. H. Hills, Vice-President in charge of distribution of the Packard Motor Car Company, has recently issued a statement giving a tabulation of motor car prices showing that since February, 1923, there have been forty-seven price increases by leading motor car manufacturers, ranging in amount from $15 to $390, with an average of $79.83. The Packard Company during that period, Mr. Hill points out, has actually made a reduction in price of its cars.

onomic Outlook for U. S. in 1924 Is Bright, Says Secretary of Commerce

E economic outlook for our own ountry for the next year is bright. In ral the world situation is hopeful. The ral spirit of prudence, the absence of ılation, complete employment, high uction, and the great financial strength stability of the important states in the tern Hemisphere, together with the nise of the early conference for systic consideration of constructive solu- of the world's greatest economic men- —Franco-German relations—all create opeful foundation on which the New r may build," said Secretary of Comce Hoover in a recent statement.

An economic weather chart of the ld would show three distinct areas.

First, the Western Hemisphere, Asia, stralia, and Africa, which have made inct economic progress during the past r, achieving a high degree of economic overy.

"Second, Russia, the Baltic, the Balkan ites, the Near East, Italy and Spain, ich are still struggling with afterwar litical, social, currency, debt, and budg- problems, but yet show undoubted ogress in the restoration of commerce d industry.

"Third, an area of economic depression sulting from the occupation of the Ruhr d the collapse in Germany. While most ute in that country, it radiates its de- essing influences strongly over Poland, zechoslovakia, Switzerland, Hungary, andinavia, Holland, and Great Britain. ance can well be placed in this group, cause the failure to secure reparations is contributed to an unbalanced budget d the resulting indirect inflation. This is concealed the true situation and has ven an artificial and forced draught to e industrial activity. The other coun- ies of the group are suffering from a dis- essing increase of unemployment.

"In 1923 the United States have wit- essed the highest total productivity and novement of commodities since the war, ith full employment, high real wages, reatly increased savings, large additions o home building, and the largest increase n railway equipment since the war. The whole has been accompanied by a remark- ible absence of speculation, consequent over-accumulation of consumable goods, or dangerous expansion of credit. As we are not in a boom we can expect freedom from a slump.

"Taking the country as a whole we never n history have enjoyed a higher standard of living and comfort nor so great a degree of commercial and industrial efficiency as today or so wide an understanding of the forces which control the ebb and flow of business. As severe as the situation has been in the worst of the agricultural states yet the disparity between agricultural prices as a whole and industrial commodities has lessened and the economic balance is tending to right itself.

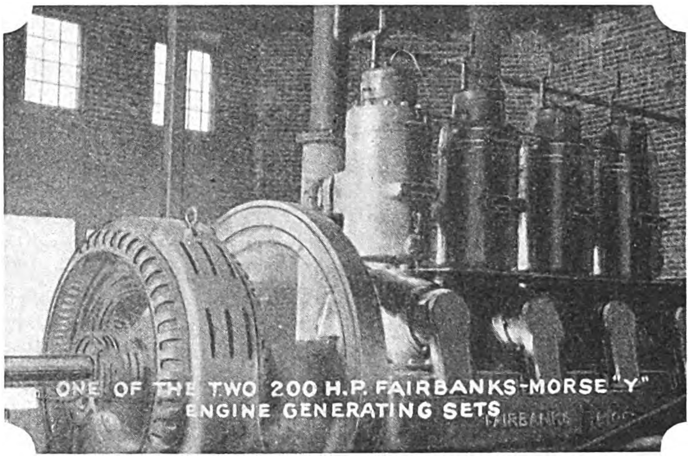
"Our country has exhibited extraordinary strength and progress. The basis of healthy business activity lies in balanced budgets, stable currency, high production accompanied by proportionate consumption and savings, with an absence of speculation, extravagance, and inflation. These things we have in the United States. We have even more in the hope of decreasing taxes. The odds are favorable to 1924."

Farm Values Down $19,000,000,000

Farm values have decreased $19,000,000,000 in the last three years, due to the deflation of farm lands following the unprecedented rise during the war boom. A report made public recently by a Department of Agriculture statistician makes the present value of the farms of the country $47,000,000,000, as compared with $66,000,000,000 in 1920.

Radio in Greenland

Denmark is to establish four radio stations in Greenland. They will be located at Godhavn, Godthaab, Angmagssalik and Julianehaab. The latter station will be able to communicate with the Icelandic radio station at Reykiavik and the Thorshavn station on the Faroe Islands.



ONE OF THE TWO 200 H.P. FAIRBANKS-MORSE "Y" ENGINE GENERATING SETS

HOW A BANKRUPT MUNICIPAL PLANT BECAME A MONEY MAKER

To illustrate the wide economy effected by "Y" Oil Engines, the city of Lubbock, Texas, faced with bankruptcy in their municipal water and light plant, decided to install Fairbanks-Morse "Y" Oil Engines.

In four years they were able to completely transform the plant from a bankrupt condition with a total valuation of $26,500, and outstanding obligations of $32,000, to a money maker, and at the same time reduce the rates for electricity to the lowest in the state.

To show the remarkable economy of the plant, the following statement covering the cost of operation was submitted by the City Manager.

*Two 200 H. P. Fairbanks-Morse "Y" Engine Generating Sets.
*Two 100 H. P. Fairbanks-Morse "Y" Engine Generating Sets.
Load factor, 65%.

Fuel oil cost, per month, @ 5½c per gallon	$ 841.50
Lubricating oil cost, per month, @ 47c per gallon .	105.60
Labor, per month	455.00
Waste and miscellaneous expenses, per month . .	25.00
Total monthly expense	$1,427.00

Production in Kilowatt hours per month, 180,000 K. W. H.
Cost per K. W. H. $0.0079.

These low costs have made possible in the Lubbock Plant a fine monthly profit after allowing for depreciation, replacement and retiring fund. They also made possible for Lubbock the LOWEST RATE FOR ELECTRICITY OF ANY CITY IN THE STATE OF TEXAS.

This is only one of many remarkable experiences with the Fairbanks-Morse "Y" Oil Engine, which we will gladly submit. The "Y" Engine is today the most widely used and successful of its type in the world. Back of it is nearly a half century of experience in engine building during which time we have built over 350,000 engines.

Upon request we will gladly send our engineers to give you full information.

**Since the above statement was issued, a third 200 H. P. Type "Y" Oil Engine has been installed, increasing capacity to 800 H. P. and increasing the plant valuation to $385,000.00.*

BUSINESS AND FINANCE

*"The Field of Investment"—Agricultural Credit Institutions and Insurance Companies as Capital Sources

IV

By C. W. SILLS

Vice-President, Halsey, Stuart & Company, Chicago

FIFTH, agricultural credit institutions.—To expedite and provide necessary capital for the financing of agriculture and to relieve the commercial banks of a part of this burden, Congress has authorized and provided certain institutions to do this financing. I refer to the Federal Land Banks, Joint Stock Land Banks, Federal Intermediate Credit Banks, National Agriculture Credit Corporations, Rediscount Corporations, and the War Finance Corporation. The first two institutions, which were authorized under the Federal Farm Loan Act of 1916, were designed to provide long term credits to farmers. These credits run not less than five years nor more than forty years, and are used exclusively for agricultural purposes in the purchase of farms, equipment, live stock, buildings, drainage, irrigation, etc.

Since their incorporation these institutions have increased very rapidly. As of Oct. 31, 1923, the combined net mortgage loans outstanding, representing credits advanced to farmers, were $1,157,587,000. During the eight years of their existence under the Federal Farm Loan System, Federal and Joint Stock Land Banks combined have made a total of 334,564 loans.

After the Federal Farm Loan System had been in operation for three or four years, it was found that while the long term credit requirements of agriculture had been taken care of, there still remained the problem of financing the shorter term "intermediate" credit requirements of the farmer. I say "intermediate" because the necessary loans for the raising, storing, marketing of crops, and fattening or breeding of live stock require a maturity of from six months to two or three years and, as such, are credits intermediary between those which may lawfully and safely be extended by commercial banks, and those extended by the Federal and Joint Stock Land Banks. Hence, the subsequent authorization by Congress of "intermediary" credit institutions of the type previously mentioned to finance these credits. The maturity of the various types of loans extended by such banks is from nine months to two years and in the case of the War Finance Corporation, loans may extend to five years, if the purpose is to "promote commerce with foreign nations."

While the Intermediary Credit Banks are comparatively new as institutions, the time will no doubt come in the near future when they will occupy a prominent position as an additional large source of capital for agriculture.

SIXTH, insurance companies.—Second only to banks and trust companies, as an institutional source of capital supply, are the insurance companies of the country. These companies, collectively, have many billions of dollars invested in stocks and bonds, representing the investment of premiums received. Inasmuch as these premiums are being paid in continuously, insurance companies are, more or less, constantly in the market for securities in order that they may employ these funds advantageously in furnishing protection to their policyholders, and in building up the necessary reserves against their outstanding risks.

At the close of the year 1923 it was estimated that the total assets of American Life Insurance Companies alone, based upon figures recently issued by the Association of Life Insurance Presidents, will closely approach $9,500,000,000. There is in force at the present time close to $55,000,000,000 of life insurance for which the American people, for protection, pay annually nearly $2,000,000,000 in premiums.

This statement shows that there are four major classes of security investments which exceed $1,000,000,000 in amount. The first and largest is an investment in real estate mortgage of $2,800,000,000 (in round numbers) which comprises over 35 per cent of the total assets; the second is represented by railroad stocks and bonds aggregating in excess of $1,800,000,000 or 23 per cent; the third is in the bonds of government, states, counties, and municipalities amounting to $1,450,000,000, or about 18 per cent of the total; policy loans come fourth totaling in excess of $1,000,000,000 and representing approximately 13 per cent of the total.

These statistics should be sufficient to show you the importance of insurance companies in the investment field, although these figures are given only for Life Insurance Companies and do not include the many other classes of insurance underwriters (casualty, indemnity, fire, marine, etc.,) whose investments each year mount into the hundreds of millions of dollars.

As a source of capital supply, insurance company funds lend themselves generously for investment in a field which is national, even international in its scope, responding to the legitimate demands of society, commerce and industry (the public, semi-public and private enterprises, both corporate and individuals). For the past sixty or seventy years, insurance companies have played an important part in the development of cities, factories, railroads, utilities and natural resources and, so long as insurance endures as an institution, will continue to lend support to the legitimate demands for capital in the further development of the country.

(To be continued)

Statement of the Ownership, Management, Circulation, Etc., Required by the Act of Congress of August 24, 1912

OF MANUFACTURERS NEWS, published weekly at Chicago, Illinois, for April 1, 1924, State of Illinois, County of Cook—ss.

Before me, a notary public in and for the State and county aforesaid, personally appeared John M. Glenn who, having been duly sworn according to law, deposes and says that he is the owner of the MANUFACTURERS NEWS and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher, Glenn & Company, 76 W. Monroe St., Chicago, Ill.

Editor, John M. Glenn, 76 W. Monroe St., Chicago, Ill.

Managing Editor, Jas. C. Gilruth, 76 W. Monroe St., Chicago, Ill.

Business Manager, John J. Glenn, 76 W. Monroe St., Chicago, Ill.

2. That the owners are (Give names and address of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.):

John M. Glenn, 76 W. Monroe St., Chicago, Ill.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of the total amount of bonds, mortgages, or other securities are (if there are none, so state): None.

4. That the two paragraphs next above giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company, but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

JOHN J. GLENN, Business Manager.

Sworn to and subscribed before me this 1st day of April, 1924.

HENRY R. BLOSS.

(My Commission Expires June 26, 1926.)

0,000,000 Japan Loan Boosts Capital Flotations

foreign loan of unusual size—$150,-000 by the Imperial Japanese Govern-t—aided materially in boosting the capital flotations in the United States ng the month of February, accord- to the *Commercial and Financial Chron-* of New York. The total for the month , like January, in excess of half a billion .ars — $535,532,594. This compares ı $536,082,690 in January, and gives a .l for the first two months of 1924 of)71,615,284.

'he February total aggregates well above five preceding Februaries, which were: :3—$384,309,429; 1922—$353,525,619; :1—$320,437,569; 1920—$282,498,365; 19—$279,478,199.

A comparison of the issues in January l February, 1924, with the first two ›nths of the preceding four years, lows:

924	$1,071,615,284
923	1,265,527,340
922	820,669,118
921	743,773,685
920	770,724,004

These tabulations include the stock, bond d note issues by corporations and by ıtes and municipalities, foreign and do-estic, and also Farm Loan issues.

ıibby, McNeill & Libby Do Big Business, Says Report

That the properties of Libby, McNeill & ıibby have been maintained in first class ›ndition during the past year is evidenced y the annual financial statement of the ompany, just issued. This statement to ıe shareholders shows that during the year ıded March 1, 1924, the Company added 947,768.78 to Surplus Account, which ow stands at $2,017,169.83, and in addi-on has set aside depreciation at standard ates amounting to more than $1,000,000. let working capital in the business has een increased $1,160,417.95, bringing this ›tal to $19,029,973. The statement shows ıe Company has $18,000,000 of outstand-ng 7 per cent cumulative preferred stock, nd 675,000 shares of common stock, par ı10.

President McDougall states that the Company's volume of business has in-creased during the year in both the do-nestic and foreign fields, all departments of the Company contributing to the in-crease.

Business Wealth of Nation Set at Over $320,000,000,000

The business wealth of the United States, or the actual value of real and other property, has increased to $320,803,862,000, according to preliminary estimates by the Bureau of the Census, Department of Commerce. This means that there is a property value for each citizen of whatever age, creed or color, of nearly $300,000, while the per capita of the total wealth is $2,918, an increase from $1,950 or 48.6 per cent.

Statistics of the country's wealth as of Dec. 31, 1922, revealed that the total wealth increased 72.2 per cent and the per capita wealth 49.6 per cent in the ten years from 1912. All classes of property increased in value in the decade except live stock, which decreased 6.9 per cent to $5,807,104,-000.

Taxed real property and improvements were valued at $155,908,625,000, an increase of 60.9 per cent; exempt real property (exclusive of national parks and monuments), $20,505,819,000, an increase of 66.5 per cent; farm implements and machinery, $2,604,638,000, an increase of 90.4 per cent; manufacturing machinery, tools and implements, $15,783,260,000, an increase of 159.1 per cent; railroads and their equipment, $19,950,800,000, an increase of 23.5 per cent.

Privately owned transportation and transmission enterprises other than railroads were valued at $13,607,570,000, an increase of 42.1 per cent; stocks of goods, vehicles other than motor, furniture and clothing, $65,983,607,000, an increase of 121.3 per cent; and motor vehicles, $4,567,407,000.

Bankers' Conferences

The Spring meeting of the Executive Council of the American Bankers' Association will be held at the Bon Air-Vanderbilt hotel, Augusta, Ga., April 28-May 1. The Eastern District Regional Conference of the Savings Bank Division, American Bankers Association, will be held April 24 and 25 at the Commodore Hotel, New York City.

Good-Will

All business has a *Soul* as well as a *body*. The body is factory or store, organization and goods. The *Soul* is the stamp on the public mind.

When that stamp is impressed by the desire to serve, by faith in the merit of the product, by courtesy, square dealing and sincerity of purpose, the reaction is Good-Will.

The potency of Good-Will is measured by its *earning power*. Earning power is the reflection of Service. When Service merits compensation *beyond* the current rate of interest on tangible assets it becomes Good-Will.

Good-Will is the personality of business. So long as Faith and Service are maintained Good-Will *must* grow; it cannot die.

The mark of personality is a great asset. Represented on the Balance Sheet or not, it can and should be periodically appraised on a scientific basis, its contributing factors determined and its value definitely known.

There is a well defined method of establishing the material value of Good-Will. It is based on *certain* facts and figures—carefully defined—accurately estimated.

In the reorganization or sale of a business, or in computing Inheritance Tax, the necessity of determining, accurately, the material value of Good-Will is especially apparent.

Unusually Heavy Business Failures Since Jan. 1, 1924

The outstanding feature of the statistics of business mortality for the first quarter of this year is the unusually heavy total of liabilities, due to several defaults of exceptional size that occurred in March. At $97,651,026, the indebtedness reported to R. G. Dun & Co., for that month rose above all previous monthly records and the aggregate amount for the first quarter, $184,865,571, has only twice before been equaled in any quarterly period—by the $218,000,000 of the first quarter of 1922 and the $194,000,000 of the fourth quarter of 1921.

The 5,655 commercial failures in the United States during the first quarter of the current year, moreover, have but four times been exceeded—in the first quarter of 1922 and 1915, the second quarter of 1922, and the fourth quarter of 1921, the high point being represented by the 7,517 defaults of the first quarter of 1922. Comparing with the 5,316 failures of the first quarter of last year, involving $138,231,574, the present returns show increase of 6½ per cent in number and 33 2-3 per cent in liabilities.

The abnormally heavy indebtedness for March, this year, is explained by the fact that four manufacturing defaults alone supplied 60 per cent of the total sum reported, and one—a chemical company in the South—had liabilities of $40,000,000, or fully 40 per cent of the aggregate for the month. Prior to March, the heaviest indebtedness for a single month was the $87,500,000 of December, 1921, and the second largest monthly amount, $79,300,000, was recorded last October.

P. W. Sommer, President of Keystone Steel Co., Is Dead

P. W. Sommer, President and General Manager of the Keystone Steel & Wire Company, Peoria, Ill., one of the largest industrial plants of that city, died suddenly last Monday, April 7, at the home of his daughter, Mrs. William C. Eckert, 6125 St. Lawrence Avenue, Chicago. Mr. and Mrs. Sommer had just arrived in Chicago for a visit with their daughter. A weakened heart, from which he had been suffering for some time, was the cause of death.

Mr. Sommer was born at Fairbury, Ill., 54 years ago. With his father, the late Peter Sommer, and his brother, John, he founded the Keystone Steel & Wire Company in 1887 at Dillon, Ill., and later moved the general offices to Peoria.

Sanitary Engineers to Meet

The annual convention of the American Society of Sanitary Engineers will be held in Philadelphia on Sept. 16, 17, 18 and 19, 1924. This is the first time in the twenty years since the organization of this society that it has gone East to hold its annual meetings, all others having been held in the Middle, or Far West.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

the 966 gas utilities in the United States, only fifty-one, or 5 per cent, under municipal ownership. These one municipal plants supply 6,000,- 00 cubic feet of gas, while the pri- ·-owned plants supply 365,000,000,- ubic feet. In other words, municipal rship supplies 1½ per cent of the gas nt, while private ownership supplies per cent, according to a recent state- issued by the National Association of way and Utilities Commissioners.

the more than 9,000,000 gas meters ie, municipal companies have less than 000. Of the 70,000 odd miles of gas ns in the United States, the municipal panies have less than 1,900, and out total of 45,000,000 persons served by ufactured gas, only 762,000, or less 2 per cent, get their gas from city- ed plants.

he fifty-one municipal properties are ated in thirty-one states, the largest nber of plants for a state being Minne- with six, Virginia with five, and Geor- Iowa and Massachusetts with four each. largest plant under municipal control n Omaha, with total annual sales of 96,000,000 cubic feet. The two next are hmond, Va., with sales of 1,150,000,000 ic feet, and Duluth, with sales of 802,- ,000 cubic feet. These three plants, ording to official statistics, sell approx- ately 80 per cent of the total amount gas sold by all the city-owned plants the country. The remaining 20 per it is sold by companies operating in all towns, summer resorts and hamlets, h twenty-four companies having less n twently miles of gas mains each.

Six Kansas Utilities Merge

A merger of six public utility properties Kansas under the control of one com- ny, the Kansas Public Service Company, th assets of more than $13,000,000, was icially announced by the Illinois Power Light Corporation, which owns the com- inies affected by the consolidation.

The consolidation takes in the Topeka ailway and Light, the Atchison Railway, ght and Power, and the Wichita Railway nd Light companies, all owned by the Illi- ois corporation; the Topeka Edison and e Topeka Railway companies, both owned the Topeka Railway and Light Compa- y; and the Kansas Power and Light ompany.

Officers of the Kansas Public Service ompany are: Clement Studebaker, Jr., resident; William A. Baehr, H. L. Han- ey, Vice-Presidents; Scott Brown, Vice- resident and Secretary; George M. Mattis, reasurer. Directors are Clement Stude- aker, Jr., William A. Baehr, H. L. Han- ey, Scott Brown, John W. Esmond, P. C. ings and George M. Mattis.

G-E Employes Buy Company Bonds

Employes of the General Electric Company are owners of, or are paying on the installment plan for, a total of $11,458,260 in G-E Employes' Securities Corporation bonds. The number of the Company's employes who have subscribed to these bonds, which pay 8 per cent as long as the individual remains with the General Electric, is around 267,100.

Police Called Phone "Nuisance"

When the telephone was first introduced in police headquarters in Chicago—in 1885—it was regarded as a nuisance and was soon removed to an outer office. It is hard in these days, though, to visualize a police department successfully operating without the aid of the telephone.

If it were not for the patrol box and police alarm system, many criminals would succeed in making their escape, but so quickly are alarms and descriptions now flashed to all stations that arrests are often made before the culprit can get beyond the city limits.

Medals to Telephone Employes

Nine Illinois Bell Telephone Company employes have been awarded Theodore N. Vail medals for noteworthy public service in 1923. The are:

Elizabeth Byrnes, Supervisor, Oak Park.
William Jones and John Costello, linemen, Antioch.
Henry W. Radius and Robert T. Hattendorf, installers, Chicago.
Hewitt B. Garvey, transmission testing foreman, Chicago.
Henry L. Warner, plant man, Chicago.
Michael Sansone, building repairman, Chicago.
Howard B. Matteson, plant man, Morris.

This is the fourth year that medals have been given by the Company. These medals are provided from a fund established as a memorial to Theodore N. Vail, for many years head of the Bell Telephone System.

Portable Pipe-Threading Machine

A new portable pipe threading, cutting-off, and reaming machine has been brought out by the Williams Tool Corporation of Erie, Pa. The principal features are that it is portable, demountable, has a handy self-contained grinder and three drives—motor, belt and hand—built into the machine. It also has a wide threading, cutting-off and reaming capacity. A unique feature of the machine is that it can be converted into a power unit in 2½ minutes, and by using a flexible shaft it will operate hand stocks up to and including 8 inches. The weight of the machine, complete with motor and all standard parts, is only 520 pounds. It is easily removed to any part of the shop or taken out on the job where work is to be performed.

French Import Taxes

A cablegram recently received by the Department of Commerce from France states that, effective March 24, all import taxes have been increased 20 per cent.

FOR SALE
Complete Woodworking Plant
and
Retail Lumber Business

Thoroughly equipped, with up-to-date machinery to do all kinds of hardwood trim and mill-work, frames, sash, doors, etc., for dwellings and stores. Employing best of men, and good line of customers. Dry Kiln and Private Siding. Annual business $475,000.00. Established 23 years. Plant and stock can be purchased at right price. No Brokers.

W. N. 243 French St. Buffalo, N. Y.

QUALITY, PREPARATION
AND SERVICE

To claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

HARRISBURG COAL
Burns to a White Ash — Is Hand Picked
Has a High B. T. U. — Is a Thick Vein Coal
Is Shaker Screened
Is An Illinois Product

A Bridge Across the Years

MAKE it your rule to talk at least once a week by telephone to the son or daughter away at school. The cost of the service is a trifle compared with the joy of hearing the young people's voices and knowing they are well and in good spirits.

And it cheers them, too.

Illinois Manufacturers Mutual Casualty Association

(INCORPORATED)

A Service Department of the Illinois Manufacturers Association

The Illinois Manufacturers Mutual Casualty Association, Inc., has been organized by Manufacturers of the State of Illinois to furnish to the employers of the State efficient service in the solving of plant accident problems.

The Association through co-operation can effect a large saving on Compensation Insurance premiums each year and in addition furnish superior service to its policy-holders.

Full information and rates will be furnished prior to the expiration date of your present policy.

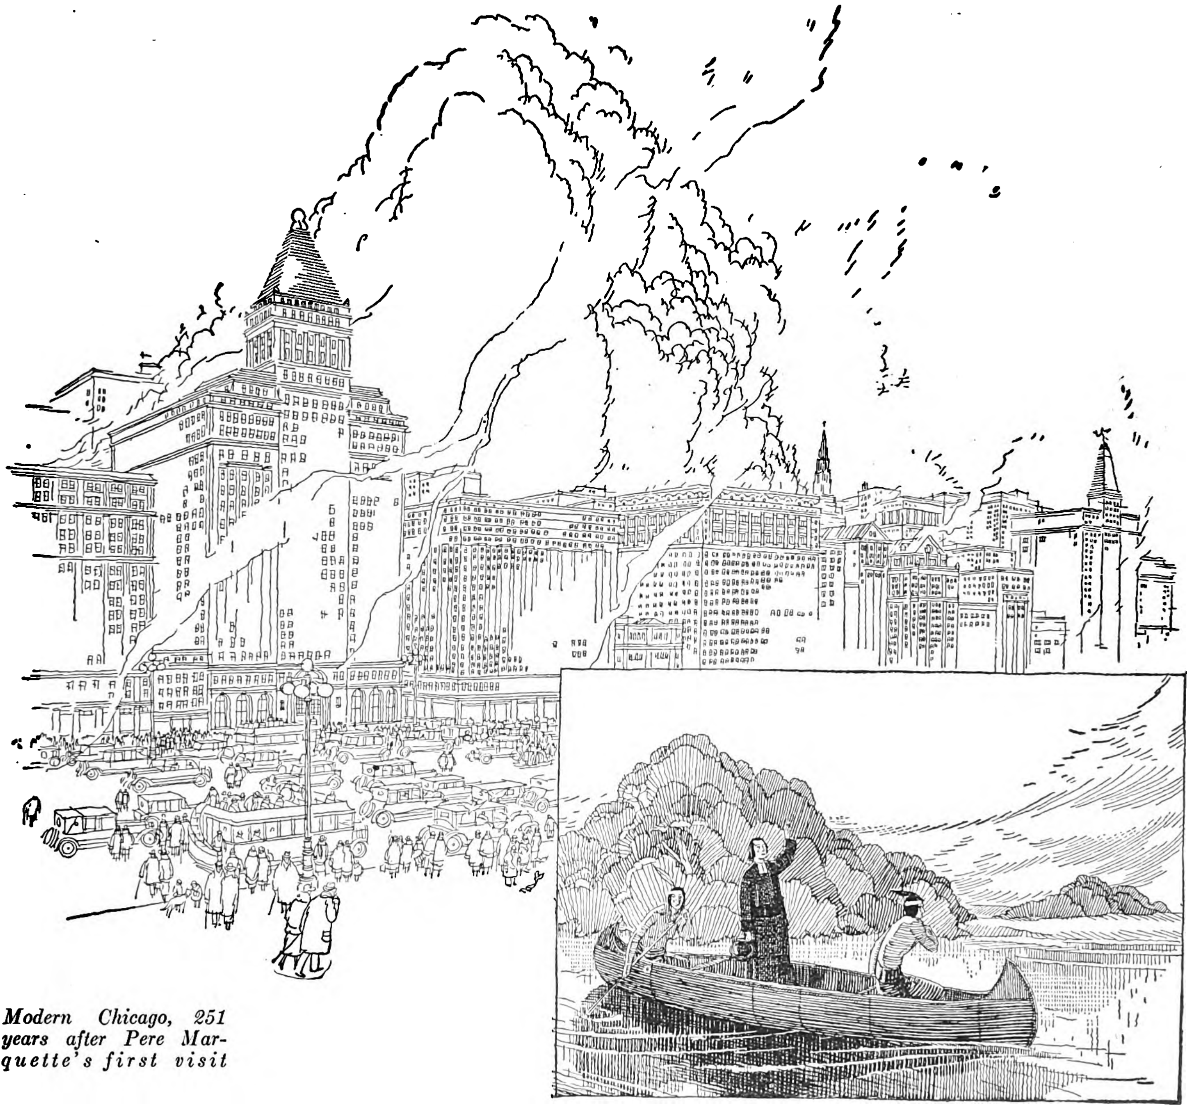
Manufacturers News is published every Saturday by Glenn & Company, 76 W. Monroe St., Chicago, Illinois. Subscription price $4.00 a year; 15 cents a copy. Entered as second class matter March 4, 1912, at the Post Office at Chicago, Ill., under act of March 3, 1879.

After April 28 our address will be 910 - 231 So. La Salle St.



Modern Chicago, 251 years after Pere Marquette's first visit

Pere Marquette bringing his message to the Indians of the Mississippi Valley, 1673

PERE MARQUETTE—gentle, fearless, self-sacrificing—zest of the explorer always overshadowed by zeal of the missionary—he was one of the few trail-blazers of history who was not governed by any thought of financial gain or glory.

People of the Mississippi Valley will always cherish the memory of "le bon Pere" and his companion, Louis Joliet, for they were the first Frenchmen to explore the Great River (1673) and the first to visit the spot where Chicago now stands.

It is not without a feeling of pride that we record the achievements of our illustrious namesake. With such traditions to inspire us, we would be unworthy of his name if we did not serve always to the limit of our ability.

Senator LaFollette's Popularity

ONE of the reasons why we have high Federal taxes is because so much money is wasted in order to give some of our United States Senators and Representatives material for political campaigns.

A case in point is the valuation of the railroad properties of the United States. Senator LaFollette for years has kicked, stamped upon, throttled, walloped in the eyes, knocked down and dragged all over a forty acre lot, the railroad systems of the country, because it makes him popular with the voters of Wisconsin.

One of his most successful attacks on the railroads was in 1913 when he made so much noise in the Senate that an act was passed requiring the Interstate Commerce Commission to make a valuation of the physical property of all the railroads. Senator LaFollette, at the time his bill creating the Valuation Act was pending in Congress, advised the Senate that "all railroads in the United States could be valued in two years' time at an expense not exceeding $2,400,000."

The sum of $2,400,000 perhaps would not be excessive to furnish campaign material for Senator LaFollette, especially as he probably needed it rather badly about ten years ago. However, the sum expended for valuing the railroads up to date has reached the total of $90,200,103, which is rather a tidy amount to pay for political propaganda. Of this amount $23,219,190 has been spent by the Federal Government, through the Interstate Commerce Commission, and $66,980,913 by the railroads.

We have nothing to show for this money. As George F. Kull, Secretary of the Wisconsin Manufacturers' Association points out in a recent bulletin, "any railroad official could guess nearer the real value of our railroad systems than that given in return for the $90,000,000."

Erie Canal Centennial

THE One Hundredth Anniversary of the opening of the Erie Canal will be celebrated a year from next October, and New York is so stirred up about it that Governor Smith has requested the appointment of a commission to make preparations for its observation in a fitting manner. The Erie Canal has been somewhat forgotten in the rush of transportation progress, but it gave New York its first impetus to become a world port and had much to do with the opening of the Western states.

Reviving interest in waterways all over the United States has resulted from the increasing cost of railroad transportation and a desire to supplement service for the movement of heavy freight. The Mississippi Valley Association has comprehensive plans for the development of the waterways of the Middle West and the Illinois waterway is the weakest link in the chain, for unless it can be constructed upon a scale sufficiently adequate to allow economical transportation by means of modern barges, the Mississippi River project and the St. Lawrence enterprise will come to nothing.

Waterways were badly needed in the United States when the country was young and the people were few. They are still needed now that the population has increased so enormously, and economic transportation by rail has been made difficult by the increasing cost of operation.

New and Larger I. M. A. Headquarters

THE Illinois Manufacturers' Association will move into new and larger quarters in the Illinois Merchants Bank Building, 231 South LaSalle Street, in the block bounded by LaSalle Street, Jackson Boulevard, Quincy and Clark Streets, on Monday, April 28.

The growth of the Association's business has necessitated more extensively and more conveniently arranged quarters and the new offices, consisting of Suites 910, 915, 917 to 930 inclusive, will constitute a model assembly for Association activities.

The new headquarters, which have been leased for five years, will embrace approximately 7,228 square feet. In addition to being occupied by the Illinois Manufacturers' Association, there will be ample space for the Illinois Manufacturers' Mutual Casualty Association, Incorporated, and for Glenn & Company, publishers of MANUFACTURERS NEWS.

Now Is the Time

THOSE who have views on the pending immigration legislation in Congress should express them now to their representatives. Do not wait until the automobile is stolen before locking the garage. Now is the time.

Employers generally seem to be well satisfied with the provisions of the pending measure, notwithstanding the scarcity of help that will attend any increase in industrial activity. This attitude would seem to indicate that most employers place the interests of their country ahead of selfish business considerations.

There is no doubt but the further restriction of immigration will cause a scramble for labor and consequently increase the cost of operation and the cost of living.

It does not seem to us that what is known as the American element in the large industrial centers is informed as to the general conditions among the class of people known as foreigners. The assimilation, concerning which so much is said, is going on more rapidly than is generally supposed and the average foreign-born citizen participates much more intelligently in elections and the duties of citizenship than most people believe.

As to Japanese exclusion, that is largely a matter of prejudice and nothing can be done to solve this question until the scales fall from the eyes of the American people and the Japanese show a more rational attitude. The labor unions, while in our judgment not entirely responsible for the restrictive legislation, have fanned the prejudice.

One Reason for Unemployment

MINE operators in Missouri, Kansas, Oklahoma and Arkansas have closed their mines rather than submit to the war time wage scale of the United Mine Workers of America, who believe that two birds in the bush is better than one bird in the hand. The miners, perhaps, can find work at something else, but not at $7.50 a day in the Southwest. They might take up plastering.

Suggests Pay Roll Tax

A PAY-ROLL tax, based on something like 5 per cent of the pay roll of factories and other business enterprises, is suggested in a letter sent to Senator Reed Smoot, Chairman of the Senate Finance Committee, this week by George R. Meyercord, President of the Meyercord Company and one of the Advisory Committee of the Illinois Manufacturers' Association. Mr. Meyercord says it would be far easier to administer than the sales tax, which Senator Smoot favors, and would be absolutely unbeatable.

t. Lawrence Route Aid to Business

Connecting Great Lakes With U. S. Eastern Seacoast Will Equalize Transportation Costs for Middle West

By JOHN S. PARDEE

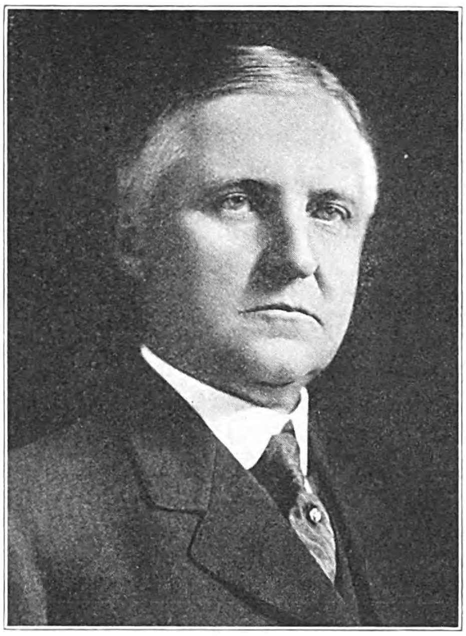
Assistant Executive Director,
Great Lakes-St. Lawrence Tidewater
Association, Duluth, Minn.

THE economic proposition," said Secretary of Commerce Hoover to the newspaper men, "is proved; the engineering feasibility is established. The St. wrence project is going to be executed; only question is when."

t is going to be done, and the whole intry knows it. Even in those narrow les where they are vaporizing about the rmous difficulty and the impossibility salt water boats navigating in fresh ter and all that truck—they know it is ing to be done.

The new St. Lawrence Commission, apinted by the President in March with cretary Hoover as its Chairman, is not ing to waste any time threshing over old aw. It means business. It will address elf to the purpose outlined by Secretary ghes, in the appointment of the Engiering Board of Review, "that the project r the improvement of the St. Lawrence ver for navigation and the development its water power may be carried forward speedily as possible."

In a word, this is what has been accomished since the invitation to Canada was newed by President Coolidge last November. A joint engineering board is to be pointed forthwith to review the plans itherto recommended; each Government appointing a National Committee to forulate a national policy; it is agreed that ere is to be mutual consideration of cerin collateral problems. Secretary Hoov's Commission is instructed, in addition, at if it finds that the project should be ndertaken at the present time then it will lease "consider the formulation of such rojects as might be submitted for international agreement on construction, fiances, and administration."



CHARLES P. CRAIG
Vice-President and Executive Director, Great Lakes-St. Lawrence Tidewater Association

There is thus established a joint review of the engineering plans, separate consideration of the national policies and a direct approach to international planning.

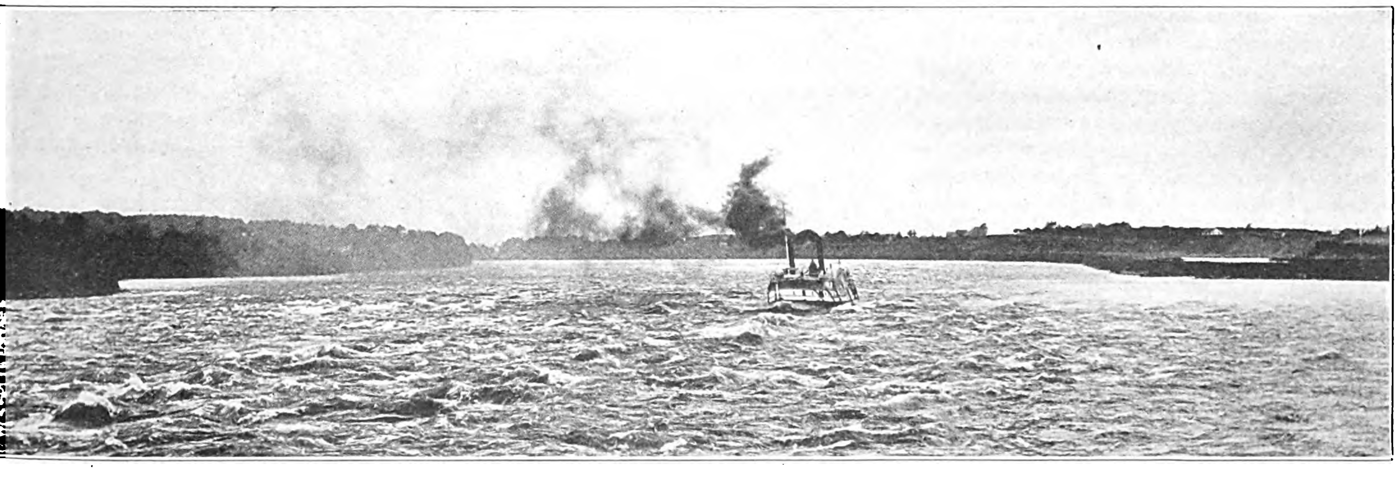
Mind you, the Canadian Government has scrupulously refrained from consideration of the international project so long as there is any question about national policies—quite logically. But there are certain indications as to the Canadian national policy. For the last four years an annual appropriation has been made of $10,000,000 or $12,000,000 for continuing work on the new Welland Canal, which will be completed within three years. And each time some member of Parliament has raised the question, "Won't that money be wasted unless the St. Lawrence River project is going through?", and each time the spokesman for the Government has made it very clear that it knew exactly what it was doing and that the relation of the new Welland Canal to the Lakes-to-Ocean route was clearly understood.

In the second place, the Province of Ontario insists upon developing its power rights in the St. Lawrence River, and has brought matters to a head by demanding that the Dominion, having the superior right of navigation, either go on with the St. Lawrence project or stand aside and let Ontario Province develop its power.

Canadians Now Hesitate

It has been pointed out by Canadians that Ontario's right to develop its power cannot be denied, and the Dominion's interest in the navigation project cannot be waived. So we have this rather curious situation that in Canada, where all parties have for years been agreed on the execution of the St. Lawrence River project, they seem less ready to go ahead at this moment than in the United States where, until recently, the consensus of public opinion was rather uncertain.

There is very good reason for the rapid development of public opinion in the United States. The Middle West wants the St. Lawrence River outlet to the ocean, because we need it in our business. The farmers need it. A part of their produce will



Courtesy, Great Lakes-St. Lawrence Tidewater Assn.

LONG SAULT RAPIDS IN ST. LAWRENCE RIVER

No Boat Can Go Up The Rapids and Only Smaller Ones Can Run Down Stream; On Right Can Be Seen Short Stretch of Canal, Which Is To Be Enlarged for 33 Miles to Admit Ocean-going Steamers always be exported, and a very large part is consumed on the Atlantic seaboard. Up to a thousand miles that does very well, but where there is a rail haul of 1,500 miles or more the tolls are a pretty heavy burden. When the St. Lawrence River is open the farmer can ship his products from 300 to 600 or 800 miles to the nearest lake port and enjoy water rates, not only to the export market, but to the consuming markets on the Atlantic Coast. What is true of the farmer is equally true of the manufacturer in the Great Lakes district. The Lakes-to-Ocean route will open markets to him which are now forbidden.

Now, everybody knows, everybody always has known, that water transportation is cheaper than land haul. But the fact has lately been brought home to the business world with peculiar emphasis. Panama Canal traffic has more than doubled. San Francisco is nearer to Boston than Chicago is to New York. California announces that the Pacific Coast has been moved Eastward to Ohio. A steel manufacturer can ship from Pittsburgh or Youngstown to Philadelphia and from there to San Francisco or Portland and from there back as far as the Sierras cheaper than the Chicago manufacturer can ship into the same territory.

Rail rates average 11 mills per ton-mile. That includes, of course, a great deal of short haul stuff that moves on much higher rates, and it includes a great deal, of course, of low rate commodity movement. And yet it is a fair average figure for long distance rates on steel products, canned goods and the like. Average vessel rates for the same range of merchandise will run about 1.5 mills per ton-mile. Before the war the Interstate Commerce Commission, after an extensive study, came to the conclusion that the ratio between rail cost and vessel cost was about one to seven. Extensive studies in freight rates made in the last year, singularly enough, bring out the same one-to-seven ratio.

Affects Illinois Manufacturer

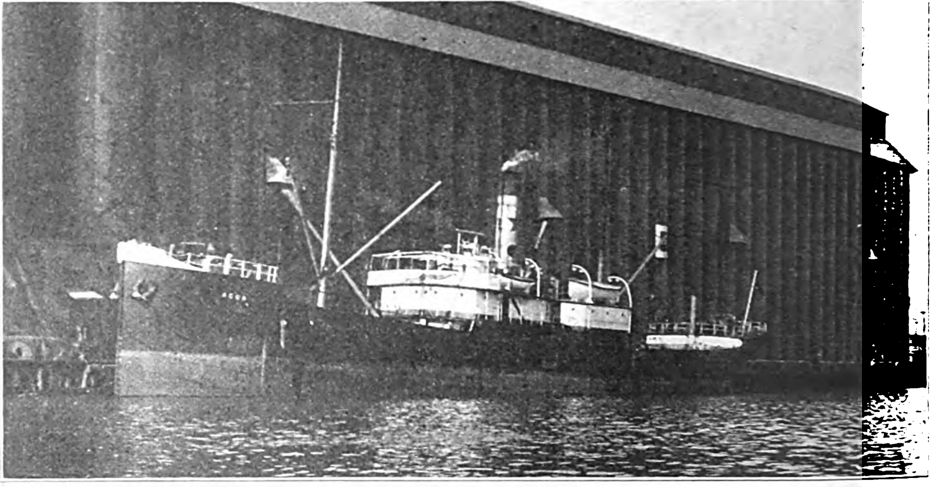
How this will affect the position of the Illinois manufacturer in export trade is obvious. But it is only lately that the country has begun to realize how the St. Lawrence River improvement will extend the Coast line of the United States. Puget Sound shipments, which now circumnavigate the country, and from Philadelphia or Baltimore repenetrate as far as Ohio and Indiana, those same shipments going around three sides of the United States may as well as not turn the fourth corner. The same boats that ply between the Atlantic and the Pacific seaboards can as well as not extend their voyage to the lakes.

From Chicago to Seattle for example by rail the existing rates must earn on the average $24.50 per ton, not less than $1.25 a hundred. By water, the same range of commodities, with the same profit as the same boats earn between New York, say, and San Francisco, could be carried for an average of $14.50 per ton, not more than 75 cents a hundred.

Illinois manufacturers have hitherto been handicapped by the introduction of Panama Canal traffic. It has ruled against them. The development of the Mississippi-Panama route promises to reduce the handicap. The introduction of the Lakes-to-Gulf route will still further improve the position of the Illinois manufacturer. Finally the opening of the Great Lakes to the entire seacoast of the United States will confer upon the Illinois manufacturer complete equality of transportation cost in comparison with the Mahoning Valley or Pittsburgh or the Piedmont region. It will give him equal access to all markets.

Manufacturers In Illinois Urge Speedy Tax Revision

Letters from manufacturers all over the State of Illinois are coming to the Illinois Manufacturers' Association calling on Congress to pass the Mellon Tax Bill in its original form in the interest of industries, business and employes in the state. These letters are in response to a request by the Federal Tax Committee of the Association asking its membership to give its views on the Federal income tax question.



Courtesy, Great Lakes-St. Lawrence Tidewater Assn.

SS. "AGGA" OF NORWAY AT PORT ARTHUR (LAKE SUPERIOR) DOCK

Ocean Freighter Small Enough to Pass through Present St. Lawrence River Locks; Larger Locks and Deeper Channel Would Permit Ships of Greater Tonnage

The leading points made by the manufacturers in their letters are:

When the Mellon Tax Plan was originally presented, the stimulating effect on business was immediate;

After the Longworth substitute was adopted by the House, industry began to lag;

Failure on the part of the Senate, during the past month, to agree upon a scientific tax revision plan that will raise sufficient revenue and at the same time reduce burdensome taxes, has caused many factories to slow down and lay off employes because they are not getting orders;

If the Mellon Tax Revision Plan, or something substantially like it, is adopted, manufacturers believe that business will promptly recover.

Among the leading manufacturers who have written to the Association are:

Joseph Triner Company, Chicago; Theo. B. Robertson Products Co., Inc., Chicago; Union Malleable Iron Company, East Moline; Novelty Iron Works, Sterling; Morris Bros. Shoe Company, Quincy; Mueller Company, Decatur; Monsanto Chemical Works, St. Louis, Mo.; J. Capps & Sons, Ltd., Jacksonville; Alfocorn Milling Company, St. Louis, Mo.; Moorman Manufacturing Company, Quincy; Geo. D. Roper Corporation, Rockford; The Studebaker Corporation, South Bend, Ind.; Pilcher-Hamilton Company, Chicago; O. W. Richardson & Co., Chicago; Universal Portland Cement Co., Chicago; The Buda Company, Harvey; Mudge & Company, Chicago.

Agricultural Products Up $960,000,000 Over 1922

The aggregate value of crops and livestock products, including animals raised produced in the United States last year is estimated at $12,204,000,000 by the United States Department of Agriculture. This was $960,000,000 more than the estimate for 1922. The total includes $9,953,000,000 for crops, and $6,111,000,000 for animal products, less an allowance of $3,860,000,000 which is the estimated value of crops fed to livestock.

The crop value last year was larger than for any year prior to 1917, the year the United States entered the World War, and was larger than for 1921 and 1922. The value of livestock products exceeded that for every year before 1918, and also for 1921 and 1922.

New Lumber Loading Record

A new record was established for forest products loadings during 1923 when the railroads handled 3,745,485 cars. This was an increase of 27 per cent over the loadings of 1922 which totaled 2,939,046 cars, 51 per cent over the 1921 loadings of 2,486,581 cars and 22 per cent above the 1920 mark of 3,057,730 cars.

The total loading of all commodities for the year, according to reports of the American Railway Association, was the greatest on record, being 10.4 per cent in excess of the previous high mark of 1920. The number of cars were 49,814,970 of which merchandise and miscellaneous freight comprised more than half. The other products in order of their loading were coal, forest products, grain and grain products, ore, live stock and coke.

Reforestation In U. S. a Public Duty*

Governments, National and State, Should Regrow the Forests; Wood a Most Important Economic Necessity

By EDWARD HINES

President, Edward Hines Lumber Company, Chicago

FROM the time of the landing of our forefathers on the shores of New England down to the present time, the primal objects of mankind in this coun- have been to supply food for sustenance suitable shelter and domicile as a ns of protection from the elements. all materials used for providing homes our people, lumber has played the most portant part. For furniture, in the arts, mill construction, even to the demands fireproof construction, the product of American forests has been and still ntinues to be the cheapest and most eful of all materials available, and spite the intrusion of a great many called substitutes, wood in various apes and forms continues to be an nomic necessity, fulfilling, as no her material can, the fundamental cessities of economic importance. om the modest dwelling of unpretentious proportions to the mansion; from e farmer's corn crib to the greatest dustrial development in factory ilding, to say nothing of innumerle products of more recent years, ch as automobile bodies, agricultral implements, battery boxes, musil instruments of all kinds, the radio, d even to the navigation of the air aeroplanes, wood has yielded nothg to any other material or substance playing an important part in the ructural needs and demands. It stands day pre-eminent in its wide uses, and still retains supremacy in the field being the cheapest of all materials en superiority, longevity and utility e primary considerations.

Forty years ago the lumbermen of ichigan prophesied that there would sufficient lumber in Michigan to ke care of the development in this untry for fifty years. Nature was ry kind to Michigan in providing her ith forests of the finest stand of timber, pecially of real White Pine, the truest of l woods; nature provided her with the atural means for the cheapest and quickt transportation of the timber to available points for manufacture, on Lake lichigan and Lake Huron, with streams om various lake ports, enabling the lumermen, when the timber was cut, to transort the saw-logs in the Spring of the year the quickest possible manner to the lake. From these various lake ports of manuacture the greatest markets of the United tates were opened by lake traffic, to transort the finished product at a cost, compared with what lumber is being transorted today, at but 5 per cent to 10 per cent of the present cost. Lumber was transported in the early 80's from the various lake ports by the old-fashioned sailing schooner and later by steel barges, at a cost of from $1 to $1.50 per thousand feet, green from the saw, to Detroit, Cleveland, Buffalo and Chicago. Today the cost of transporting lumber from the forests that provide the largest percentage of finished products to these various cities,—from the Yellow Pine belt along the Gulf of Mexico,—the freight rate ranges from 38 cents to Chicago, 44½ cents to Cleveland and 43 cents to Detroit; from the Pacific Coast—70 cents to Chicago and 90 cents to New York City. The cost of transporting this material by car is $200 to $250 per car to Chicago; $250 to $275 to Cleveland and Detroit, from the South; from the Pacific Coast to Chicago—$375 to $400; Cleveland and Detroit $425 to $450; New York City $500 to $550 per car. In other words, the cost from the South today is more in freight alone than (when I commenced business) the same class of material could be delivered by boat to the yard in Chicago, including the timber, the cost of logging, the cost of sawing, and the cost of transportation; and from the Pacific Coast the freight is twice, in many cases, what the finished cost was in the early 80's. Hence, you can appreciate why what looks like high prices today, as compared with forty years ago, is very largely made up in the cost of transportation.

Edward Hines

Unbalanced Distribution

One of the serious aspects of the Westward and Southward trend of lumbering operations, is the resulting unbalanced geographical distribution of standing timber. Three-fourths of the forest land lies East of the Great Plains; but these Eastern lands contain but one-fourth of the remaining virgin stumpage. This introduces again the subject of transportation. In 1920, the shipments of lumber ran about 1,680,000 carloads and the average haul was about 485 miles. The cost of transportation in freight and charters exceeded a quarter of a billion dollars, a sum that must be included in the sale price of lumber. In the six years prior to 1920 the rail haul of lumber increased 30 per cent and the average freight charge per thousand feet nearly doubled. This is the answer to those persons who look for America's future supply of lumber, to the 2,000,000,000 acres of forest land in South America, Africa, Asia and the East Indies. If freights within our own country are becoming prohibitive, what shall we say of lumber brought half way around the world? It becomes clear that one of the sharp problems of future forest practice consists of reforesting those non-agricultural cut-over lands east of the Plains country and lying close to dense wood-using population. As far as data available permit striking a balance, it appears probable that the remaining saw timber of the softer woods is disappearing about eight and one-half times as fast as it is being reproduced. Our hardwoods are disappearing about three and a half times as fast as they are being replaced. In making our estimates of the rate of actual consumption of our timber resources, we must not fail to take into account the disastrous losses from fire and the elements, the annual loss from fire alone approximating 7,000,000,000 feet.

The utilization of the tree in its entirety, rests as much with the public as it does with the manufacturer of lumber. The waste material not now deemed to be useful for general purposes, must be used up more closely and in the wider distribution of the product of saw-logs, the agencies through which lumber is marketed and distributed must become more unified in their activities to introduce for public use, the odds and ends that have been burned for want of a market.

---

*Abstract of recent address before the Pur- asing Agents' Association of Chicago.)

The subject of reforestation and conservation is, and has been for many years, a big subject of universal public interest. It is a very live and vital issue and extends in its ramifications from our Government at Washington to the timber owner and the ultimate users and consumers of the product of our great forest areas. In the past the lumbermen have done their share in assisting the officials at Washington, furnishing all information and advice they were able to give, and, today stand ready as in the past to lend, not alone the services of the great National Lumber Manufacturers' Association, with its various affiliated organizations in every lumber producing section of the United States, but, as individuals, to do anything to assist in this movement so long delayed and, from past experience, so important to the general welfare and the future of our country.

From the early New England days, forest growth had been seriously regarded as an impediment to agricultural progress and it is only within the past twenty years that this practice has been wholly stopped. This did not necessarily mean a waste of national resources. Agricultural development has always preceded industrial expansion. I am not so sure that had our natural forest growth in the United States been either preserved or replaced with a new growth, that there would not have been decidedly less industrial growth covering areas formerly timbered. There existed some needs for lumber sawn from the logs for purposes of providing shelter to the populace, but there was apparently a greater and a constantly growing need for the cultivation of the soil for agricultural purposes.

U. S. Uses Most Wood

The United States, more than any other country, with the possible exception of Russia and the Scandinavian peninsula, has built of wood and still continues to build on the same foundation. This country uses more wood than any other country in the world, and more than three-fourths as much as all countries combined. It uses half the saw timber consumed in the world and one-third of all the fuel wood.

When standing timber was plentiful and cheap, and industrial development in its infancy, wood and its products were, of course, freely used. In many parts of the United States the annual per capita utilization, exclusive of firewood, was equivalent to more than 2,500 feet board measure. Even today in frontier regions the per capita consumption of lumber used annually exceeds 1,500 board feet, and in some entire States exceeds 1,000 feet. But, for the United States as a whole, it is approximately 320 feet; as against more than 500 feet less than fifteen years ago. Despite a continuous growth in population the total annual consumption of lumber in the United States is not to exceed approximately 33,000,000,000 feet, as against about 45,000,000,000 feet fifteen years ago.

Statistical information compiled by the United States Forest Service estimated the original amount of timber in the United States as approximately 5,200,000,000,000 feet. The same authority has estimated the amount of standing timber now available, at 1,800,000,000,000 feet. In other words, 70 per cent of our original stand of virgin timber has been cut and this practically within a period of seventy years. The annual growth of timber in the United States is about 6,000,000,000 cubic feet and there is being used about 26,000,000,000 cubic feet. In other words, each year we use 4⅓ times more timber than we grow.

Of course, you want to view the past action of the lumberman fairly. His position was identically the same as that of the farmer in clearing the lands of Ohio and Indiana. In the settlement of the great prairie States, necessity demanded lumber. It was most available from our Northern forests and could be transported the easiest and cheapest from there. Necessity demanded that the forests be cut. The lumbermen, having bought these lands (and buying it for but one purpose—to cut the timber, manufacture it into lumber, and sell it the same as farmlands are bought to reproduce crops and sell them), were under no obligations, legally or morally, to conserve or reforest; and if they were under an obligation, it would be impossible to carry it out, considering the laws in the various States for taxation. In the earlier days, taxes were but an insignificant feature in carrying timber, but as the states were settled up, the need for good roads, public buildings and protection increased the taxes to such an extent that to attempt to hold timber, or conserve timber, would be equal to having the property confiscated through taxation, for there would be no revenue to take care of the carrying charges.

How could you induce private capital to engage in the business of reforestation when it cannot be shown that it would be a success from a financial standpoint, not even paying the smallest possible rate of interest? In the first place, there would be a cost to attempt to reforest; second, there would be a cost in looking after the young tree, such as keeping out fire and conserving it; third, unless the State would co-operate and provide tax exemption on land during the period of conservation or reforesting, the very taxes would of themselves more than over-balance what could be gotten out of the timber. To attempt to conserve the present timber supply in the face of state and local taxes cannot be considered.

You can appreciate there is no obligation, legally or morally, on the lumbermen any more than on any other citizen, to engage in the business of conservation or reforestation. The business of lumber manufacture is no more the business of growing trees than the business of flour milling is the business of growing wheat. Men who buy timber and operate sawmills are foresters only in the sense in which persons who buy coal lands and operate mines are geologists. The duty of conserving or reforesting is, therefore, a public duty—not a private one.

There is an unsound and impractical notion among some altruists who have taken upon themselves the importance of calling themselves conservationists, that the way to assure a future supply of lumber is to plant a tree every time one is cut down. Lumber is made from trees, to be sure, but from forest trees. Any given species of commercially valuable trees behaves quite differently in a forest than in a park. An isolated tree throws out vigorous lateral branches, comparatively close to the ground; while a forest tree, crowded by its fellows, grows tall with a straight stem, concentrates its branches at the top and reaches up for light and air. This is the tree for commercial purposes, the tree that yields a commercial product in lumber and is the only kind of a tree that supplies a merchantable product in lumber.

Vital Question—What To Do?

Now, the vital question of what to do confronts us. Nothing as yet of a national, state and community law has been passed, and as yet there is no real co-operation between the Nation, State, and Community in conservation and reforestation work. The question is: *HOW* can conservation, so far as protecting our remaining timber, be practiced and reforestation started along practical lines that will give an incentive to private capital to invest in it, and the public, in a secondary way, to invest in such projects. First, we have sufficient non-agricultural lands to supply the nation's timber needs if they are planted. This is the crux of the problem—that these lands be made productive. Our predicament is not so much of having cut out forests because of our necessities, but our failure to insist that *a new crop replace the old.* The majority report of the National Forestry Policy Committee of the United States Chamber of Commerce states that the non-agricultural land in the United States chiefly valuable for growing timber aggregates 465,000,000 acres, a very large area.

The investigations of the National Forestry Policy Committee have developed no more interesting and important fact than the potential wealth of the United States in these extensive timber areas—unless it may be our unbusinesslike attitude toward them. It is inconceivable that the American people who pride themselves on their business foresight should permit vast areas of potential timber land to lie idle in the face of an increasing shortage of forest products,—raw material absolutely essential to our nation's prosperity, and ranking in importance with iron, coal and oil. An ample supply of timber has been one of the important factors in our rapid development and in building up our national wealth. We cannot afford to be restricted to the low per capita consumption of Europe.

Very recently, the Senate Committee on agriculture reported favorably the McNary-Clarke Forestry Bill. The bill has many desirable features and, though not perfect, it is one which the Government and the States should co-operate with and should have the support of the practical lumbermen of the United States.

ʼresident Halts Senate Mellon Quiz

Hiring of Heney by Political Sharpshooters Resented by Chief Executive—Tax Bill Compromise Is Indicated

By JOHN M. TOWNSEND

Washington Correspondent, Manufacturers News

Washington, D. C., Apr. 16.—President Coolidge has again "smoked out" the political conspirators in the Senate who have been engaged in trying to wreck the Administration. Following
resignation of Attorney-General Daugh-
y the McKellar resolution, intended to
ɾe the way for sharp-shooting Secretary
the Treasury Mellon, was laid on the
ıle and the work of political reprisals
peared to be suspended for the time be-
;. In calling a halt on the efforts of the
uzens Committee in the Senate to in-
stigate, ostensibly, the Internal Revenue
reau of the Treasury, but, in reality,
cretary Mellon's income tax returns, both
ect and indirect, the President has un-
vered a left-handed conspiracy to get at
r. Mellon in another way. This time,
ing fully informed of the facts and
ubly armed by the doubtful legal meth-
s of the Senate Committee, the President
s pulled his coat off for a fight on the
rect issue of infringement of the rights
the Executive Department by senatorial
vestigating committees. Thus the foes of
e Administration in the Senate have been
rced to rally in the open, and to reveal
eir real purpose in the light of day.

COUZENS vs. MELLON—Senator James
. Couzens of Michigan, who is too new to
e Senate and too ill at this time to be
alt with in any but a charitable way, is
imarily responsible for the issue which
e President has elected to raise with the
nate as to the rights of co-ordinate
anches of the Government. Senator
ɔuzens originally became incensed at Sec-
tary Mellon because the latter disagreed
ith him as to the best principles of taxa-
ɔn and because Mr. Mellon took Mr. Cou-
ns' own statement as to his personal in-
ɔme affairs and wrecked Couzens' argu-
ent with it. Mr. Couzens immediately
ɔt the Senate to consent to an investigation
the Internal Revenue Bureau of the
reasury in which, Mr. Mellon agrees, bet-
r business methods are needed and the co-
peration of Congress to that end is neces-
ıry. The Couzens' investigation to date,
owever, has busied itself on only one sub-
ct—namely, the income tax returns and
ıe income tax settlements made by the
reasury with every concern with which
Ir. Mellon has ever been associated. Mr.
Iellon secured waivers from all these con-
ɜrns and furnished their income tax re-
orts to the Senate Committee, with the
ɜsult that the efforts of Senator Couzens
ɔ discover that Mr. Mellon has used his
fficial position to favor these concerns have failed. It appears, however, that in this dilemma, Senator Couzens listened to the blandishments of Gov. Pinchot of Pennsylvania, who had a controversy with Mr. Mellon over prohibition enforcement this Winter, and to Frank A. Vanderlip, who is conducting a personally organized bureau of investigation here, and concluded, without advising his Republican colleagues to hire Francis J. Heney to conduct a further investigation. Having no authority to pay Heney, Senator Couzens personally offered to pay the bill, a very doubtful legal step from every point of view. The President has not only denied the right of a single Senator to hire a private citizen to invade the confidential files of the Treasury Department, but he has raised the broader question as to the right of the Senate to invade any Department except for legislative purposes. Certainly an investigation of Secretary Mellon's income tax returns alone constitutes no basis for national legislation. The Senate, because the political sharpshooters control the Senate, may hire Heney officially, but that does not go to the heart of the issue. The President is boss of the Executive Department and will still have the last word as to what the Senate may or may not have in the way of information. The President has taken his position on the strongest grounds possible, and the Senate must defend the weakest case it has yet put up. The assertion of Senator Walsh of Montana that the President has taken a stand with Harry F. Sinclair in defying the Senate is sheer demagogy. The rights of a private citizen under the Constitution and the laws is one thing, and the rights of a co-ordinate branch of the Government against infringement by another co-ordinate branch is a totally different proposition. What Senator Walsh meant to say was that the Senate is really trying to get at an individual, Andrew F. Mellon, and not the Treasury Department. If this is not political conspiracy to wreck the Government, what is it? Senator Couzens, who is desperately ill at this time, is understood to have been fooled into the belief that Heney was a Republican, and it is understood that he intended personally to supervise Heney in his work. Until the Senate decrees what shall be done and until Senator Couzens is able to resume his duties, therefore, the incident may rest for the time being.

TAX LEGISLATION—The Senate is about ready to begin consideration of the Tax Bill, the Senate Committee having voted to report out the Mellon Plan with some changes in the House Bill as to other forms of taxation. This does not mean, however, that the Mellon Plan will finally be adopted by the Senate. On the contrary, the indications are that the Republican hyphenates will insist on raising the maximum surtax to not less than 32 per cent, with a view to final compromise with the House on 35 per cent, the rate which has been uppermost in the mind of Congress from the very beginning. The Democrats have also devised a new substitute fixing maximum rates at 40 per cent so that, if there is a compromise, they can claim they split the difference with the Republicans. The tax debate in the Senate will be a long drawn out affair with political fireworks a-plenty.

INCOME TAX PUBLICITY—In the Senate Tax Bill a new proviso has been added to the paragraph granting congressional committees the right to see income tax returns when requested by a Senate resolution which is liable to be heard from from one end of the country to the other. According to report, Senator Jones of New Mexico is the author of the new provision in the Bill which makes it mandatory on Collectors of income taxes to compile a list of all income tax payers in their districts together with the amount of taxes paid by them individually, this list to be maintained as a public document and open to the inspection of all comers. Outside of the Finance Committee nothing was known about this proviso in the Bill until copies of the measure reached the Senate floor, when astonishment was registered on both sides of the chamber.

JOHNSON BOOM COLLAPSES—Just as the Illinois primary in 1912 gave the necessary impetus to the Roosevelt candidacy which carried it through to the presidential elections that year, the Illinois primary this year has given a quietus to the Johnson campaign which makes further efforts on the part of the Californian to win the Republican nomination a futile effort. Senator Johnson is still entered in the primaries of eight states, in none of which, with the possible exception of California, are his prospects regarded as good. Nevertheless, Senator Johnson has announced his intention to carry on his fight to and through the Cleveland convention, but for what purpose is not clearly revealed. Senator LaFollette apparently has the inside track on any third party nomination this year, and there is little likelihood of Johnson and LaFollette ever remaining in the same camp, under any circumstances. As between Coolidge and LaFollette, Johnson is a middle-of-the-roader, with no terminal facilities anywhere.

THE DEMOCRATIC RACE—Gov. Al Smith of New York is out in front as a

Accountant's Duty Is to Provide Proper Financial and Cost Data; Executive's to Understand, Study and Use

By G. M. PELTON
Comptroller's Department,
Swift & Company

II

NOW, considering costs for plant operating department heads, it is obvious that statistics on the cost of manufacture and operating efficiency are the ns of guiding plant opera- s and maintaining power dards of quality and efficy. Two things are fundatal in connection with nt operations:

. The handling or manufacture roducts in the most satisfactory ner to meet competitive stands.

. To perform this service at the est possible cost and expense.

o not overlook the fact t competition is met in ry detail of plant operans and costs. Every saving de in a plant operating dertment is reflected in the al net results of the departnt and the business as a ole.

Merchandising men, or dertment heads, must, of urse, have costs if they are be in position to handle eir transactions intelligently d profitably. They are inrested in all elements enterg into costs—that is, financal, operating and merchansing elements—and should ve constantly at hand sumary information showing fin- costs, compared with their lling prices indicating to em the margins of final net rofits their daily transactions e showing.

Summarizing, this emphazes the need for departmenlization to make it possible bring about proper delegaon and placing of financial, perating and merchandising esponsibilities.

The method by which deailed and departmental financial and cost information may e supplied to the departnents, or employes in charge f, and responsible for, the arious functional activities of n industry, vary, depending n the nature of the operaions, the kinds of products handled, and he particular information required in ach case.

As already pointed out, different types of cost information are needed by those who are responsible for the proper administration of the buying, production and selling functions of a business. And, the kind of information needed by each varies in different industries, and in different businesses within a given organization. In a broad sense, however, granting that these specific kinds of cost information are desirable, the primary purpose of all costs are first, to assist in obtaining efficient management of a business in competition with other similar businesses; and, secondly, to aid in securing the best possible final net results on the invested capital.

PLAY BALL!

By
JAMES EDWARD HUNGERFORD

They are packed into the bleachers,
And the band's begun to play,
And the howling "ball fan" screechers
Are "on deck," in full array!
Our old friend, the vendor's copping
Of the coin—his goodly share,
And the hot peanuts are popping,
And there's popcorn ev'rywhere!

The big diamond is a-shining
In the sunshine, spick an' span,
Where the boys will soon be lining
Up—the mighty Big League clan!
After months of grilling training
In the far-off winter camps,
Where the swatters have been straining
To retain their jobs as "champs."

The spring air is sharp and nippy,
And the sunshine's full o' "pep,"
And the "fans" are feeling zippy—
Band a-playing jazz-time step!
Ev'rybody's at a tension,
With a flutter in their heart;
Eyes and ears are all attention—
Waiting for the game to start!

HERE THEY COME!—the Big League wonders!
Catching, pitching, batting braves!
Down the grandstand roll the thunders
Of applause, in mighty waves!
Forth they stride, with heads held proudly,
In their uniforms, brand new,
And the thousands cheer them loudly,
As they pass by on review!

HEROES!—ev'ry one a "winner,"
Who has won himself a name,
In the outfield, or the inner,
Or in some branch of the game!
Falls a silence on the bleachers,
And a voice is heard to bawl—
Stirring fifty thousand creatures
With a mighty thrill—"PLAY BALL!"

But important as it is to have correct cost figures, they are of little or no value in the administration of any business, unless proper use is made of them. The point is, that in every activity of any business, and in every department, it is the specific and direct application and use made of cost data that is of value. And this must be done in the light of other factors affecting the business, such as the supply and availability of raw materials; the demand for the manufactured products, the operating, merchandising, and financial facilities of the company; requirements in meeting competition; seasonal, product, and general business changes, etc.

Illustrates Methods and Scope

To illustrate: In our own industry and business the methods and scope of supplying cost information, and the uses made of it are somewhat as follows:

1. General executives of the business are informed of and use merchandising, operating and financial costs; in fact, all costs relating to the business as a whole.
2. Merchandising department heads receive and use all costs pertaining to their departments.
3. The buying staff uses cost information indicating what the selling prices of finished products will permit of paying for raw materials. They are interested in knowing the quantity and kinds of finished products demanded by the trade, the stocks on hand, the live stock receipts, etc. Live animals are usually purchased by quality and weight, and dressed costs and yields are usually determined by lots, as purchased. The dressed costs, yields and current selling prices prevailing, compared with the live costs, indicate what the buyers can afford to pay for live animals.
4. Operating men, such as Superintendents, Division Superintendents and foremen, each receive and use the kind of cost information which indicates the efficiency obtained in handling the operations for which they are held responsible. A Superintendent uses cost figures and statistics covering total plant operations. Each Division Superintendent is similarly supplied with, and uses production figures and statistics applying to, his particular division of the plant. Foremen

---

(*Final installment of recent address before llinois Manufacturers' Costs Association.)

of the plant departments are furnished detailed and total costs for their departmental operations, exclusive of gross and final results; and by using summary and detailed comparative statements of these costs, they are in a better position to intelligently and economically handle their operations.

Of course, it is recognized that the combined functional and departmental method of accounting is not used in all kinds of industrial organizations, many of which might be able to use it to advantage. As you know, many concerns summarize their production operations—that is, costs of materials, labor and factory expenses—on job tickets or cost sheets. Consequently, the identity of the separate elements of cost of goods manufactured is lost in many cases, as is also the opportunity for securing a complete and detailed accounting for the merchandising, operating and financial transactions applying to the particular classes of products. The production cost figures are buried in the cost of goods manufactured, and nowhere is there a general summarization of the combined detailed production, merchandising, and financial cost figures.

There are at least two fundamental disadvantages to this plan:

1. General executives, and also heads of merchandising and operating departments, do not get a connected and comprehensive accounting, from a complete business standpoint, for each class of products handled, or kind of business done. That is, the information is supplied to them on a piecemeal and disconnected basis, thereby practically eliminating the possibility of making complete and satisfactory analyses of the figures and statistics for the purpose of drawing proper conclusions.

2. It does not permit of adequate distribution of responsibilities to heads of operating and merchandising departments, and proper supervision from the standpoint of the general executive management.

The Departmental Statement

A departmental statement, on the other hand, if properly prepared contains full and complete information covering the financial, cost and merchandising operations and results of each department and class of products handled, i. e.:

1. It contains a record of the sales and the cost of goods sold. This permits of determining the gross or merchandising results.
2. It shows such information as the product gains, shrinks, and yields, total expenses, itemized by groups,—that is, those of a direct, indirect, fixed property and administrative nature, etc.
3. It shows the final net results of the department obtained before and after deducting operating interest, consisting of:
    a. Interest paid on borrowed money
    b. Federal taxes
    c. Dividends due and payable to stockholders, etc.
4. It indicates the amount of capital, such as land, buildings, machinery, inventories and accounts receivable used in conducting the business of the department.
5. It contains accumulative figures to the first of the current period, covering gains, shrinks, yields, costs, expenses, results, etc.

In short, it is a combined financial, operating and merchandising statement indicating whether a department is operating efficiently or inefficiently from a final results standpoint, and what, if anything needs to be done to bring about improvements.

In financing the average business the following factors, among others, have to be considered:

1. That the stockholders or proprietors invest their money in the capital stock of the company for the purpose of obtaining a fair return on their money invested. The return is represented by dividends paid on the capital stock issued and must be paid out of surplus net profits earned.

2. The bondholders invest their money in bonds issued for the purpose of obtaining interest on the money they loan. Similarly, the holders of current notes payable are entitled to interest for money loaned by them.

3. Surplus indicates the accumulative profits or money retained in the business after—

a. Expenses and costs have been met.
b. Interest has been paid on all borrowed funds.
c. Stockholders have been paid their dividends.

The secret of successful financing from this standpoint is to use the least possible capital consistent with supplying adequate funds with which to properly conduct the business. Idle capital is a burden to business. It produces interest costs and overhead expenses for which no value is received. This emphasizes the importance on the one hand of keeping borrowings down

minimum, keeping cash and bank bal- es as low as possible, etc.; and, on the er hand, of securing the best possible rn on capital employed in accounts, in- tories, fixed properties, etc., by means economical and efficient use of money in- ted in such assets, which, in other words, ans a rapid turnover of all these assets. inancing a business is a responsibility the Treasurer and financial management. king economical and efficient use of ital is a responsibility of executives and ployes in all functions of the business— t is, merchandising, financial and oper- ng. Each plant, each branch and each partment is in reality a separate busi- ss. Each uses its own capital, has its n organization and does its own busi- ss. Therefore, the executive in charge each of these functions and departments a company as a whole should recognize d assume his responsibilities in the prop- use of the total capital employed in such nction and department. He should be ide-awake to the actual conditions and fluences affecting his business, and should ercise the keenest judgment possible in forming himself of future trends and nditions affecting not only business as a hole, but also affecting his own industry nd department of the organization for hich he is held directly responsible.

Educate Department Heads

Granting that it is desirable to give most epartment heads full and complete in- ormation covering detailed and depart- ental costs and financial figures, it is ecessary, first of all, however, to educate hem as to the bases on which these figures re determined, together with their mean- ng, the system used in accounting for the usiness, how to analyze the figures, and nost important of all, how to get direct ction which will correct errors and pro- luce improved results. In the same way hat a balance sheet, or operating statement, neans very little to an inexperienced or ntrained accountant, so also does the de- artmental statement, or any statement of osts mean but little, if anything, to an untrained department head or foreman. This emphasizes the need for organized raining being given, so all executives and department heads will appreciate and make use of the information given to them.

In conclusion, it should be clearly understood:

1. That it is the responsibility of the accountant to deliver adequate and proper financial and cost information and analyses to executives, department heads, or those who are responsible for the various functional activities of a business.
2. That it is the responsibility of the executives and department heads receiving these figures, statistics and analyses to understand and make proper use of them.

In final analysis, this means that both the accountants and the executives of financial, merchandising and operating functions of a business should fully recognize and understand the problems and services of the other, and that there should be hearty co-operation on the part of all parties concerned toward the securement of the best possible final results for the business as a whole.

President Coolidge Halts Senate Quiz of Treasury

(Continued from page 9)

candidate for the Democratic nomination for president on elected delegates thus far, but that does not mean that the New York Governor can or will be nominated at the New York convention. On the contrary, his 186 votes, coupled with the twenty-four for Underwood, simply means that the Democratic "old guard," consisting of Murphy, Brennan and Taggart, have 210 votes in hand to be added to the uninstructed delegates to defeat McAdoo or any other candidate whom they do not want. The Democratic leaders now expect that McAdoo will turn up in the convention with about 360 delegates, to 300 for Smith and Underwood combined, the remaining 300 delegates being uninstructed. Out of this conflict of candidacies, the logical result must be a "dark horse." In the "dark horse" stables, Taggart is carefuly grooming Senator Samuel Ralston who, despite his 67 years of age, is favored by geographical and political considerations and by the fact that he is not especially opposed by any group. Murphy is carefully preparing Senator Copeland as his "dark horse" candidate for either the Presidency or the Vice-Presidency. The McAdoo following would prefer Senator Carter Glass of Virginia or Homer S. Cummings of Connecticut, and might even go so far as to help nominate John W. Davis if a majority of the convention wanted him. Senator Joseph T. Robinson of Iowa is also mentioned, while Henry Ford, although he has the thirty votes of Michigan in his pocket, is rarely spoken of nowadays as a compromise candidate. The New York convention will be the lively party gathering this year.

I. M. A. Directors Oppose the McNary-Haugen Bill

Opposition to the McNary-Haugen Bill now pending in Congress was expressed at the meeting of the Board of Directors of the Illinois Manufacturers' Association on April 11. This Bill places in the hands of the Government the power to buy and dispose of basic agricultural commodities in such a manner as practically to result in price fixation and elimination of private enterprise.

A resolution was adopted by the Directors pointing out that price fixing in the past in the United States and other countries has never resulted in economic gain for the special class expected to be benefited by such price fixation. Objection also was expressed in the resolution to the advance in cost of living and the increased expenses of operation.

The Directors followed the action of the Foreign Trade Committee in favorably recommending for passage by Congress H. R. 6357 for the reorganization and improvement of the foreign service of the United States (introduced by Representative Rogers) and H. R. 4517 to establish in the United States Bureau of Foreign and Domestic Commerce a foreign commerce service of the United States (introduced by Representative Winslow).

Another resolution passed by the Directors requested of the United States Department of Commerce a list of all exporters.

Mack Truck Opens Big New Service Station in Detroit

The Mack-International Motor Truck Corporation has recently opened a new plant for Mack trucks in Detroit that is considered one of the finest and best equipped sales and service stations in the Middle West. The floor space covers an area of 40,000 square feet. The formal opening, as announced by M. H. Anderson, Detroit Branch Manager, was held on April 11, 12 and 13.

The expansion was made necessary due to the tremendous growth of the Mack Company's business in Detroit. The Detroit plant is the distribution center for Michigan as well as the Northwestern part of Ohio, with sub-branches at Saginaw, Flint, Lansing, Grand Rapids, Kalamazoo and Toledo. During 1923 the Detroit district did a business of a little over $1,500,000 in sales alone.

Duty on Canadian Shipments

Manufacturers who are exporting goods to Canada are advised that after April 15, 1924, a special or "dumping" duty on shipments to Canada shall apply, without exemption allowance, under provisions of Section 6 of the Tariff Act, except in respect to goods purchased before April 15, 1924, provided such goods are entered for consumption on or before June 1, 1924.

In the past the special duty or "dumping duty" has not been applied when the difference between the fair market value and the selling price of the goods to the importer in Canada did not exceed 5 per of their fair market value. This 5 per cent leeway is now removed.

The regulation providing that special or "dumping" duty is not to apply on account of any advance in the market value of goods between the time of their purchase by the importer and the date of their exportation to Canada, is not affected by this order.

New Incorporations in U. S.

Incorporation in the United States during March, of companies with $100,000 capital or more, numbered 717, involving the sum of $808,923,700. In 1923 similar incorporations numbered 729 with a combined capital of $500,819,000. Since Jan. 1, 1924, 2,352 concerns have been organized with an authorized capital of $2,348,676,900. During the first three months of 1923 there were 2,318 companies chartered with capital of $2,111,221,100.

TRANSPORTATION

Railroads Need Men With Engineering Degrees and Offer Many of the Best Opportunities for Advancement

RAILROADS offer many of the best opportunities open today to men with engineering degrees, according to James R. Howard, Chairman of the Board of the National Transportation Institute. Scientific progress of railroading demands more and more trained brains, he declares in a report on transportation personnel.

"Fuel engineering has become one of the most important technical departments with the elaboration of the enormous power unit of the locomotive of today," said Mr. Howard. "Radio is installed in a number of trains and will be increasingly used. Automatic train control, although opposed by the railroads on account of the heavy expense involved, has been ordered by the Interstate Commerce Commission to be installed on full passenger divisions of forty-nine railroads. It will call for supervision and operation by a large body of trained experts.

"The railroads are short of technically educated men able to supervise. How the requirements have shifted over to the side of expert direction is shown by the fact that the railroads have tripled their output in ton miles in twenty years but are using fewer than twice as many men. Scientific progress is shown by the increase in tractive power of American locomotives which this year averages 37,000 tons, an increase of 16,000 tons since 1903.

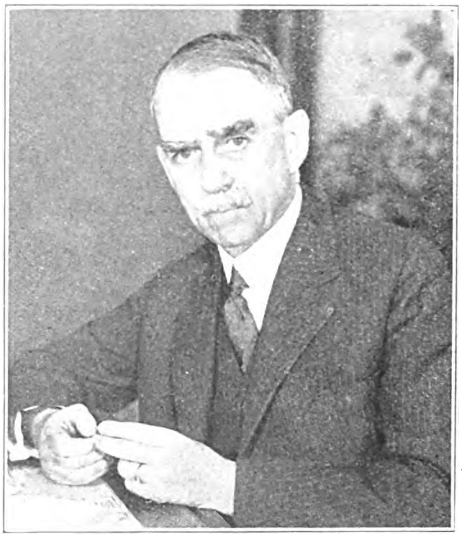
"Railroad mechanical and operating departments require works managers, shop superintendents, road and yard foremen of engines, traveling engineers, fuel and signal engineers, and superintendents of operation—to mention only a few, virtually all of whom need engineering degrees. These positions lead directly to the top. For some reason young technical graduates have been shy of railroading. Railroads need them now and the opportunities for advancement were never so good."

Crowley Heads New York Central

Sixty years ago, on a farm near Cattaraugus, N. Y., was born a lad who as a small boy secured a position with the Erie Railroad as messenger. A few days ago that same lad was elected President of the New York Central Lines at a salary said to be $100,000 a year. His name is Patrick E. Crowley, and he was chosen to succeed the late A. H. Smith, who was killed by a fall from his horse while riding in Central Park, New York City.

Prior to his election to the Presidency of the road, Mr. Crowley was Vice-President in charge of operations for the New York Central, the Ottawa & New York, the Adirondack & St. Lawrence, the Raquette Lake, the Fulton Chain, the Toledo & Ohio Central, the Kanawha & Michigan, the Kanawha & West Virginia, and the Zanesville & Western Railways.

Selection of Mr. Crowley puts at the head of the System a man of the type of Mr. Smith, one of the operating geniuses of the country. The choice also is in the line with the policy of the Directors to leave the Company's financial management to the Chairman of the Board and actual operation of the road's vast transportation system in the hands of the President.



P. & A. Photo

PATRICK E. CROWLEY

New President of New York Central R. R., Regarded as One of the Ablest Operating Heads in U. S.

Starting with the New York Central in 1889, Mr. Crowley rose from train master to vice-president in 1915, through the positions of division superintendent, general superintendent, assistant general manager and general manager of the road.

Albert H. Harris, who had been prominently mentioned for the Presidency, was elected Chairman of the Finance Committee. He will retain charge of the road's finances and of its corporate relations. George A. Harwood was appointed Vice-President in charge of improvements and developments. Raymond D. Starbuck was named Vice-President in charge of operations, the post which had been held by Mr. Crowley.

Discuss Grade Crossing Deaths

Elimination of grade-crossing accidents will be discussed by railroad executives, public safety commission members and automobile club representatives at a conference in Chicago April 30 and May 1, H. G. Taylor, President of the National Association of Railroad and Utility Commissioners, announces. Addresses by A. W. Whitney of the National Bureau of Casualties; N. H. Loomis, General Solicitor for the Union Pacific; W. L. B. Aleny, Chairman of the Pennsylvania Public Service Commission; Frank Milholland, President of the North Dakota Board of Railway Commissioners; H. A. Rowe, Chairman of the Safety Section of the American Railway Association, and Frank E. Jack, President of the Chicago Motor Club, are on the program.

Big Business in February

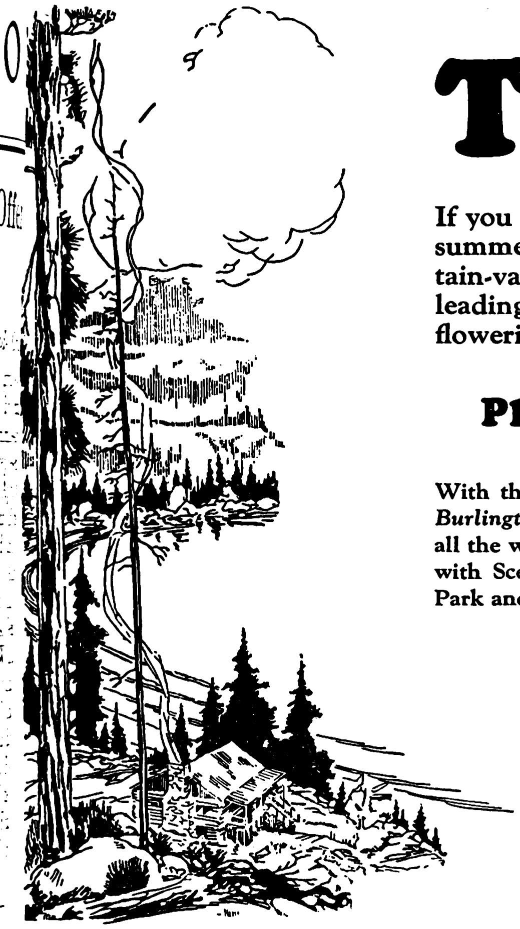
The Class I railroads of the United States enjoyed one of the most prosperous months in recent years in February, according to earnings figures made public by the Bureau of Railway Economics. These figures show that the carriers had an aggregate net operating income of $71,191.600, the equivalent of an annual rate of return on their tentative valuation of 6.28 per cent.

Operating revenues of the railroads for February, 1924, amounted to $478,914,250, an increase of $31,965,380, or 7.2 per cent, over a year ago. Operating expenses totaled $374,699,900, a decrease of $1,306,700, or .3 per cent under those for the same month last year.

For the first two months of 1924 the carriers had a net operating income of $122,485,200, equal to a return on their tentative valuation of 5.32 per cent. This compares with an aggregate net operating income for the corresponding period a year ago of $100,461,250, or 4.70 per cent.

Omaha Merger Soon, Says Finley

Complete merger of the Omaha and Northwestern Railroads, resulting in new economies of operation and an altered personnel, may be effected in the not distant future and in advance of realization of the Interstate Commerce Commission's suggested plan of general consolidation, William H. Finley, President of both railroads, said recently. Mr. Finley, Chauncey M. Depew of New York, Harold S. Vanderbilt of Boston and E. S. Woodworth of Minneapolis were re-elected directors at the annual stockholders' meeting in St. Paul.



The Rockies!

If you are a normal person the very term will call to mind care-free summer days amid the wild, exhilarating beauty of this greatest mountain-vacationland—days spent on horseback or afoot over wonder trails leading up to the high places, or motoring, fishing, golfing and wild-flowering in sunny, green valleys.

Plan now to enjoy it all this summer

With through trains from Chicago and St. Louis, equipped and operated in true *Burlington* fashion, the *Burlington Route* serves the whole Rocky Mountain Region all the way from Pikes Peak to the Canadian Boundary and on out to Puget Sound, with Scenic Colorado, Rocky Mountain National Park, Yellowstone Park, Glacier Park and the great new cities of the pacific Northwest on the way.

Interesting booklets—material for many a pleasant evening of "planning"—yours for the asking

ILLINOIS NORTHERN RAILWAY
AND CONNECTIONS

Manufacturing Locations for Sale

Along the lines of the Illinois Northern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Illinois Northern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

For complete information, including rates for transportation and prices of land, apply to

SALES MANAGEMENT

"Do" and "Don't" Suggestions to Become a Successful Salesman; "To Sell is to Think,—and Think Always"

By WILLIAM HAYHURST
Field Secretary,
Illinois Manufacturers' Association

THE author of this article is a salesman and organizer of national prominence. He organized the Coal Consumers League of Massachusetts in 1914 and represented the Allied Governments, during the late war, in the purchase of materials in 1916. In 1916 he was District Manager for the Mississippi Valley Association in Memphis, and has served the Illinois Manufacturers' Association as Field Secretary for the past four years.

THE successful salesman of today must be a well-read, forceful, honest, polished man, who can meet intelligent dealers on the basis of assisting them increase their annual business. "Ways 1 means salesmen," or those with the ative force, are those whose services are nestly sought for today.

The colorless salesman is a failure; he es not even shed the light of his palees. At best he is but a reflector, and ere is little warmth in reflected rays. ere is nothing direct or positive about n. He is like a water-logged ship witht a rudder, a captain, and a crew. He nply floats upon the sea of life, and even rocks of trade have too much self-reect to assist in wrecking him. He is too all for disaster to notice.

The great salesman must be a student men, and until human nature changes, is will constantly excite his mind, for ch day he will come in contact with a sposition new to him, and to succeed he ust be trained in the art of diplomacy, r each and every case differs in some spects. Shakespeare once said, "To ine own self be true," but there is more an that in a successful salesman.

He must be thorough. Do not be content ith surface service, apparently doing the sk that has been set you,—for this is not fficient. Do it in such a way that you ow it cannot be done better,—that is ing thorough. If you have received inructions how to perform a certain task, deavor to find a better way than you have een told; always be thinking of better ays and better means of carrying out your aily work. This is the cult of thoroughess, and will be one of the strongest facrs in your business success.

A pleasant smile, a kindly manner, will ften win where sterner methods fail. It is ood for each individual to cultivate this ttribute, for it is one of those that, in ractice, brings as much gratification to hose who acquire it as to those who enjoy ts influence.

Then, again, personality is an influence xercised by one individual over his felow creatures. It is difficult to define, yet t is easily felt. It is the effect upon our ninds of an individuality that attracts, and xercises an indescribable influence.

To keep out of the rut he must do the nusual thing. He must strive for origiality. There are a thousand and one diferences of this kind between the unusual nan and the good routine man; the salesman who successfully strives to lift himself above the ordinary and to keep himself out of the rut, will reap the resulting benefit.

Do not be afraid of not receiving the respect due you. Better find out whether or not you deserve any respect. If you are worth it you are likely to get it some time. Do not be jealous of yourself. You are having no worse a time, probably, than the experience of the thousands who are with you and above you. Our lives are much alike, so far as business goes. We have to go through a certain amount of training and stumble and fall a number of times. All this is discouraging, and we are prone to envy the fellow ahead and to pull at the rein, forgetting that the driver may have had a harder time than we are having while between the shafts of labor.

Be considerate of the customer. He may be in a more difficult position than you are. At times he is puzzled and uncertain. If you put yourself in his place, perhaps you would show more irritability and indecision. *Irritability felt* interferes with good salesmanship; *irritability shown* is fatal to good salesmanship.

Do not try to be smart; do not attempt to be peculiar; do not be radically different from others, unless you are in perfect control of these attributes and know how to distribute them. There is safety in the middle of the road. There is danger at the sides, and there is chance for disaster beyond the boundary line. The great salesman, like the great business man, wins by taking reasonable chances, but it is not safe for you to copy him in entirety. He has succeeded by the exercise of his enormous ability and remarkable personality. He is a genius. To him license is given.

One of the greatest failures of our salesmen today is taking the chance to sell at the "wicket" instead of inside the office. Do not outline your proposition until you get the proper time and place.

I believe, with all sincerity, that if a salesman will stick to the essentials, he cannot help being a success. Advertising, of course, has regenerated salesmanship, but has not minimized the importance of the selling department.

In conclusion, I would like to relate an incident that happened in Alabama several years ago. Watching intently the manufacture of sorghum molasses by the old-fashioned method of driving the mule with a beam to its back, I saw a big "cullud gemmon" sitting on the fence, with apparently not a care in the world. I said to him, "Rastus, what do you people do round here for a living," and he replied, "Oh Boss, sometimes we sit around and think, and sometimes we just sit around." I left him, but he gave me much food for thought. I said to myself, "There are a whole lot of white people just the same as Rastus; sometimes we sit around and think, and sometimes we don't even think—just sit around."

The moral is: To *sell* is to *think*, and *think* always.

U. S. Chamber of Commerce Meets in Cleveland May 6

Outstanding manufacturing problems will be considered at the annual meeting of the Chamber of Commerce of the United States to be held at Cleveland, May 6 to 8. A special group meeting of leading manufacturers from all over the country is scheduled for the opening day of the convention, under the auspices of the Chamber's Department of Manufacture, of which E. W. McCullough is manager.

This special group meeting will be devoted almost entirely to problems of particular interest to manufacturers. Discussion of the three major topics of the convention, "Business and Agriculture," "European Readjustment," and "The Responsibility and Integrity of Business" will take place in the general sessions.

The preliminary program for this group session, which has just been announced, includes the following subjects: "The Obligations of Employer and Workers in Successful Production," "The Simplification of the Government's Purchases," and "Industrial Pensions or the Care of Faithful Workers."

FOREIGN TRADE

Annual Survey of "Invisible Trade" by Department of Commerce Shows U. S. 1923 Net Balance Is $389,000,000

THE Department of Commerce has with the co-operation of the various government agencies, banking and other interests, completed its annual survey of "invisible trade for 1923." The following is a brief summary of the survey:

"In any analysis of our foreign trade balance sheet it is essential to take into account many items not appearing in the customs returns. Those items, currently styled "invisible exchange," are of such increasing importance in any sound conclusion as to the movement of our foreign trade that they require comprehensive study by all whose interest lies in these subjects.

"The results of the study might be formulated in many different fashions.

"We exported $1,208,000,000 of goods; we imported $3,819,000,000 of goods. There was thus a balance in our favor on the movement of goods of $389,000,000.

"Parallel with this movement of actual commodities were the 'current invisible items,' in which we paid out in foreign countries through our tourists, remittances of immigrants, payment for foreign shipping and various services, a total estimated at $1,162,000,000. On the other hand we received estimated interest on monies owed us by foreign investors and foreign governments, together with payments for the use of our ships by foreigners and by expenditure of foreigners in the United States, approximately $792,000,000. Therefore, on these items of current invisible exchange we had a net balance against us estimated at $370,000,000.

"Thus, if at this point we deduct the favorable balance which we received on our merchandise business, we find that our favorable balance is reduced to approximately $19,000,000.

"During the year there were large movements of capital. Foreigners apparently bought $394,000,000 of our securities and $50,000,000 of our currency, and paid $91,000,000 on debts due to our Government, or an estimated total of $535,000,000. On the other hand, our citizens bought foreign securities estimated at $410,000,000. In other words, the net interchanges of capital show that we received an estimated $125,000,000 more than we placed abroad.

"In precious metals we exported $101,000,000 and we imported $397,000,000, or we received a net balance of $296,000,000 in gold and silver.

" It might be stated that this gold shipment to us served to settle the $19,000,000 owing us on the balance of goods and current invisible items as above, together with the estimated balance of $125,000,000 net excess of investment here, leaving a balance of $152,000,000 which may be attributed to discharge of previous open bank and merchants' debts to us."

Industry Exhibit in Holland

From July 18 to August 18, 1924, a exhibition of commerce and industry wil be held in Tilburg, Holland. It intends t be a manifestation of Netherlands manu facturers and tradesmen, and also to gi to foreign countries the opportunity to sho their best products. Tilburg is a center the industrial district of the South of th Netherlands.

Sample Fair in Italy

Notice has been received by the Depar ment of Commerce that the Sixth Intern tional Sample Fair will be held at Padu Italy, from June 5-19, 1924, The ge graphical location of Padua makes it center for large participation of the cou tries of Central and Eastern Europe. Th organizing committee has extended invit tions to visitors and participants.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

AUSTRIA—9857, asphalt; caustic soda; chromate of potassium; 9895, cotton rags, old and new; 9810, motion picture films; 9857, pitch; 9854, plasters, adhesive; 9857, rosin; 9854, surgical dressings; 9857, sodium chromate; 9815, tobacco cutting machinery, automatic; 9863, tinplate; 9815, tobacco weighing and packing machines; 9857, stearine; 9846, flour, patent, in monthly shipments of 200 to 400 tons.

AZORES—9829, anhydrous ammonia; ice-making plant, small; motors, electric; machinery for kiln dry of wood; machine tools; nail-making machinery; varnishes.

BELGIUM—9849, glycerin, crude; 9812, match-making machinery; match box-making machinery; 9849, oils and tallows.

BRAZIL—9823, baking machinery; industrial machinery; refrigerating machinery and apparatus; well-drilling machinery.

CANADA—9803, candy manufacturing machinery, automatic; kettles, copper; marble cooler slabs for confectionery; tools, confectionery; 9838, molasses, raw, 3,000 tons in each shipment.

CHINA—9825, nail-making machinery and equipment; wire-drawing machinery.

COLOMBIA—9867, machinery for making tin cans for butter; machinery for packing butter in cans; tin can parts for use in packing butter; 9813, weaving and spinning fiber for coffee bags.

CZECHOSLOVAKIA—9801, machinery for making paper clips.

DENMARK—9889, vulcanizing rubber in sheets.

EAST AFRICA—9862, iron sheets, corrugated, galvanized, 10 tons monthly.

EGYPT—9850, corn flour, 150 to 200 tons monthly; 9844, flour; 9852, flour; 9885, flour; 9841, flour in large quantities; 9881, Southern yellow pine.

ENGLAND—9799, glass pots, opal, with and without caps.

ESTHONIA—9802, sporting goods.

GERMANY—9844, coffee; cocoa; chocolate; fruits—dried, canned, and preserved; lard; 9882, Douglas fir; 9885, logs; lumber; 9879, logs; lumber 9843, milk, evaporated; 9844, milk, evaporated; rice; sugar; 9866, steel, all kinds; tools, pneumatic; 9873, tanning extracts, especially chestnut bark; 9885, timber.

IRELAND—9851, flour, 100-ton consignments; 9886, hardwoods; 9832, radio apparatus, cabinet and open, 2, 3 and 4 tube; 9886, southern yellow pine; Sitka spruce.

JAPAN—9826, stone-cutting machinery.

LATVIA—9802, arms and ammunition, sporting; 9830, radio apparatus and parts.

MEXICO—9874, automobiles, low-priced; 9804, chromolithographs, all unframed; 9827, conveyors, ore, 300 feet long, and transmission belt; 9818, engines, producer gas, complete; 9839, foodstuffs—canned and dried; 9827, grinder, zinc, to grind fine, one ton per hour; 9839, general merchandise; 9806, glass and mirrors for photographer's use; 9822, hat press for making Mexican straw hats; 9831, light plants and batteries, electric, for farms; 9827, motors, electric, 10-horsepower, 220-volt, A. C., 60-cycle, 3-phase; 9896, oilcloth, cheap; 9804, paintings—religious, landscape, and historical; 9804, phonograph records; 9806, photographic paper; 9805, parts for making photographs on buttons; 9808, scales, railway and platform; 9822, weaving machinery for heavy fiber for making sacks; 9839, paper.

NEWFOUNDLAND—9821, road repairing machinery, steam, crusher and elevator, road truck, and truck loader.

POLAND—9819, bakery and flour mill equipment; 9820, machine tools, metal working; 9811, sporting goods; 9865, tiles for sewers, floors, walls, and stoves.

SALVADOR—9816, boats, tow; engines, marine; ice-making machinery; nets, fish, and accessories.

SOUTH AFRICA—9836, clover, seed, hubam.

SWEDEN—9858, enamels and varnishes, first quality, for automobiles.

SYRIA—9855, chemicals used in dyeing processes; dyeing machinery, modern; dyes, aniline.

URUGUAY—9870, burlap bagging.

A New Band—

Paul Whiteman's "Collegians," A. Vincent Gauthier, Conducting

in the Grill Room

THIS famous band, a regular Paul Whiteman unit, comes to the Congress from New York, where it has played numerous long and successful engagements. You may enjoy these artists of syncopation daily at luncheon, dinner and supper dance.

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

AUTOMOBILE—AVIATION

THE automobile industry and automobile owners consume 50 per cent of the asbestos products manufactured in the United States. Asbestos in one form or another is used in a dozen or more parts of the present highly developed motor car, but its principal use is in the manufacture of brake linings. It is estimated that the annual consumption of asbestos brake lining is 70,000,000 feet, of which 15,000,000 feet is in new cars and 55,000,000 feet in the replacement market.

It is only within the last fifty years that asbestos products have been manufactured on a commercial scale. The United States holds first place in their manufacture, yet it produces only 1 per cent of the total world output of raw asbestos. More than nine-tenths of the asbestos consumed in this country is imported. Nearly the whole amount comes from Canada, although considerable quantities also come from South Africa. The major asbestos-producing countries are not important manufacturing countries.

Motor Output for Quarter, 1,040,755

Production of motor vehicles for the first quarter of 1924 totaled 1,040,755, which is the largest output on record for this period of the year. Each month exceeded the corresponding month in 1923, and the three months' total was 19 per cent above the first quarter a year ago. The March figures as reported to the directors' meeting of the National Automobile Chamber of Commerce at New York, total 356,509, slightly more than March of last year, and a 2½ per cent drop from February of this year.

Air Pressure in Balloon Tires

With the increasing popularity of balloon tires has arisen the necessity for revised inflation pressures. And with new inflation pressures has come an added necessity for closer check on this important phase of tire life.

It is obvious that with no decrease in load per wheel on a car and with greatly lessened air pressure, the motorist must not permit the air pressure to vary to any great extent.

If 10 pounds of air escapes from a high pressure tire, for which the manufacturer recommended an inflation of 60 pounds, for example, there is a loss of 16 2-3 per cent or one-sixth of the entire amount of air. On the other hand, a loss of 10 pounds of air from a balloon tire for which the recommended inflation is only 30 pounds, means a loss of 33 1-3 per cent or one-third of the entire quantity.

Inasmuch as any tire is built to withstand all reasonable road shocks at certain recommended pressures, it naturally follows that the resistance is lessened with any variation from recommended inflation pressures.

Busses Curb Taxis in Chile

The rapid expansion in autobus service in Chile has materially affected the operation of taxicabs, says the Department of Commerce. Although two years ago, the motorbus was practically unknown in Santiago, Chile, the number of busses now registered in the local license office is 419, and of this number 378 are American made. The popularity of busses is forcing the owners of "for hire" automobiles to place their business on a competitive basis or withdraw their machines, and in their efforts to accomplish the former, they have petitioned for the authorization of a standard schedule of fares based on distance and the approval of the use of taxi-meters. As there are practically no meters available at this time the use of these recording devices is optional, but there is every likelihood that when meters can be obtained in quantity their use will be made obligatory.

American Autos in Ceylon

American motor vehicles have affected the railway traffic in Ceylon considerably, says the Department of Commerce. It is reported that at one station where the daily receipts were 700 rupees a year ago, they amount to only 300 rupees at present, and the Government is seriously considering the advisability of expediting the Aberdeen-Laxapana hydro-electric scheme and constructing electric railways. Competition to the densely populated districts of Colombo has also increased. More than 1,200 automobiles and trucks entered Colombo during 1923 for the Island's local trade, with a valuation of approximately $1,100,000. Up to Nov. 31 the United States had furnished 1,004 of the number, valued at $728,890; Great Britain, 109, valued at $146,660; France, 74, worth $65,460; and Italy, 10, at $13,372.

Most Franklins Still in Service

According to an investigation recently made by the Franklin Automobile Company, 75 per cent of all Franklins made since the Company turned out its first car in 1902 are still in service. "This," says Sales Manager S. E. Ackerman, "is a record calling for little further comment. Certainly the figures prove that Franklins are built to last. Instances of Franklin cars which have gone 100,000 miles or more are so common as to excite little attention, and a recent investigation disclosed numerous instances of Franklins which have chalked up 200,000, 300,000 and even as high as 500,000 miles."

What Are You Looking For From a Printer and Binder?

Equipment The necessary modern efficient machinery and buildings to economically and speedily produce the printing and binding required.

Personnel An organization of thoroughly trained men and women to operate the plant and deliver according to agreement, both as to time and quality.

Experience Forty-six years of active continuous operation under the same name and management.

Our advice is to place your printing and binding with a firm that you know has these qualifications.

Your inquiries will be given our utmost care and attention.

*"The Field of Investment"—Last of Ten Important Sources of Capital Which Provide Funds for Banking

By C. W. SILLS

Vice-President, Halsey, Stuart & Company, Chicago

V

SEVENTH, fraternal orders.—Partaking largely of the nature of insurance companies are the numerous fraternal organizations in the country whose memberships run into the hundreds of thousands. These fraternal organizations are groups of men and women banded together for a common purpose, in some cases religious; although the common idea back of them all is the protective feature. so that they are, to a large extent. mutual insurance companies. In order to function properly these organizations accumulate reserves which must be invested to be useful. The *Insurance Year Book* reports for the year 1922. 245 fraternal orders with total assets of $340.085.532; total annual income was $197,662.536 which. less disbursements. left $46.073.377 available for investment and reserves.

EIGHTH, eleemosynary institutions and trade unions.—Another source of capital is endowed institutions. such as charities. churches. colleges. etc.. which have large funds invested. the insurance on which largely furnishes their working capital and running expenses. Likewise the trade unions many of which are powerful institutions with hundreds of thousands of members who pay in a certain amount each year for strike insurance, etc. These sums. when not actually being used for these purposes. are invested in securities. directly through the purchase of securities or indirectly through their deposits in banks which. in turn. invest these funds by means of making loans or by purchase of securities.

NINTH, estates and trust funds.—Estates and trust funds likewise yield huge sums for investment. These sums are held in trust by trust companies and individuals and must be profitably employed for the benefit of the legatee or trust. The investment of these funds aims to establish not only a safe, but a permanent income and the securities, if securities are purchased. are generally long term credits advanced for fixed capital purposes.

TENTH, building and loan associations. —Building and loan associations, as cooperative institutions, incorporated for the purpose of enabling their members to purchase or to build homes, furnish, in a unique fashion, a considerable supply of capital to the building industry. The Comptroller of the Currency reports for the year 1923, a total of 10,009 such organizations in the United States with assets of $3,342,530.000 and a membership of 6,864,144 individuals. It is interesting to note that 1923 showed an increase over 1922 of more than 1.000.000 in membership and almost $500.000.000 in assets.

(To be continued)

Bank Failures Decline

Both as to number and liabilities, banking failures in the United States, as reported by R. G. Dun & Co., for the first quarter of this year show a considerable reduction from those of the fourth quarter of 1923. but largely exceed the totals for the first quarter of last year. Thus, such suspensions in the three months recently ended numbered 265 and had liabilities of $100.275.600. as against 365 for $130.693.198 in the fourth quarter of 1923 and only 65 for $12,052.023 in the first quarter of that year. Two sections of the country—the Central Western and the Western—supplied 78 per cent of the banking failures this year, and the same groups of States accounted for 88 per cent of the aggregate indebtedness.

Form Japanese Trust Co.

The Mitsui interests of Japan have organized the Mitsui Shintaku Kabushiki Kaisha, or Mitsui Trust Company, Ltd., which commenced operations in March. The capital is reported as 30,000,000 yen, in 30,000 shares of 100 yen each. One-half of the stock is to be subscribed by the Mitsui Gomei Kaisha, or holding company of the combined Mitsui interests. The other half will be taken by subsidiary companies and individuals connected therewith, no shares being offered the general public.

The functions of the new company are the ordinary fiduciary acts provided by the trust law of Japan, such as the holding in trust for individuals or corporations of money, securities, claims or debts, moveable property, real estate, land leases, trust deeds, etc.

South African Gold Production

Gold production in South Africa in 1923 reached the total of 9,133,060 ounces, an increase of 2,112,950 ounces, or 31 per cent, over 1922. This mark has been exceeded only once in the history of the mines—in 1916, when the output was 9,296,618 ounces. In 1923 the declared value was £40,178,170, which represents an increase of £8.799,607 over 1922. The 1923 total value has been exceeded twice before—in 1920, when it amounted to £44,705,384, and in 1921, when it was £42,520,396.

No Branches for National Banks

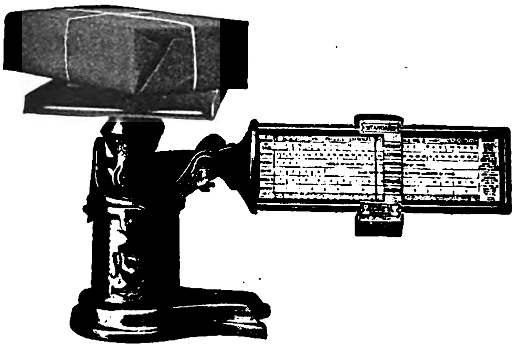
The power of a state to enforce state legislation prohibiting National banks from establishing branches, unless such authority is expressly conferred by Congress, is upheld by the United States Supreme Court in a recent decision. The Court's conclusions were given in the proceedings brought by the First National Bank in St. Louis against the State of Missouri. The case reached the United States Supreme Court on an appeal from the Supreme Court of Missouri, which held that National banks could not, under the laws of that state, open branch banks in the state.

Chile Now Has Income Tax

The outstanding event of the month just closed in the economic life of Chile was the passage and the putting into effect of the income tax law as of Jan. 1, says the Commerce Department. This law marks a new departure in the tax system of Chile and its passage has been under serious discussion in the Chilean Congress for many years. The President closed the special session of Congress, which was called to consider various financial measures, but sittings were resumed later in the month.

"Standard" Postal Scale

With Adjustable Beam and Interchangeable Dial



Made in Two Sizes

No. 2 "Standard" Capacity 2 pounds
No. 4 "Standard" Capacity 4 pounds

A fine wire on the sliding poise indicates the cost in cents on all different classes of mail matter.

The beam can be instantly turned by the hand to any angle, so that the dial can be read from any position.

In case the postal rates should change at any time, a new enameled dial can be mailed and inserted by anyone. This insures a perpetual scale. Warranted accurate.

U. S. Public Votes Heavily for Bok Peace Winner Plan

Balloting by the public on the winning plan adopted by American Peace Award, founded by Edward M. Bok, has closed and the total number of votes received was 610,558. Of these 534,177 were in favor of the plan chosen by the Jury of Award, of which Elihu Root was Chairman, while 76,381 voted against it. The percentages were 87½ in favor and 12½ opposed.

Every state in the Union is represented in the vote, as are also the Virgin Islands, Hawaii, Alaska, Porto Rico, etc. Ballots have been received from American citizens in China, Egypt, Czechoslovakia, Syria, Germany, Japan, Greece, Russia, Uruguay, Australia—and other of the British possessions, as well as from the British Isles—Roumania, Netherlands, France, Italy, Helvetia and many other countries.

The Policy Committee has arranged to publish in book form the complete text of the winning plan and nineteen others, representing all types of proposals, some by eminent students and writers on international subjects, including three former college presidents, a research chemist, a mining engineer, a bishop, three professors of international law, the Vice-Chairman of the U. S. Tariff Commission, etc. The book, "Ways of Peace," will be published by Charles Scribner's Sons.

In the introduction to the book, Miss Esther Everett Lape, Member in Charge for the Policy Committee, states:

"The American Peace Award has been engaged in no 'propaganda' for any one cause or any one 'plan.' It represents, perhaps, 'propaganda' for information. In the plans here published, in the winning plan, and in the thousands of other plans prepared and submitted, it has set in motion far-reaching currents of ideas and opinions. It has been the means of extending understanding of the ways to peace, and in so doing needs no apology, no justification, and no defense. In this growth of popular understanding, there is the surest indication that at some not very distant date the United States will choose one of these ways."

Supreme Court of Illinois Upholds I. M. M. C. A. Case

On April 14 the Illinois Supreme Court reversed the judgments of the lower courts in Butler Street Foundry & Iron Company vs. Illinois Manufacturers' Mutual Casualty Association Inc. The case involved the question of liability under a public liability clause for an accident to members of the public away from the plant of the insured, and caused by the use of a motor truck.

The decision of the Supreme Court Completely agreed with the position taken by the Illinois Manufacturers' Mutual Casualty Association Inc., in refusing to pay the claim against it, and held: "There is not the slightest ambiguity in the language of this policy insofar as it is involved in this litigation, and so there is no room for construction * * *. The policy did not cover the accident in question, and the motion of plaintiff in error to direct a verdict in its favor should have been allowed."

Iron and Steel Export

Over one-half of the iron and steel shipments of the United States for the entire year 1923 went to the main American markets, Canada, with 760,400 tons, being far in advance of any other export field, according to the Iron and Steel Division of the Department of Commerce. Cuba took 171,990 tons; Mexico, 84,600 tons; Argentina, 53,700 tons; Brazil, 50,500 tons; Chile, 33,900 tons. The United Kingdom took 63,000 tons of iron and steel from producers in the United States. Exports to Japan increased heavily during the last quarter, due in part to needs for reconstruction after the earthquake. Japan's total for the year was 360,000 tons, of which 160,000 tons were shipped during October, November, and December. Shipments to Australia, the Philippine Islands, and China were 41,100 tons, 35,000 tons, and 52,100 tons, respectively.

Canadian Sales Tax Reduced

The Canadian sales tax has been reduced from 6 to 5 per cent. On agricultural implements the reduction amounts to from 20 to 50 per cent, to satisfy Western Canadian farmers.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

NERAL Manager Armstrong of the Hattiesburg (Mississippi) Traction pany figures the utility properties of United States represent $15,000,000,- or a per capita investment of $136 for man, woman and child in the country. his is four times the amount invested in steel industry, eight times the amount sted in the automobile industry, and times the capital put into the packing istry.

tility values are divided as follows: tric, $4,800,000,000; electric railways, 00,000,000; gas companies, $3,700,- ,000; telephone, $2,000,000,000.

t takes an average of $5 investment in nt equipment to produce $1 worth of ss revenue from the sale of service— y few businesses are conducted on such mall turnover.

Officers of Utility Associations

Officers who will direct the destinies of Illinois State Electric, Illinois Gas and inois Electric Railway Associations dur- the ensuing year were elected at the sing session of the recent joint conven- n of the organizations at Chicago. They e:

Electric Association — President — Bert Peck, Illinois Power and Light Corpor- ion, East St. Louis; Vice-President—J. ul Clayton, Central Illinois Public Serv- Company, Springfield.

Gas Association—President—John G. arned, Public Service Company of North- n Illinois, Chicago; Vice-President—R. Chew, Union Gas and Electric Company, loomington.

Electric Railway Association—President R. A. Moore, Aurora, Plainfield and liet Railway Co., Joliet; First Vice-Pres- lent—J. F. Egolf, Aurora, Elgin & Fox iver Electric Co., Aurora; Second Vice- resident—C. F. Handshy, Illinois Trac- on System, Springfield.

R. V. Prather of Springfield was re- lected Secretary-Treasurer of the three ssociations.

1,000,000 Phones in Illinois

The one-millionth telephone station of he Illinois Bell Telephone Company in the tate was installed at Peoria on March 5 by the Company. It was placed in the ome of Joseph Jochman, 715 Idaho Street, switchman employed by the Chicago, urlington & Quincy Railway.

Mr. and Mrs. Jochman and their son were guests of honor at a dinner at the reve Couer Club that evening, given by eorge C. Treadway, District Commercial Manager for the Telephone Company. Other guests of honor were Mr. and Mrs. W. S. Reyburn. Mr. Reyburn was Manager of Peoria's first telephone exchange and installed the first telephone in that city on May 15, 1879. His first exchange had only 36 subscribers. Peoria now has 21,175 telephones.

7 Eye-Saving Rules

A glass-eye may look all right but it doesn't mean anything—there's no substitute for wornout eyesight. With this in mind the American Society of Safety Engineers and the National Safety Council recently evolved the following rules for the use and arrangement of electric lights:

1. Light should shine on the object under gaze, not in the observer's eyes.
2. Glare, which is light out of place, can be overcome by the use of diffusing glass globes, reflectors or shades.
3. Strong contrasts of light and shadow should be avoided. Indirect lighting is to be preferred, by means of which the brightness of lighting bowls or other fixtures is reduced.
4. Avoid the glare of reflections from polished surfaces.
5. Localized lighting, in the form of drop lights, etc., is to be avoided. It produces too sharp contrasts of light and shadow.
6. Both too much and too little light strains and fatigues the eyes, which must labor to obtain sharp definition of the object under gaze.
7. Eye-strain and irritation result from the use of unsteady, flickering or streaked light sources.

"Moving Day" for Phone Co.

What the demand for installations means even to a single telephone company in a single state is shown by a recent survey of the three Ohio cities of Cleveland, Dayton and Columbus, made by the Ohio Bell Telephone Company. This survey disclosed that the service of the average Cleveland user is disconnected every twenty-seven months. For the five-year period ending with December, 1921, there were 304,674 disconnections for less than 140,000 subscribers. The telephone of the average subscriber in Dayton, the statistics showed, is changed every twenty months. In Columbus, the Bell engineers found that 42 per cent of new subscribers quit within a year, 63 per cent within two years, while 9 per cent used their telephones less than three months. When it is considered, in addition, that the average Ohio family moves every twenty-five months, the problems presented to the telephone company by "moving day" are self-evident.

What is true in Ohio is true elsewhere, and it has been estimated that the cost to the Bell Telephone System as a whole for installing and removing telephones is $20,000,000 annually.

What an Ounce of Gold Does

One ounce of gold pays wages for twenty hours work in the United States; fifty hours work in Great Britain; ninety hours work in Japan; 100 hours in France and 200 hours work in Germany.

A Station on The Voice Highway

JUST as our railroads form a great system and a traveler boarding a train at any station may travel to any other, so the Bell System combines the telephones of the nation and every Bell Telephone is a station from which every other Bell Telephone may be reached.

"Station-to-station" long distance calls meet almost every requirement and the day rates are about 20% lower than for "person-to-person calls. Evening rates are about 50% and night rates 75% lower than day rates for "station-to-station" calls, but no rate is reduced below 25 cents. Consult the telephone directory for further details or call "Long Distance."

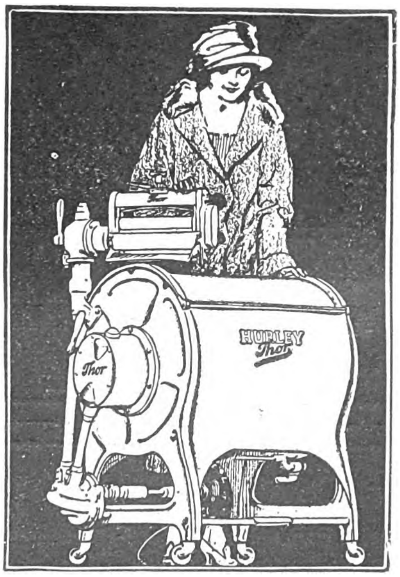
Safety Devices Corporation, Grand Rapids, $10,000; to manufacture and sell check protectors. Irving J. Bissell, 228 Morris Ave., S. E., Gd. Rapids, Lloyd L. Hook, Clara O. Bissell.



Clothes washed by Thor last longer

Thor laundered clothes wear longer and appear fresher. When washed in dubious surroundings and handled by uninterested strangers they do not receive the care which gives them long life. A Thor in the home saves you many dollars and your wife many hours. It keeps your clothing free from contact with other washings and does away with expensive replacements of lost garments. Thor launders for you quickly, economically and efficiently. See it in operation today—you'll understand its superiority.

American Ships for Americans

INVESTIGATE what U. S. Government vessels now have to offer. Every prospective shipper or traveller should know of the advantages of the U. S. Shipping Board vessels — should know why the American Merchant Marine is now a triumphant reality; why seasoned and experienced travellers recommend American ships.

The U. S. Government express freight and passenger ships are operated under four great services. The United States Lines from New York to Europe, the Munson Line from New York to South America, the Admiral Oriental Line from Seattle over "The Short Route to the Orient," the Pacific Mail Steamship Co., from San Francisco over "The Sunshine Belt to the Orient."

In addition to these combination freight and passenger services, Government freight vessels are operated between the principal ports of the world and all the larger ports of the United States.

Investigate American ships first. Send in the information blank below for full description of the various services. Write today.

UNITED STATES SHIPPING BOARD

INFORMATION DEPT. 4315
WASHINGTON, D. C.

Write Today

Send the blank below today for complete information regarding your Government's steamship service to all parts of the world. In every case agents and operators of the ships are companies of long experience and wide repute. In every service the ships are new or entirely reconditioned.

Manufacturers News is published every Saturday by Glenn & Company, 231 So. La Salle St., Chicago, Illinois. Subscription price $4.00 a year; 15 cents a copy. Entered as second class matter March 4, 1912, at the Post Office at Chicago, Ill., under act of March 3, 1879.

$86 low fares to the West

You can go from Chicago to the Pacific Coast this summer on "*The Milwaukee*" for only $86—any time between May 15 and September 30 with final return limit October 31.

You will see the West at its best—wheat country, cattle ranches, mining centers, mountains, Seattle, Tacoma, Mt. Rainier and the sea.

You will travel on the famous "Olympian" transcontinental train through the scenic mountains. You will ride smoothly, swiftly and in comfort on the longest *electrified* railroad in the world. Open observation cars during the summer months.

$104 *The Grand Circle Tour Costs Only $18 More*

By paying only $18 more for your ticket, you can see the Coast—Portland, San Francisco, Los Angeles—and return by choice of direct routes.

Should Avoid Snobbishness

JUST because most of the people of the United States want to restrict immigration is no reason why Congress should go out of its way to insult other nations or assume an "holier than thou" attitude.

The American people have been pretty self-satisfied since the World War and they have grounds for feeling proud of their achievement, but there is no reason why they should become snobs or allow their Congress to snub the people of other nations. Victory seems to require greater self-control than adversity, and the people of the United States should keep their feet on the ground and see that their Congress plays the part of a gentleman.

If we have the greatest nation on earth, if we have the greatest resources in the world, if we have all those things which go to make happiness, there is no reason why we should take a kick at those who would like to share all these good things with us. The Immigration Restriction Bill is mostly the result of prejudice. MANUFACTURERS NEWS suggests to its readers that they bring these matters to the attention of the members of Congress.

A Bill Which Would Promote Strikes

REPRESENTATIVE WOLF'S bill, H. R. 5338, introduced in the House of Representatives to regulate the transportation and importation of labor to any point where a labor disturbance or strike is in progress, if enacted into law, would effectually tie up railroads, mines or any other national industry and inevitably would be followed by great misery and suffering on the part of the public. Under this bill it is made unlawful for any person to import, transport or induce labor to go to any point where a strike is in progress, unless the men shall be made acquainted with all conditions affecting labor at that point.

Such imported labor, under the provisions of the bill, must receive some compensation and no more than the amount offered the labor on strike. Penalties of from $100 to $1,000 are provided for each violation. It is one of the measures now pending in Congress which would give organized labor a more deadly strangle hold on the public than it now possesses.

It is on a par with the bill which aims to establish closed shop conditions for all the railroads. Closed shop conditions now exist in most of the coal mines of the country and have been responsible for much trouble and bloodshed, as at Herrin, Illinois, and the occasion of great distress to the general public.

What this country really needs is greater authority to place independent workers when and where they are willing to work in their own and the public's interest.

The Dawes Solution

THE *New York Times* editorially observes: "The Dawes solution now says: 'Let's see by trying whether the thing can be done,' and now everybody is wondering why that answer had never been thought of before." It had been thought of before. George R. Meyercord, of the Meyercord Company, Inc., a former President of the Illinois Manufacturers' Association and at present a Director of the organization, advocated a gold basis plan nearly two years ago. The agitation attracted considerable attention and the only reason it was not adopted was because it was too simple—it was not complicated enough.

ew Chicago Bank Building Unique

Illinois Merchants Structure, Housing Three Great Financial Institutions, Ranks First in Middle West

THREE great banking institutions, each holding a unique position in Chicago's financial field, have united in the erection of a mammoth banking office building which is challenging nal attention in building and banking es. This is the massive, dignified, ty-one story structure of the Illinois hants Banks, a merger of the Mer- ts Loan & Trust Company and the Illi- Trust & Savings Bank and the affiliated Exchange National Bank. The first nave been consolidated physically, and ılready occupying the banking quarters ıe Eastern half of the ding, facing on Clark et; the Corn Ex- ıge National will have ommon interest with merged state banks, will continue business er its national name charter. It will oc- y the banking section ne Western half of the ding; facing on La- e Street, as soon as its rters are completed.

he new, or Western, of the giant office lding will be opened occupancy on May 1, at that time Manu- turers News, will be alled in its new home, te 910. The street ad- ss will be 231 South alle Street. The Illi- s Manufacturers' Association and the nois Manufacturers' Mutual Casualty ociation, Incorporated, will also be lo- d in this building.

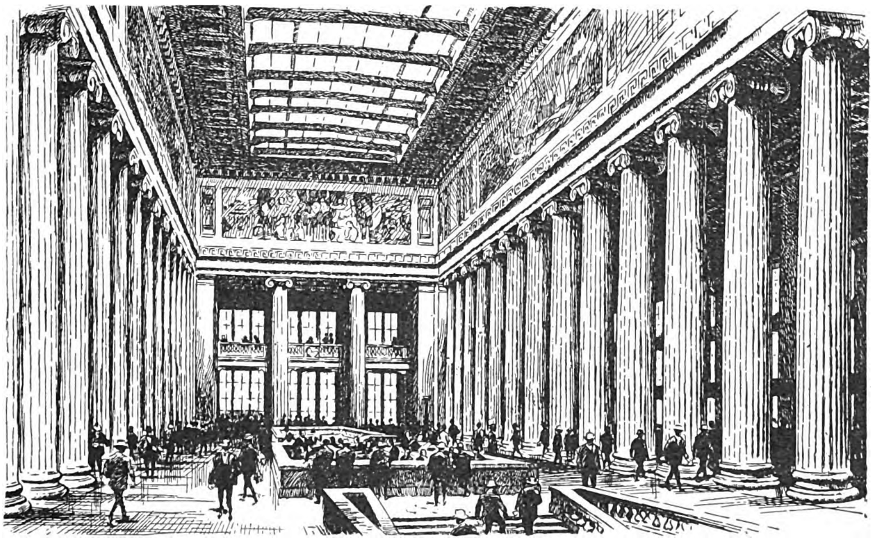
Chicago's most impressive building" is apt description given this huge pile. ing 260 feet from the street level, it ks first among Chicago's office buildings among the greatest in the world.

he story of this bank and office building romantic one. It covers a site 174 by feet, a total of 59,000 square feet,—the ire block bounded by Clark, Quincy and alle Streets and Jackson Boulevard. It ın historic site, that of the famous old ınd Pacific Hotel.

The building is of Indiana limestone, a y white material which lends added ct to height and impressiveness. The igners of the building, Graham, Ander- , Probst & White, followed somewhat design of the great Treasury Building Washington—the long colonnaded front Ionic character, stretching unbroken m Clark to LaSalle Street, along Jack- . Boulevard, and the great central porti- of free standing columns opening on both Clark and LaSalle Streets.

But the crowning feature of the exterior of the building—something new in Chicago office building architecture—is the main cornice of heavy cast burnished copper, decorated with gilt and color.

No general contract was left for the construction work, supervision being under the direction of a Building Committee composed of Stanley Field, Chairman Chauncey Keep, James P. Soper, Martin A. Ryerson and Charles L. Hutchinson. When the old Grand Pacific Hotel had been wrecked and removed, there followed the huge task of excavation—removal of 54,000 wagon loads of earth and debris. Then came the digging of seventy-eight caissons, averaging 5 feet in diameter, a job that was completed in the record-breaking time of twenty-seven days.



General View in Main Banking Room Showing Glimpse of Main Stairway.

Banking Room Classic

Erection of the building has given continuous employment to approximately 600 men for two and one-half years, while the preparation of the materials used occupied another 1,200 men for a similar period. Among the items going into the construction of the building were some 16,000 tons of steel, 13,000 tons of stone, 33,000 tons of fireproofing tile, 7,000,000 brick, 280,000 bags of cement, 162 miles of wiring, 71 miles of wire conduit, more than 100 carloads of Italian marble for nearly 3 miles of corridor floors, 3,400 windows, and 4 miles of Carrara marble wainscoting for corridor halls. The interior finish is in choice mahogany, specially selected for color and grain, and in combination with the fine marbles, has been used lavishly.

The main banking room, extending the entire length of the block from Clark to LaSalle Street, is classic in design. It rises 53 feet from the floor to the ceiling, the equivalent of four stories of ordinary height. It is open to the light on four sides and is canopied with a skylight of special opaque glass. Twenty-eight fluted columns of Cunard pink marble divide the open lobby from the bronze banking cages. The floor is of Hauteville marble from France.

The contractors for the erection of the building and furnishing materials and fixtures were:

BUILDING CONTRACTORS

Henry Ericsson Co., foundations, caissons, shoring, masonry, concrete work.

Chas. G. Fanning & Co., cut stone.

The Steven & Son Co., stone setters.

Edmunds Manufacturing Co., carpentry, interior woodwork.

E. V. Johnson Co., fireproofing and setting.

Mehring & Hanson Co., heating, ventilating, power plants.

Johnson Service Co., temperature control.

R. J. Powers, plumbing.

W. J. Newman Co., wrecking, excavating.

Chas. Johnson & Son, fire escapes.

Rising Decorating Co., painting.

Imperial Waterproofing Co., waterproofing.

E. E. Davis Co., rubber and cork tile floors.

Sager Metal Weatherstrip Co., weatherstrips.

Central Asbestos and Magnesia Co., stack and ceiling lining.

Coleman Hardware Company, sash pulleys.

MATERIAL AND FIXTURES

Indiana Quarries Company, Indiana limestone.

American Bridge Company, structural steel.

Hydraulic Press Brick Co., face and enamel brick.

Carey Brick Co., common brick.

Astoria Mahogany Co., Inc., mahogany.

Geo. B. Carpenter Co., contractors' supplies.

Crane Co., heating and plumbing supplies.

J. C. McFarland Co., copper cornice, metal windows.

The Carbondale Machine Co., refrigerating plant.

Johns-Manville, Inc., Johns-Manville insulation.

The Harris-Preble Door Co., tunnel isolation gate.

Thomas Elevator Co., hoisting elevators.

National X-Ray Reflector Co., lighting fixtures.

Fischer & Hayes Rope & Steel Co., scaffolding.

Symonds Clamp Mfg. Co., column clamps.

Citizens Service Bureau, cinders.

Sterling Wheelbarrow Co., construction equipment.

National Concrete Specialties Co., spacer clips.

Standard Electric Mfg. Co., push button switches.

(*Continued on page 23*)

Advertising Is "Commercial Sleeping Sickness" Remedy, Says Mrs. Blackwood

Mrs. Bernice Blackwood Moffet Photo

THE proprietor of a general store sat sound asleep, his nether extremities crossed on top of the stove, his chair tilted back. It was a peaceful scene. The shelves and tables were filled with goods. Persons passed and repassed the store, but none came in to disturb the merchant's slumber. That very morning he had walked up and down the aisles and rubbed his hands in satisfaction in contemplating the big stocks that filled his store.

A small boy toting a brown jug quietly opened the door, stole in, edged up to the sleeping merchant, jabbed him on the arm and said:

"Mamma wants some molasses."

Down went the legs from the stove with a crash. There was a rubbing of eyes, and the boy backed away a little in fear. Impatience, almost amounting to anger, covered the merchant's face as he snarled at the boy:

"Ain't there nobody in this town sells molasses but me?"

Of course we know this is an extreme case. But we also know of business men who are afflicted in some degree with "commercial sleeping sickness." And, mind you, this malady is not confined to country store keepers. Sometimes it attacks men who own warehouses filled with products that ought to be in freight cars on the way to consumers.

But this is no preachment; you recognize the disease wherever you run into it. Trade associations have discussed and diagnosed it, and they long ago decided there is only one known remedy for this commercial sleeping sickness.

ADVERTISING—the whole story is in that word.

Now, you would think that a class of men who have had the energy and nerve to engage in any line of business would want the whole world to know about their product or proposition—would advertise their business as effectively and widely as possible.

It is an amazing thing, and a sad commentary upon the foresight and business sense of America, that it has been necessary to "advertise advertising." And in giving publicity to this fact, this story you are now reading goes a step further and is advertising an institution which advertises advertising. That, it would appear, is going some.

So you see what a great public service the Advertising Specialty Association is doing. It was to help business men see the necessity of advertising that makers of advertising specialties organized in a spirit of service. Its members include manufacturers and jobbers of calendars, signs and advertising specialties. To further the work of the Association, it carries membership in the Associated Advertising Clubs of the World, the National Advertising Commission, and the Chamber of Commerce of the United States. The officers are U. Rae Colson, President; Chas. R. Frederickson, 1st Vice-President; E. L. Hartley, 2nd Vice-President; L. L. Joseph, Honorary Vice-President; G. Felsenthal, Treasurer; Bernice Blackwood, Executive Secretary.

Mrs. Blackwood, the Executive Secretary, who presides over the Association's offices at 20 East Jackson Boulevard, Chicago, is, as her title would indicate, the working head of the organization. Now, the conventional writer at this point would enter into rapturous and fulsome word portrait of this splendid type of "The Woman in Business." No higher compliment can be paid her than merely to remark that anything of the kind would be deeply offensive to her. She, and her sisters who today grace high places in the business and official world, it is observed, occupy their positions through sheer force of intellect, character and capability.

In conversing with almost any live business man you often catch a note in his talk about his pet hobby. Every normal person has a hobby of some kind. It may be radio, golf, fishing or most anything in the world—except tending that unspeakable furnace in the basement.

Mrs. Blackwood has two—two hobbies, not two furnaces. They are her 9-year old daughter, whose fair features in a panel picture on the wall of the office watches her mother at her desk, and the film "The Way to Success." "Old Man" Barton in this picture is much the same kind of a chap as the store keeper you found asleep when you started to read this article. He has been in business thirty years without advertising, and doesn't purpose to begin now or be hornswoggled into it. Well, the film shows, by incidents that run two reels, how the old man was healed. There is a story to carry interest and a romance which ends happily with the young couple "living happily" forever afterwards.

This film, created and fostered by Mrs. Blackwood, made a tremendous hit before the Associated Advertising Clubs of the World, and she and her department, the Advertising Specialty Association, were highly commended. It is shown all over the country. At present it has more than 400 bookings, and other requests for its use are coming in at the rate of twenty to thirty a week. Rotary, Lions and Kiwanis Clubs are making excellent use of it as the leading feature of entertainment programs.

Mrs. Blackwood is the only woman member of the National Advertising Commission, the controlling body or Supreme Court of the Advertising Clubs. This Commission meets four times a year in various cities. She also was formerly President of the Woman's Advertising Club of Chicago.

Officers Nominated for Credit Men's Association

Nominations for officers for the ensuing year for the Chicago Association of Credit Men were announced at the annual banquet of the Association held last Thursday evening at the Hotel LaSalle. They were:

President, James M. Judson, Sinclair Refining Company; Vice-Presidents, Ernest H. Burgess, Edward Hines Lumber Company and Albert H. Fabbri, Northwestern Expanded Metal Company; Treasurer, Frank M. Forrey, Continental & Commercial National Bank.

The ten directors nominated were Louis C. Beaudry, P. F. Pettibone & Co.; Byron F. Dudley, Wm. E. Dee Co.; Roy G. Elliott, Jaques Manufacturing Co.; W. H. Feasel. Cooper Underwear Co., Kenosha, Wis.; E J. McKone, Sinsheimer Bros. & Co.; H. J. Rumsey, Vesta Battery Corp.; Otto F. Schultz, Western Felt Works; Frank C. Smith, Carter White Lead Co.: Thomas J. Sullivan, Inland Steel Co.; Edward M. Tourtelot, First National Bank.

The election of officers will be held at the May meeting of the Association, the date of which has not yet been announced. Speakers at the annual banquet were John T. McCutcheon of the *Chicago Tribune* and President of the Chicago Zoological Society, and Rev. Claude J. Pernin, Professor of Literature at Loyola University.

Steamship lines entering the Port of New York landed during the twelve months of 1923 a total of 606,054 people traveling first, second and third class, according to records of Ellis Island prepared by W. C. Moore, landing agent.

Divided as to class Mr. Moore's report shows that of the total number 84,834 traveled first class; 214,561 second and 306,659 third. In bringing this number of people into the United States a total of 1,002 trips were made.

What Italians Have Done for U. S.

Leaders in World Thought and Action, Both Past and Present—Immigration Act Discriminates, Says Writer

By ITALO E. CANINI

Written for
Manufacturers News

ITALO E. CANINI, a good Italian and an American citizen, resents the charge that Italians do not make good American citizens and should be shut out by our immigration law. At the request of MANUFACTURERS NEWS he has written a series of articles, of which this is the first, telling what the Italians have done for the United States, beginning with the discovery of America by Christopher Columbus and named after another Italian, Amerigo Vespucci.

Mr. Canini, a Vice-President of the Italian Chamber of Commerce in Chicago, has been a resident of the United States for forty-eight years. He came to this country when he was 16 years old as an attache of the Italian Commission at the Philadelphia Centennial in 1876. He liked the United States so well that he never returned to his native Italy except to visit.

From 1878 to 1882 he was Secretary to the Italian Consulate at Philadelphia. He then went into business, and has been in Chicago since the World's Fair as an importer of art objects. Mr. Canini is descended from the old Roman family that founded the town of Canino near Rome, but for centuries his ancestors have lived in Venice. He is the author of "Four Centuries of Spanish Rule in Cuba."

I

IN the city of Washington; in the District taking its name from an Italian; in a building called "Capitol" after the famed Roman citadel and ose magnificent architecture was in-red by the wonders of the Italian Renais-ice, under a dome decorated by the Ital- art of Brumidi and Costaggini, a bill being discussed by the Congress of the ited States to discriminate against the migration of Italians into s country, and to reduce it almost zero. It is asserted at the Italian race is inferior some of the others com-sing the American nation, at it is incapable of assimi-tion with them and, further-ore, that if such an assimila-on took place the result ould be detrimental to our untry. The claim is made at Italians could not under-and American ideals, nor preciate our institutions.

The race to which Congress-ian Albert Johnson, voicing e clamor of the fanatics who ould do away with the ealthy growth of this land, ssigns so deplorable a con-ition of inferiority, is that to hich belonged the man who, efore all others, made it pos-ible by his genius, courage nd perseverance for Mr. ohnson to sit in the halls of ongress as representative of section of the continent to hich another man of that stock gave his ame. The Northern part of this conti-ent was explored by the Venetian, Giovan-i Caboto and his three sons, Sebastiano, odovico and Santo; Enrico Tonti of Gaeta, companion of La Salle; the Florentine errazzano, the result of whose travels, nd of those of the French explorers, was irst made known to the world by the charts nd maps of Battista Agnese, Gastaldi, and ther Italians. A region in which Father iuseppe Bressani, together with the French nissionaries, spread the word of the Gospel t the cost of his life.

"It is the race from the land which alone n the history of all mankind"—says Pas-uale Villari (*Italy and Civilization;* Mi-an, 1916)—"can lay claim to the succes-ion of four different civilizations: Etrus-an, Roman, Church and Commons, and the resent." The race which, for the past 2,500 ears, through innumerable thinkers, poets, cientists, artists and navigators, has left an ndelible imprint on everything worth while n civilized society; from Horace and Virgil to Dante and D'Annunzio; from Giotto and Michelangelo and Sansovino and Canova, to Luigi Amateis of Turin and Washington, D. C., whose monument to the heroes of the Texas Revolution is the pride of Galveston, and Ettore Ximenes, whose magnificent memorials grace the city of New York; from Papirius, whose code of civil laws was the source of jurisprudence, to Beccaria, whose writings brought about the abolishment of torture; from Flavio Gioia, he of the compass, to Galileo and Volta, to Marconi, and Giuseppe Faccioli of Schenectady, N. Y., who produced artificial lightning; from Palestrina, and Scarlatti, father of modern opera, to Rossini and Verdi, Puccini and Mascagni.

The race which for centuries held the dominion of the seas, and gave us our first lessons in modern commerce. Whenever you sign a check your name is written under an Italian word, "bank," from the "banco," a bench, or counter, on which the first bankers carried on their transactions in the market squares of Genoa. When you are in financial difficulties you are unpleasantly reminded of another Italian word, "bankruptcy," "banco rotto," a broken bench, because that of the Genoese banker who did not carry out his obligations was smashed.

What They Are Doing Today

But Italians do not wish to be judged entirely on their achievements in the past. It has been said they are the most self-satisfied people on earth and taking it for granted that the glory of their ancestors is reflected unto them, they are content to rest on this basis. This is not the truth. Italians, and particularly Americans of Italian birth or descent, while taking a natural pride in their ancestry, are, in fact, somewhat weary of hearing Italy referred to in terms of the past. Rather would they point to what Italians have done and are doing, in our day, both in the old and the new world.

Less than 100 years ago, Italy was the "geographical expression" of the Austrian Chancellor Metternich; the "land of the dead" of the French poet Lamartine; a country torn by dissensions and parcelled out among petty tyrants of foreign extraction. To-day, not only through a long list of leaders like Garibaldi, Mazzini, Cavour and Victor Emanuel II, but also, and chiefly, by the wisdom, the courage, the love of liberty, the indomitable will of her common people, Italy is one of the great powers of the earth, united and strong, a leader as of yore in the world's progress. The military genius of Diaz, and the wise and firm guidance of Mussolini, and of a king who is a man among men, have crowned the work of a century. Mussolini—the son of a blacksmith! Think of it, you who believe, or rather pretend to believe, that the children of the Italian contadino, the hard-working peasant, can never be of any use to this country. The people, who, in a few short months, from Caporetto to Vittorio Veneto, turned seemingly crushing defeat into overwhelming victory—a victory the most decisive of the war, and which dealt the death-blow to German power—have once more shown their wonderful power of recuperation.

Italy's After-the-War Record

What ideals brought forth this change? In what do those of Jefferson or Lincoln differ from those of Mazzini? Where is the truth in the statement we so often hear nowadays that Italians cannot understand American ideals, nor love our free institutions?

Industrially, Italy, since Mussolini and his Fascisti brought about the defeat of

Bolshevism, is fast assuming the place belonging to her. Intellectually, she is second to no other country on the globe. Economically, she is in a better position than any of the other European nations involved in the war, except England. Col. Robert R. McCormick, co-editor of the *Chicago Tribune*, on his recent return from abroad, after having characterized "the governments of practically every European country" as "rotten," stated that "Italy appears to be the only country which is meeting the situation with any degree of success." When an editor of the *Tribune* feels reluctantly compelled to say a few words in justice to Italy or the Italians, it is time to ring the church bells and light the fireworks, in celebration of so unusual an event.

What the masses of Italian labor have contributed to the prosperity of this country may be seen with the naked eye by looking around us. The native high class mechanic, driving an engine on a railroad track, would not have his well paid job if the newcomers, probably Italians, had not built that track. His powerful engine would not be running on it if the rails had not been made by them. The engine itself would not have been constructed by highly paid American-born workmen, or foreign-born who had been here a long time, if the newcomers' labor had not mined and smelted the ore from which it originates, nor would there be any fuel to burn had it not been taken from the bowels of the earth largely by that labor. And these examples could be multiplied a thousand times, for the brigade of unskilled foreign toilers is but the vanguard of the army of the aristocrats of labor, the skilled mechanics, following in its wake. The sections of the country in which the greatest development has taken place in these last thirty or forty years are those to which Italian immigration has chiefly been directed. It is silly, therefore, to say, as we sometimes hear, that Italians and other people from Southern Europe wish to come here to share in the spoils, for it is largely thanks to their toil that our wealth has been created.

Concentrate In Large Cities

Among the charges made against Italian immigrants is that they concentrate in the larger cities, forming foreign colonies in them. The real reason for this concentration has been given by a writer who is by no means favorable to immigration, although he sometimes seems inclined to be fairer towards it than many others; Dr. F. J. Warne, in the "Immigrant Invasion" (New York, 1913, p. 124) says: "Prior to 1880 our marvelous agricultural development determined or controlled the direction of the larger part of the immigration stream; since that year the equally remarkable industrial demands of the country have drawn the current into the mining and manufacturing states. The same thing would have happened if the racial composition of the stream had been reversed in point of time. It is more than probable that if the Slavs and Italians had

Enthusiasm and Fore-sight Important Factors In Success, Says E. N. Monroe

MONROE DRUG COMPANY'S NEW HOME

Modern Fire-proof Factory Building at Quincy, Ill., Where Putnam Fadeless Dyes are Made

THE recent European war gave a tremendous impetus to the dye business in the United States, because the German product was entirely cut off from importation and many Americans thought that none of our home firms would be able to fill the place formerly held by the great German manufacturers. Chemists in this country turned their attention largely to developing this industry, with results most satisfactory to the trade. The field expanded rapidly, and many times great changes were necessary, new dyes involving important alterations in methods, being invented to meet the demands.

One of the Mid-Western concerns that grew with this expansion was the Monroe Drug Company of Quincy, Ill., manufacturers of the famous Putnam Fadeless Dyes, known over the entire Western hemisphere. To meet the growth in its business, this Company has recently completed a huge modern fire-proof factory building in Quincy, five stories in height and covering some 100,000 square feet of floor space.

The completion of this building and its occupancy by the Monroe Drug Company prompts an inquiry into the leadership personnel which has built up this concern to make it the world's greatest package dye manufacturing industry.

E. N. Monroe, a Director of the Illinois Manufacturers' Association, is the founder of the Company and at the age of 69 years is actively engaged as its President. Associated with him are his son, Neal E. Monroe, as Vice-President and Treasurer, and L. P. Bonfoey, as Vice-President, Secretary and Sales Manager.

Some fifty years ago E. N. Monroe was employed as a drug clerk in Council Bluffs, Iowa. In 1876, he purchased a drug store for himself in Unionville, Mo., and there his real business career began. His rise during forty years of far-sightedness and hard work might well furnish material for a romance of modern business.

He liked his work and made the most of it and, while running the drug store in Unionville, in company with J. Hugh Elson, developed a dye which would work equally well on any kind of cloth. Up to that time housewives had to use different kinds of dyes for different kinds of cloth. The new dye saved them this trouble, and again and again Monroe expanded his new business until it became too large for Unionville. He moved to Quincy and organized his company in 1895 under the name of the Monroe Drug Company.

Mr. Monroe is an ardent believer in enthusiasm and has always possessed the vision to see and seize opportunities. But his own enthusiasm has been the great driving force which has kept him actively engaged in his business. He is eager to encourage young men of ability who show this quality, and is a firm believer that enthusiasm and taking advantage of opportunities at crucial moments are the two most important factors in building business success.

One important factor which has aided in the rapid rise of the Monroe concern has been its price policy. Other package dye manufacturers have steadily increased prices, while the Quincy concern has been able to hold down its prices to pre-war levels, thus attracting business.

The policies of the Sales Department have also had much to do with the success of the Company. Everything pertaining to sales is handled direct from the Quincy office, and forty salesmen are now employed, these men covering the entire United States and foreign countries, including Alaska, Canada, Cuba, Porto Rico, Trinidad, Hawaiian Islands, Philippines, West Indies and Central and South America.

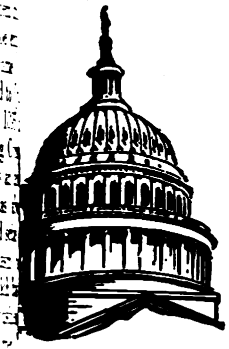
Shifting of Farmers in 1922

Twenty-seven per cent of the tenant farms and 6 per cent of the farms operated by owners changed occupants in 1922, says the United States Department of Agriculture. For all farms the average of shifting was 19 per cent. In nine States more than a fourth of the farms, including those both of owners and tenants, were operated by new occupants. These States are all in the South. Six States in which fewer than 10 per cent of the farms had new occupants in 1922 are those of the New England group. In most of the Corn Belt and Western States, the percentage of new occupants ranged between 10 and 15.

Congress Fails in Constructive Work

President Sees Results from Dawes Commission Only; Pique Ruled Senate in Passing "Jap" Exclusion Act

By JOHN M. TOWNSEND
Washington Correspondent,
Manufacturers News



Washington, D. C., Apr. 23—Congress continues to play politics with all legislation. Furthermore, Congress, particularly the Senate, continues to insist on running the foreign affairs the Government. In the meantime, Con-ess has failed completely to make a con-uctive legislative record and the present lications are that Congress will not even able to adjourn in June, although the ospect for real legislation will probably even more difficult after the National nventions than before them.

PRESIDENT'S NEW YORK SPEECH
President Coolidge, when he made his gagement several months ago to speak fore the Associated Press in New York st Tuesday, had fully expected that at this me he would be able to make a complete counting of his stewardship which would ntain some legislative enactments by this ongress in accord with his recommenda-ons in his message to Congress last Decem-er. After nearly five months of fruitless ndeavor, when the President came to write is New York speech he found he could ot lay his finger on a single constructive iece of legislation this Congress has en-cted. Instead, the President was com-elled to make the foreign relations of this ountry, as concerned by the Dawes repa-ations proposals and their bearing on orld economic restoration, the principal eature of his address and to speak of Con-ress only with reference to its numerous nvestigations, most of which are flickering ut, but none of which has yet officially nded. It is a sorry circumstance when a resident of the United States is com-elled to look abroad to find something onstructive being done because justifica-ion for optimism cannot be discovered at ome. This Congress seems to be headed n the general direction of winning the 'do-nothing" championship for all time.

THE JAPANESE PROBLEM—While Japanese exclusion has been in the back of the head of Congress ever since the Japanese immigration problem first arose twenty years ago, the sudden determination of this Congress to vote complete exclusion of the Japanese has been brought under circumstances which do not contribute to the prestige of the Senate as a deliberative body nor to the prestige of the United States as a nation which can be wholly depended upon to observe the usual amenities between nations. Nobody disputes the *right* of the United States to regulate immigration as it sees fit, not even the Japanese. On the contrary, the Japanese expressly acknowledge that right and would be glad to make a new agreement to keep all Japanese out of the United States if that is what is desired. The sticking point with the Japanese lies in the fact that they are universally recognized as one of the great powers and their pride in that fact causes them to object to being segregated with China and India or any other inferior powers in matters of legislation. Probably no immediate effect would be observed if Japanese exclusion were enacted by the Senate, but the wound thus inflicted is one that will not be healed quickly. As a means to an end, in which the principle of exclusion could be established with the consent of the Japanese Government, a treaty agreement by which the Japanese would keep all their nationals at home would be manifestly better for purposes of friendship and amity and good will, all needed for the carrying out of the Arms Conference agreements and for the improvement of commerce, than such drastic action as Congress has proposed. There can be no doubt but that the country as a whole favors the principle of exclusion, but the manner and method of going about it at a time when Japan is just recovering from one of the most gigantic catastrophes of all ages and just after Japan has shown so many manifestations of friendliness to this country, is not calculated to inspire confidence in the Oriental mind in the stability of this Government's conduct in international relationships. If the correspondence of Mr. Hughes with foreign governments during the past two years were revealed, the country, if it really takes the phrase of the Japanese ambassador—"grave consequences"—seriously, would be surprised to find out how many times Mr. Hughes has used it or its equivalent. Doubtless the Chinese and Mexican Governments could testify at length on that point. What promised to be a long drawn out and constructive debate on the Japanese immigration question was suddenly settled by the Senate in a moment of pique, based on the theory that the conduct of foreign affairs of this Government had been suddenly thrust in its hands. So much for this action by an alleged deliberative body.

If Some One Doesn't Take Her Book Away, There's No Telling What Will Happen To the Baby

REPUBLICAN POLITICS—Illinois will occupy a prominent place in this year's presidential election on the Republican side at least. Either former Gov. Frank O. Lowden or Gen. Charles G. Dawes will be drafted for some important post in this campaign, if the friends of President Coolidge have their way. Both are being talked of for Vice-President, the former because of his constructive work on domestic problems, such as taxation and the agricultural question, and the latter because of his constructive work in Europe as well as in connection with the Federal budget. These two men stand out in the West, in the eyes of the politicians here, as the constructive statesmen who have the confidence of Republican voters West of the Mississippi River where the main political battle must be fought out this Fall. Manifestly the nomination of either for the Vice-Presidency might make the other unavailable for a high place in the party machine, but if both fail at this point Gen. Dawes, at least, is being held in reserve as a possible Chairman of the Republican National Committee and Gov. Lowden is spoken of as Temporary Chairman of the Cleveland Convention. In any event, the services of both are badly wanted on the stump this Fall. It is entirely probable at this writing that President Coolidge will insist that Senator Borah of Idaho shall be the Temporary Chairman of the Convention, the "key-noter." While the veterans of the party do not take kindly to Borah as a whole, still there is not the objection to him which might be expected, particularly if the President chooses for Permanent Chairman of the Convention a man of the type of Senator James W. Wadsworth of New York. Wadsworth would also be "new blood" in the sense that he has never appeared in a National Convention in a higher capacity than that of Chairman of the New York State delegation. One thing stands out, and that is that President Coolidge is thinking only of "new blood" and that he is leaning toward the West, not only for the Temporary Chairman of the Convention, but for Chairmanship of the National Committee as well.

DEMOCRATIC POLITICS—New York Democrats last week formally launched Gov. Al Smith of that state as a candidate for the Democratic nomination for President, and they are out to nominate him if possible. Some Democratic leaders, in view of this action by New York, as well as Smith's unexpected success in garnering delegates in Rhode Island, New York, Wisconsin and Illinois, predict that Smith rather than McAdoo may actually have a majority of the Convention, although falling short of the necessary two-thirds vote to nominate. The pressing of Smith's candidacy in good faith will force the Democrats to face many issues in the Convention which they had hoped to avoid. The wet and dry issue and the Ku Klux issue cannot now be dodged by the Convention. The question of nominating a Tammany candidate in a convention held in New York itself will have to be answered. Undoubtedly Smith might carry New York for the Democrats, but the price might have to be paid in the West and South. The McAdoo and Bryan Democrats will oppose him to the last ditch. The stronger Smith grows, however, the less chance McAdoo and Bryan will have, either for themselves or their second-string candidates. The further the Democratic contest goes the more it appears that the leading candidates will "kill each other off" and a "dark horse" win out.

THIRD PARTY POLITICS—Members of the Senate report that Senators Robert M. LaFollette and Hiram Johnson are still working in greater harmony than ever before, although LaFollette admittedly looks upon Johnson as a renegade Progressive and Johnson has never found his stomach strong enough to stand all of LaFollette's nostrums. Nevertheless, further evidence that the LaFollette group in the Senate is working toward a definite end was furnished by Senator Norris last week when he suggested that Henry Ford had come to the support of President Coolidge only after the latter had decided that Mr. Ford should have the operation of the Muscle Shoals project. Both Senator Norris and President Coolidge carried the recent Nebraska primaries, but it is plainly evident that this Fall Senator Norris will campaign for votes for himself and let the National ticket "go hang," unless he finds he needs Coolidge votes to get elected. The indications now are that the third party members of Congress this Fall will play a cut-throat game, trading votes for votes for themselves wherever they can get them. What the poor farmer can hope to get out of Congress or the Government from a third party, which can only mess things up worse than they now are, is beyond the comprehension of most people in this vicinity.

22 Vessels Were Lost in Month of January, 192

Twenty-two vessels, aggregating 55 gross tons, were posted as lost during Ja ary by the Liverpool Underwriters' As ation, as compared with thirteen vessels 33,520 tons lost in January of 1923. O the number lost this year four were Ame can steam, totaling 6,489 tons, and o sail of 3,003 tons. Great Britain lost si steamers of 20,983 tons, and Japan tw steamers of 8,776 tons. Among the loss founderings and abandonment accounted for seven of the twenty-two, strandings for eight, collisions and fires and explosions for five, and two have been posted as missing, cause of loss unknown.

London Buys Siberian Furs

Approximate figures in regard to the number of the various kinds of furs accumulated in Harbin during the 1922-2 trapping season, sold and shipped from Harbin during the summer of 1923, the Department of Commerce reports as follows: Squirrel, 700,000; ermine, 30,000; kolinsky, 2,000; red fox, 4,000; white fox, 20,000; gray fox, 500; silver fox, 30; sable, 400; hare, 100,000. These furs were for the most part shipped up the Lena River and overland to Irkutsk, thence by train to Moscow, where practically all of them are reported to be sold to London buyers, and comparatively few to American purchasers.

Go where you may, you will not find its equal in all Southern Illinois!

Normal vs. Actual Overhead Costs *

Importance of Indirect Expenses and the Necessary Steps to Obtain Better Control Are Here Discussed

I

IN the early stages of cost accounting, attention was confined to the direct material and direct labor cost, or what we ordinarily know as prime A blanket overhead rate was added ɔver the indirect expenses in connec- with the plant's production. Over- was considered rather a mystery, and always solved behind closed doors. Accounting Department had no idea ɔ how the rate was determined, and not dare to inquire. With the present competition confronting manufac- rs, however, the importance of over- l is being realized more and more, and necessary steps are being taken in or- to obtain a better control of these ɜnses.

he subject of distribution of overhead ɜnses in abnormal times, or the deter- ation of a standard rate to be used in erence to the actual rate of overhead, only within recent years received any ɪt consideration. The truth is, that even ɪormal times the distribution of over- ɜ has not, in most instances, been made ı satisfactory manner, and before dis- ɜing the difficulties in connection with ributing overhead in abnormal times, ould undoubtedly be well to discuss the damental principles to be followed in mal times.

n the first place, let us state exactly ɪt we mean by overhead expenses. Dif- ɜnt terms have been used to indicate class of expenses, such as indirect cost, ense, burden, overhead, loading, on- t etc. Authors of books on cost account- have attempted to give specific mean- s to each of these terms, but little prog- ɜ has been made in this connection.

ɜroadly speaking, there are four main ɜses of expenditures to be considered in ɪnection with the accounting of any nufacturer:

. Capital expenditures, or those expenditures ch are incurred to obtain the permanent as- which will be used for the purpose of manu- ɜuring finished goods and carrying on the rations of the business. They include such ns as land, buildings, machinery, equipment,

. Manufacturing or production expenses, or se expenditures made in connection with the duction of an article up to the time the article ɜompleted and placed in a warehouse. This is ıally summed up by saying that the cost of duction ends at the factory door.

. Selling and administrative expenses, or those ɜenditures made in connection with the market- and distribution of the product after all pro- ɜtion costs have been taken into consideration. this group are such expenditures as salesmen's ɜries, salesmen's traveling expenses, advertis- , officers' salaries, general office rent, general ce expense, etc.

By JOHN C. NAYLOR
Comptroller, Pet Milk Company
St. Louis, Mo.

4. Deferred charges, or those expenditures which have been made in advance of the period during which the advantage of the expenditure will be realized. Examples of this class of expenditures are prepaid insurance premiums, prepaid interest, etc.

While it is our desire to discuss only the second group of these expenditures, and to discuss this group from the standpoint of cost accounting, rather than from the standpoint of management, it might be said in passing that the division that is required for cost purposes also answers another purpose, and that is placing of responsibility. Responsibility for production, selling and administration should not, under any form of management, be shouldered by one and the same individual. The need for separating this responsibility is particularly noticeable when the plant is physically separated from the general office. In order to obtain a control of this responsibility it is necessary to obtain complete reports as to the expenditures made by each department.

Dividing Manufacturing Costs

Manufacturing costs are further subdivided into direct charges and indirect charges. Direct charges represent those expenditures for materials or labor which enter into and form a part of the finished product, such as the lumber in a chair, the leather in a portfolio, etc. Indirect charges, on the other hand, represent those expenditures which cannot be charged economically or directly to the finished product, such as labor supervision, depreciation, etc.

Inasmuch as it is more difficult to distribute the overhead expenses than the direct expenses, it is desirable to charge expenses directly to the process or department, wherever possible, thus decreasing the amount charged to the overhead expenses, which must later be distributed in an arbitrary manner. Even where it is not possible to take care of certain materials by means of the usual stores requisition, the direct charging of these materials may be made possible by means of pre-determination methods.

While the plan of direct charging is in general desirable, in order to reduce the amount of expenses charged as overhead, abuse of this plan must be carefully avoided. Common sense should always prevent one from charging some items direct, although from a theoretical standpoint they are direct materials. As an example, consider the thread used in manufacturing a hat. Theoretically the thread is a direct material, as much as the band or trimmings, but the cost of determining the amount of thread used would be more than the cost of the thread itself. In such cases, therefore, it would be foolish to consider this item as anything but overhead.

Mention has already been made of the common practice of adding a blanket percentage to the prime cost, in order to cover overhead expenses. These overhead expenses are frequently thrown into one account, with the result that at the end of the year no information showing the nature of these expenses can be readily obtained. One of the first things that should be done is to provide a "Card of Accounts" which will analyze the various overhead expenses. Accounts should be carried for rent, insurance, depreciation, taxes, repairs, general plant expense, etc. At the end of the period it will then be possible to make comparisons between the amounts expended for these various items during the current period and the preceding period or with any other period which may be chosen. A careful study of these statements will enable the management to detect various leaks and avoid many unnecessary expenses.

It is not sufficient merely to segregate the various items of overhead expenses into general groups, such as those just mentioned. This classification of expenses should be extended to each department of the business, for it is a well-known fact that practically all departments of the average plant operate under different rates of burden. It is, therefore, dangerous to use an average rate of overhead covering the products manufactured by different departments. An illustration which has come under my observation will make this point clearer. A certain manufacturer of automobile parts took in considerable outside work in order to keep his plant busy. This manufacturer had one department equipped to handle drop forgings, and another one equipped to handle nickel plating. A general overhead rate of 125 per cent was applied to the product of each department, and was also used in connection with making quotations on inquiries. Investigation showed that the actual overhead of the drop forging department was 190 per cent, whereas that of the nickel plating department was only 50 per cent. Under such conditions it is easy to understand why his bids for nickel plating were always high, and that very little business was secured for this department, while, on the other hand, many orders were received for drop forgings, which were, of course, at a loss.

Reports Should Be Monthly

At the end of each period it is, of course, desirable to prepare statements of the various overhead expenses. It frequently happens that these statements are prepared only once a year, in order to get the flat

---

First installment of abstract of recent ad-ɜss before Illinois Manufacturers' Costs sociation.)

overhead rate to be used during the following year, but attention should here be directed to the fact that the managerial value of such statements is equally as important as the determination of an overhead rate. For this reason these statements should be prepared, not only at the end of the year, but at the end of each month, in order that the management may know the amount of expenses that have been incurred, and may take the necessary steps in order to reduce excessive expenditures.

While it is desirable to prepare statements of the actual overhead in order to give the management a current report on the expenditures which are being made, it does not follow that the actual burden should be distributed to the cost of the product made during that period. There are certain objections to using the actual burden and, as previously suggested, the necessity for a standard rate is being realized more and more.

If the actual burden is used, considerable delay is caused in connection with the costing of the product. It is, of course, necessary in many instances to cost the product before the end of a period, and in most instances the actual burden is not determined until several weeks after the end of the current month.

Even the average for a short period cannot to be used on account of the great variation in the size and frequency of various expenses. This variation, to a certain extent, is taken care of by those accounts known as deferred charges, but consideration also must be given to this item in connection with the determination of a standard rate of overhead. Certain businesses also have seasonal features, which prohibit the use of a rate based on a short period, such as the seasonal variations which exist in the ice and coal business, or the panama and the felt hat business, etc.

Not only do the expenses vary, but the quantity of production is subject to many interruptions. Labor strikes, transportation tieups, machinery breakdowns and any number of other causes tend to make it difficult to estimate the quantity of production which will be compelled to stand the operating expenses. This situation is aggravated by the fact that, even when the plant is not being operated on account of these various interruptions, many expenses continue. Taxes, rent, insurance and depreciation in connection with both the buildings and machinery, continue at practically the same level. While it is theoretically possible to discharge the various factory men, as a matter of practice, many odds and ends are found for them to do. Nor is it possible to sacrifice the executives, the best salesmen, the best accountants, etc.

(To be continued)

Commerce Chambers in U.S. Join in Boll Weevil Fight

One hundred and thirty Chambers of Commerce in the Cotton Belt have been asked by the Chamber of Commerce of the United States to join forces with it in a general campaign throughout the present year for the stabilization of cotton production by control of the boll weevil. Member chambers in the Cotton Belt will be supplied with information for use in the campaign, including the following:

1. Facts and figures showing the trend of world supply and of demand for raw cotton;
2. Material indicating the part played by export cotton in the preservation of the national trade balance;
3. A survey of the possibilities of increased production of cotton in foreign lands;
4. Data showing the steadily increasing consumption of American cotton by our own mills with the proportionate falling off in our cotton exports.

Smaller Winter Wheat Seeding

Decreased winter wheat seedings in the United States, Canada, and Rumania, as compared with last year, are reported by the United States Department of Agriculture in its review of world agriculture. The area seeded to date in the three countries is estimated at 44,273,200 acres as compared with 51,384,900 acres reported to the same date last year. Fall seedings in Russia are also reported to be less than last year.

"Orduna" Adds Ports of Call

Beginning May 31, the Royal Mail Steam Packet Company is inaugurating a new Summer service with the steamship "Orduna," which will add Plymouth, England, Belfast, Ireland, and Greenock, Scotland, to her regular ports of call.

S. Delegates to World Agriculture Meet in Rome

neteen American delegates to the Inter- onal Institute of Agriculture which hold its seventh biennial session at e May 2-10 have been appointed by the artment of State on the recommendation ecretary of Agriculture Wallace. The gates are: Hon. Myron T. Herrick, Am- ador to France; Hon. Henry P. Fletch- Ambassador to Italy; Dr. A. W. Gilbert, missioner of Agriculture of Massachu- ; Dr. H. C. Taylor, Chief, Bureau of icultural Economics, Washington, D. O. E. Bradfute, President, American n Bureau Federation; Prof. Wm. H. enson, Iowa State College; Dr. J. G. nan, Director, New Jersey Agricultural eriment Station; Charles W. Holman, etary, National Board of Farm Organi- ons, Washington, D. C.; W. J. Robinson, sident, Washington Wheat Growers' As- ation, Spokane, Wash.; B. W. Kilgore, sident, American Cotton Growers' Ex- nge; Mrs. Charlotte B. Ware, Secretary, erican Committee for the International itute of Agriculture, Boston; Dr. Tait ler, *The Progressive Farmer*, Memphis, n.; E. L. Harrison, Manager, Farmers' ion Cooperatives, Lexington, Ky.; Dr. G. Nourse, Institute of Economics, Wash- ton, D. C.; Dr. Denys P. Myers, Corres- ding Secretary, World Peace Founda- n, Boston; Lawrence H. Parker, World ricultural Society, Amherst, Mass.; Jos. Becker, Bureau of Agricultural Econom- Washington, D. C.; E. A. Foley, Agri- tural Commissioner, London; G. C. ler, Bureau of Agricultural Economics, shington, D. C.

The chief proposal to be made to the titute by the American delegates is that Institute encourage the several govern- nts to conduct comparable national sur- s concerning agricultural economic con- ions throughout their respective areas.

23 Gasoline Production Touched New High Record

Gasoline production in the United States ained a new high record in 1923, when 55,945,143 gallons were produced, tes the Department of the Interior, ough the Bureau of Mines. The figures resent an increase of 21.83 per cent over 1922 gasoline output. While a record- eaking production of gasoline was being gistered, the demand for the product at- ned an even greater percentage of in- ease. For the year 1923 the indicated mestic demand amounted to 6,685,035,- 0 gallons. Exports were 871,116,614 llons, which added to domestic demand ows a total demand for the year amount- to 7,556,151,894 gallons, an increase 26.64 per cent over the total demand 1922.

Gasoline stocks on hand Jan. 1, 1924, re 1,074,899,650 gallons, an increase ring the year of 191,106,789 gallons or .62 per cent. This increase in gasoline cks compares favorably, from the refiners' point of view, with the increase of 50.80 per cent in stocks during 1922.

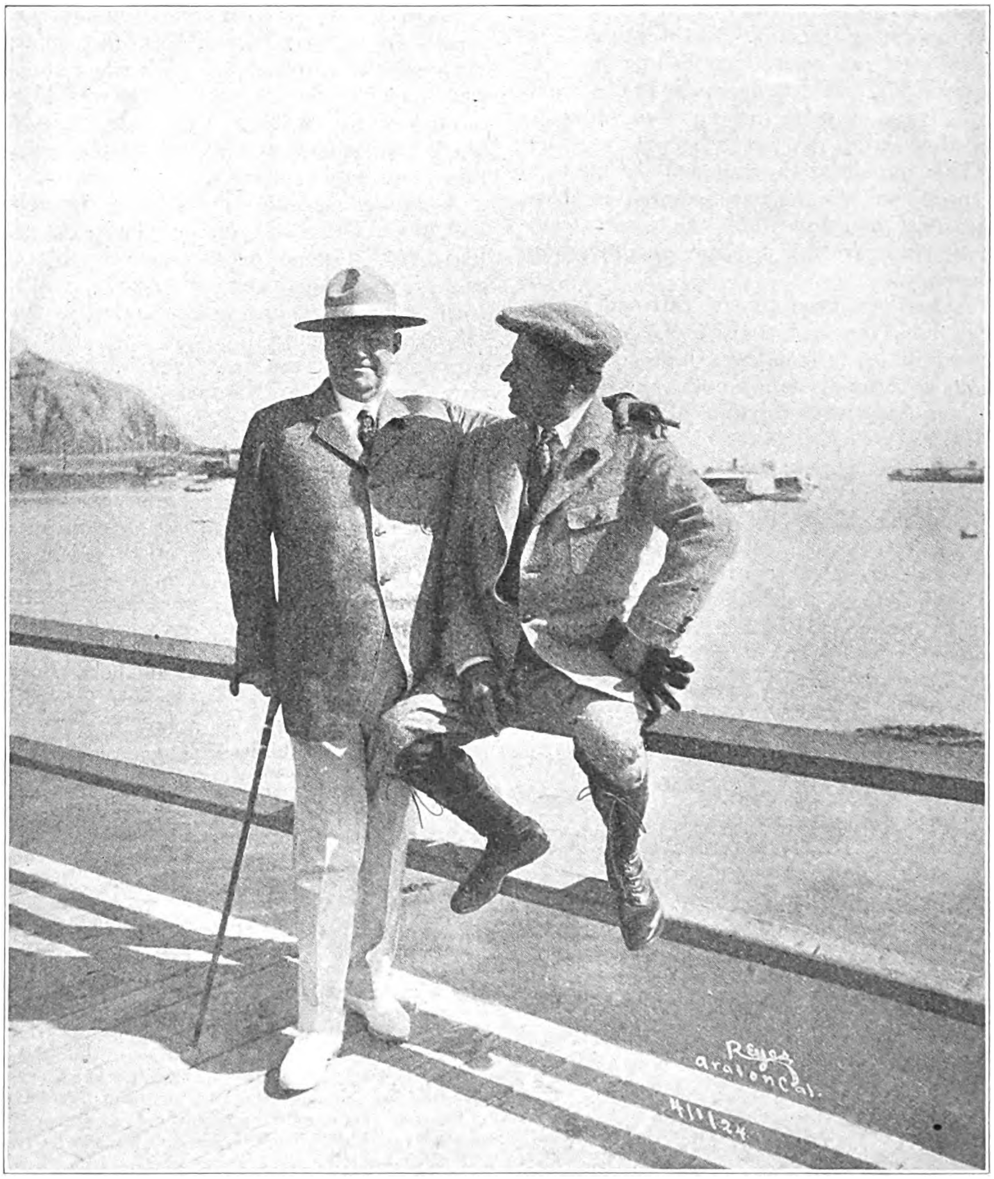
Imports of gasoline in 1923 were 191,313,540 gallons, an increase of 207.91 per cent over the preceding year. The total new supply (production plus imports) in 1923 was 7,747,258,683 gallons, or 23.67 per cent over the 1922 new supply. For the entire year the new supply exceeded the total demand by 2.53 per cent.

Link-Belt's New Vibrating Screen

There has recently been put on the market by the Link-Belt Company of Philadelphia a screen for fine separation that is novel in principle. The necessity for effective and thorough screening of many fine materials has long been recognized and this screen, known as the Link-Belt Vibrating Screen, has been developed to meet these rigid requirements.

Vibrations of the Link-Belt Screen are produced by the action of an unbalanced pulley supported on the screening frame and rotated at high speed. Every portion of the screen surface is vibrated uniformly, with the result that the entire surface is utilized for its most effective work. It is finding extensive use in the screening of by-products of coke, gypsum, cement, fertilizers, coals, pigments and chemical products.

Discussing Gum, Coal or Politics?



HERE we have two of our distinguished manufacturers—Frederic W. Upham, who manufactures coal and at intervals acts as Treasurer of the Republican National Committee; grim looking, but really most good-natured. Also William Wrigley, Jr., who furnishes gum for the universe. You might think they were on the Riviera and that was the Rock of Gibraltar. Not so. They are on Mr. Wrigley's own private island, Catalina. The island is noted for its glass bottom boats and goats which leap from crag to crag in the mountain fastness of this romantic spot and grow to such immense size that they are used in the place of riding horses, which cannot be kept on the island because they are scared of the flying fish. Mr. Wrigley has just been riding his favorite goat.

TRANSPORTATION

Railroads of U. S. Expect to Earn 5½% on Tentative Valuation In 1924—Result of Increased Efficiency

LEADING railroad executives of the United States state that, basing their judgment on the first quarter of 1924, they expect the Class I carriers of the country to earn during the present year close to 5½ per cent on their tentative valuation, or more than $1,050,000,000 in net operating income. This would compare with net operating income in 1923 of $977,657,867 for the same roads, equal to 5.10 per cent on the tentative valuation for that year.

This improved showing will be made, it is predicted, on the basis of smaller gross earnings than for 1923, the direct result of better operating methods and increased efficiency.

A further development railroad executives look for during 1924 is a more even tendency in railroad earnings, especially from a regional standpoint.

The tentative valuation of the carriers will total $19,744,582,000 for 1924, a gain of $916,000,000 over 1923. This would make it necessary to earn nearly $50,000,000 more in 1924 than in 1923 in order to show the same rate of return as was indicated by 1923 reports.

Should these predictions be carried out the railroads will make their best record under the Transportation Act of 1920. In 1922 net operating income totaled $776,880,986, or 4.14 per cent on the valuation of the carriers at that time.

Class I Road Pays U. S.

The first payment from a Class I railroad under the "recapture clause" of the Interstate Commerce Act was received recently by the Interstate Commerce Commission. The remittance was made by the Richmond, Fredericksburg & Potomac Railway Company, which turned in $169,343 for the calendar year 1922. The "recapture clause" provides that carriers shall remit one-half of their excess net operating income.

R. R. Hospital Expenses

Operating four hospitals and maintaining facilities along the line for the medical and surgical treatment of employes of the Northern Pacific Railway cost the Northern Pacific Beneficial Association $483,916.39 during 1923, according to figures just compiled for the Association's annual report. This was an increase of $12,942.67 for hospital and line operation over the previous year. A total of 67,244 cases were treated, an increase of 6,027 over 1922. The hospitals cared for 18,805 cases and 48,439 cases were taken care of by doctors along the line. This was an increase for the year of 2,490 hospital cases and 3,537 line cases. The hospitals are at St. Paul, Glendive, Missoula and Tacoma.

50,000,000 Meals on Dining Cars

Between 40,000,000 and 50,000,000 meals are served annually in the diners on American railways, according to a study just made by the Bureau of Railway Economics of the Railway Diningcar Service. Sixty railroads in the United States maintain a dining-car service.

A dining car today costs approximately $50,000. Thus a carrying charge of at least $3,000 must be assessed against it each year. The upkeep of the car, in the form of maintenance and repairs, is another considerable item of cost. Other large expenses are for linen, silverware, china and glassware. A large Western road presents the following interesting figures on some of the costs of dining-car operation: Laundry bill of 4 cents for each person patronizing the car; crew cost of 40 cents for each person served; 5 cents per person for fuel and ice; other pertinent items of expense, 27 cents a person.

Mexican Rules on Shipments

The International-Great Northern Railroad has issued a bulletin to shippers giving some pertinent facts regarding "l c l" freight from the United States to Mexico, as follows:

1. No through rates in effect.
2. No through ladings can be issued.
3. All freight must be billed care of a custom brokers at Laredo, Tex., or other border points.
4. All shipments must break bulk at the border for Custom House revision.
5. All shipments must be rebilled at border points for Mexico destinations.
6. The method of handling shipments at all border points is the same.
7. The method of handling shipments from border points to Mexico destination is the same.
8. Therefore, so-called "through package" car service from points in the United States to points in Mexico, under existing conditions, is not practicable and would neither expedite the movement nor save rehandling at the border.
9. Through package cars are operated to Laredo, Tex., as follows:

Daily from Chicago, Ill., via Wabash, Mo. Pac., T. & P., I.-G. N. R. R.; sixth morning arrival.
Daily from St. Louis, Mo., via Mo. Pac., T. & P., I.-G. N. R. R.; fifth morning arrival.

The Chicago representative of this road is H. H. Taylor, 115 South Dearborn Street; in St. Louis, it is Ashley Poynor, 2024 Railway Exchange Building; at Laredo, Tex., E. B. Wright, I.-G. N. freight depot.

Adds 513 New Freight Industries

A total of 513 new industries, developing freight traffic estimated at more than 6,500,000 tons annually, were established on the lines of the Pennsylvania Railroad System in 1923, according to a report compiled by the Company's Industrial Department. The growth of industries on the Pennsylvania Railroad last year was the greatest of any railroad in the country. The newly established enterprises are expected to load over 186,000 freight cars annually. Provision has already been made for the construction of 237 private sidings to handle the increased traffic.

M. C. Taylor on Erie Board

The election of Myron C. Taylor, a Director of the First National Bank of New York, to the Board of the Erie Railroad gives that bank a larger voice in the management of the road, in which it is understood to have increased its holdings in the last year.

N. Y., N. H. & H. Stockholders

The New York, New Haven & Hartford Railroad had 24,796 stockholders on December 31, 1923. The largest holding was that of the Pennsylvania Railroad amounting to 53,125 shares. This was an increase over the year before of 5,000 shares, owing to the transfer of stock formerly carried in the name of Dewitt Cuyler.

Siamese Railway Makes Money

The Siamese State Railways enjoyed success during the fiscal year ending March 31, 1923, according to reports received through the American Legation in Bangkok. Despite the fact that considerable sums were devoted to improvement and extensions, these railways show a satisfactory return on invested capital. With an area of 195,000 square miles and a population of over 9,000,000, Siam had 1,485 miles of railway open to traffic at the end of March, 1923, the principal lines being the Northern line, joining Bangkok and Chiengmai, and a branch to Korat, and the Southern line from Bangkok to Petchaburi and Sungei Golok in the extreme South, with a branch line from the Haad Yai Junction to Padang Besar on the Southern border. A new line authorized, by royal proclamation, is an extension of 193 miles to connect Korat on the Northern line with Ubil Rajdhami, a town on the Eastern border. This will open a large territory heretofore accessible only by highway.

WELLER EQUIPMENT

WILL TAKE CARE OF THE LABOR SHORTAGE. DOES THE WORK OF A GANG OF MEN

FOR THE ECONOMICAL HANDLING

of the raw materials and finished product there is a Weller System.

THE INITIAL COST AND OPERATING EXPENSE

is very low compared to the great saving accomplished.

SUBMIT YOUR PROBLEM

Our Sales Engineers will be glad to call and recommend equipment adapted to your requirements.

WELLER MADE CHICAGO

WE MAKE
Belt Conveyors, Bucket Conveyors, Chain Conveyors, Spiral Conveyors, Bucket Elevators, Car Pullers, Power Shovels, Skip Hoists, Coal and Ash Handling Equipment, Etc.

WELLER MFG. CO.

FOREIGN TRADE

Export Trade of Value to Business, But Manners and Customs of the Prospective Buyers Must Be Studied

IT may be stated in broad terms that an export department added to a business automatically acts as an insurance for home trade, and it is possible a very large proportion of manufacers and traders to introduce such a dertment into their business at small exnse with every prospect of satisfactory sults, provided they approach it intellintly," says Dr. Julius Klein, Director of e Bureau of Foreign and Domestic Comerce.

"The first thing a trader must consider which markets offer the best propects r his particular line. He must study e peculiarities, manners, and customs of e country he selects; he must remember at the people he wishes to cultivate are a different race, temperament, and probbly language; that they have different ays of thinking, different business methods, different laws, and in the majority of ases vastly different Custom House laws nd regulations. In short, in order to chieve the greatest success he must adapt imself and his tactics to his customers' deas, whims, and fancies. To him they may seem peculiar, but he must always emember that it is he who is the foreigner, ot they.

"A careful study of the markets is a necessary preliminary, and much valuable information can be obtained from the Custom House returns. Such study frequently results in a material saving of expense, since what will be keenly appreciated in one country will fall flat in another, and no amount of energy and push will ever render it successful.

"As an illustration of this may be mentioned a futile campaign of American manufacturers to market certain breakfast foods in South America. The cereals were lavishly advertised, house-to-house distributions of free samples made, demonstration booths were erected in stores, hotels, and clubs, where dishes were served without any charge in the most tempting styles to all willing to try them. Enormous sums were lost in this propaganda since the products failed to appeal to the public. The campaign was not confined to one country, but was prosecuted throughout practically the whole of Latin America, each country producing negative results.

"This illustration is well worthy of the attention of those contemplating adding an export department to their businesses, and conclusively proves the value and necessity of a careful study of the trade possibilities and requirements, as well as the impossible trade barriers which exist in every country.

"However, let it be assumed that the investigation made denotes the practicability of overseas trade in any line handled. By the addition of an export department a trader may materially add to his returns, and the greater the number of countries to which he can extend his operations the better in the long run.

"It is clear that an export department added to a business is a probable source of profit to the individual and a powerful factor in developing the country's trade. It will assist in keeping factories going, it will provide freights for our ships, it will help to keep labor employed and more contented, and, what is of greatest personal moment, will reduce business expenditures by materially adding to revenue. In a word, an export department added to a business, provided the goods dealt in are adapted to the trade, becomes a source of strength to the nation as well as of profit to the operator."

Trade With Latin America

The trade of the United States with Latin America for 1923, showing an increase of 25 per cent in exports to the Southern republics and 29 per cent in imports from those over 1922, reflects the healthy development of inter-American trade and should go far to dissipate the feeling prevalent in some quarters that American exporters are not "holding their own" in Latin-American markets, according to Dr. Julius Klein, Director of the Bureau of Foreign and Domestic Commerce.

Total trade for the year with Latin America (excluding Porto Rico and the Virgin Islands) amounted to $1,743,919,000. Of this, $693,627,000 were exports, which shows an increase in value of 115 per cent over 1913-14, whereas our exports to the rest of the world gained 68⅓ per cent. Imports from Latin America of $1,050,292,000 represented generally, not only greater quantities, but better prices for our purchases in that region.

U. S. Investment in Latin America

Six hundred and ten million American dollars are invested in Latin American public securities, according to estimates by the Finance Division of the Department of Commerce, and $3,150,000,000 more in Latin American industries. Besides this great amount we did a trade with Latin America last year (1923) amounting to $1,844,000,000 affecting directly and indirectly a great number of persons engaged in industry and business in the United States.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

BELGIUM—9920, cushion springs; hardware, automobile body; 9957, paraffine, pure, for match-making.

CANADA—9901, hosiery, silk and cotton, for men and women; neckties; shirts.

CHILE—9913, photograph supplies.

CHINA—9956, paraffine for candle making; wire, nail, white, cast in long veins.

CZECHOSLOVAKIA—9910, letters, metal.

ENGLAND—9900, undershirts, army.

FRANCE—9953, hops, Oregon.

GERMANY—9918, automobiles, $800 to $1,200; 9939, bacon; 9943, canned corned beef; canned salmon; 9912, canned goods; 9944, Douglas fir; 9912, flour; 9943, flour; fruits, canned and dried; 9947, fruits, canned and dried; 9943, lard; 9939, lard; 9944, oak; southern yellow pine; 9912, toilet; 9944, walnut; 9912, bath tubs; 9898, cotton, full and good middling.

SWITZERLAND—9927, barber chairs; 9906, jute; 9927, towel heaters.

SALES MANAGEMENT

College Graduates Make Fine Material for Salesmen If Properly Trained—Executives Responsible for Success

THOUSANDS of young men in all parts of the country are rapidly approaching the day when they will be handed their "sheepskins" and they will pass from the cloistered halls of learning to the busy world of industry. What are they going to do? They will be scattered about in all lines of business, but many hundreds of them will enter the selling field.

There are a number of big concerns about the country that make it a practice to select a few "graduates" and put them on the sales force, after some inside training. It has been found that about one-half of these men make good and become valuable members of the sales organizations.

That first jump from college life to the daily battle for the elusive order is a big one; it is full of all sorts of trouble and possibilities.

The first few days, weeks and months of a young man's life as a cub salesman are of the greatest importance to both him and the company training him. This question of training is receiving far more consideration these days than it formerly did. The sales manager of today is anxious to get these young fellows into the salesmen's class as fast as possible, and the greatest care and thought is being given to this work.

Using cubs on the sales force has many advantages. Young men just out of college are, many of them, going to make good for somebody and it might just as well be for the house with which they start. But the sales manager is largely responsible for their success or failure.

If they are kept on starvation wages and given only trivial work, the most ambitious young salesmen will leave just about the time the chief thinks they should be producing for him. He must realize they can't pay the butcher and tailor by saying that they work for the famous house of Blank & Company.

The chief who puts on young men to be trained in salesmenship must show them along which lines their future development lies. He should find out what each most wants to accomplish and then help him in that desire.

The three first points in management are men, methods and morale.

Almert Talks on "Normalcy"

Harold Almert, Consulting Engineer, Chicago, in a recent address before the Executives' Club of Chicago on "Normalcy," declared that a lack of understanding of the radical changes that have occurred in our economic structure is the cause for most of the discontent evidenced by all classes.

"Every man or woman engaged in gainful occupation expects to increase his or her earning power as the years go by," he said. "The universal error made is that people measure their improvement by their increase in gross earning power instead of their net and here is why they become discontented. Because, when they have applied their earnings to the higher levels of living costs and recreation, they are little if any better off than they were with much lower income ten or more years ago.

"Each class or trade that has demanded and received increased compensation for service fails to realize that such increase indirectly affects and increases the costs of every other class.

"Every man says, 'I am sick and tired of these high prices and I insist that we return to lower levels,' and then he says to himself, 'I am not going to make the sacrifice until everyone else has done so and then, maybe, I won't have to.' Every class expects or demands that the others take the lead and make the sacrifice first, therefore, we get nowhere.

"There is a solution, however, without reduction of wages and, that is, by removal of all artificial restrictions on output and voluntary increase of individual per capita output. By doing more work and producing more goods for present wages.

"If we are content to become a self-producing and consuming nation, we can readily adjust prices of commodities and wages at present levels but to grow we need foreign trade and, if we expect to compete successfully for a larger volume of foreign trade, we must reduce our wage and commodity price levels."

The Real Salesman

Has a steady eye, a steady tongue and steady habits.

He understands men and can make himself understood by men.

He turns up with a smile and still smiles if he is turned down.

He strives to outthink the buyer rather than to outtalk him.

He is silent when he has nothing to say and silent when the prospect has something to say.

He takes a firm interest in his firm's interest.

He knows that he is looking out for his own interests by looking out for his prospect's interests.

He keeps his word, his temper and his friends.

He wins respect by being respectable and respectful.

He can be courteous in the face of discourtesy.

He has self-confidence but does not show it.

He laughs at a little run of bad luck, and sees to it that he never has another through his own fault.

He knows that he cannot expect to sell every prospect, but that he can come very near to selling every one.

He has no habit that can possibly make his presence at all offensive to the most particular prospect.

He avoids discussion of the merits of a competitor, politics or religion.

He is a thorough gentleman—first, last and all the time.

Follow Local Regulations; Make Foreign Travel Easy

Considerable trouble and loss of time will be avoided by American travelers, especially those traveling on business, if the various local regulations of European cities with regard to the registration of arrival and departure of visitors are observed, says the Department of Commerce. Most of the municipalities in Germany, for instance, require that a traveler register with the local authorities the date of his arrival and the length of his visit, and business men traveling in Europe will find it advisable to acquaint themselves with such regulations when they arrive in a city.

These suggestions may be applied to Central European countries in general. Some of these countries do not require anything further than the usual visé, but it eliminates confusion if, on arrival at any new place, the traveler informs himself of the regulations covering the recording of arrival and departure.

Canadian Immigrants

The number of immigrants who entered Canada from England in 1923 was 35,783; from Scotland, 25,107; from Ireland, 8,231, and from Wales, 989. Newfoundland sent 5,140 immigrants to Canada, compared with 1,382 in 1922. From Finland there were 6,039 immigrants, and from Italy 6,062.

AUTOMOBILE—AVIATION

FINDING upon investigation that in 1922 automobiles valued at more than $100,000,000 were stolen, the Insurance Advisory Committee of the Chamber of Commerce of the United States has issued a report which will be presented at the insurance session of the annual meeting of the National Chamber in Cleveland on May 7, recommending that certification and registration of automobile titles become a part of the anti-theft legislation of all states:

The report says in part:

"Automobiles attract thieves because they are of comparatively large value, are easily obtained and in many cases may be disposed of with little risk. Their high degree of mobility, coupled at times with a disregard of precautionary measures by owners, tends to make their theft relatively easy. Many city streets are lined with parked cars which may range in value from a few hundred to several thousand dollars. As a majority of the various types of cars are practically standard as to general appearance it is not difficult for thieves to escape unnoticed with them, even though some may be of large value. The largest proportion of thefts, however, occurs among the lower priced cars.

"The United States affords a good market for second-hand cars. Through stories told by thieves, aided by fictitious or stolen bills of sale, there are many innocent purchasers of stolen cars. Some stolen machines not disposed of in this country are transported across the Canadian border and sold, while others are shipped to Europe and South America. Therefore the outstanding factors which aid in the distribution of stolen machines are first, the good market for second-hand cars, and second, the non-standard methods of transfer existing in many states.

"Automobile thefts may be divided into two general classes; first, those which are made solely for purposes of sale and second, those for individual use. In the former, recovery is more difficult because the thefts are generally committed by professional thieves who sometimes operate as bands or 'syndicates.'

"Theft syndicates have been known to exist in many of our larger cities. In fact some of them have been said to be international in character. They are formed for the purpose of stealing, disguising, transporting and selling automobiles.

"In order to place the burden of proof regarding ownership upon the possessor of the automobile, a number of states have passed so-called title certification or automobile anti-theft laws. The principal feature of the title certification law is that every car owner in the state must secure and possess a certificate of title proving his ownership of the vehicle in question. In order to register a motor vehicle for the purpose of securing a license, the owner in most states must show this certificate. In the event the car is resold, an assignment of title is made and the new title recorded by the Secretary of State or other official."

Hoepli Joins General Motors

The resignation of M. H. Hoepli, for more than a year Acting Chief of the Automotive Division of the U. S. Department of Commerce, has been announced. Effective May 1, Mr. Hoepli, will join the General Motors organization to assist in its European sales program. He will spend some time in the company's New York offices and Detroit plants before going abroad.

"Certified Accessories" for Olds

Certified accessories made especially to fit the new Oldsmobile Six are being supplied all authorized Oldsmobile dealers by the Olds Motor Works. The accessories are sold at a flat-rate net price, which includes all attachments. The accessories include bumpers, bar handled radiator caps, spot lights, windshield cleaners, rear view mirrors, step plates, trunks, trunk platforms and rails, windshield wings and sport tire carrier assemblies. All cars leaving the factory at Lansing are equipped with the proper holes, connections, etc., required to install any of the accessories.

Farm Tractor Demand Grows

A slowly growing demand for farm tractors is indicated by the recent importation from the United States of four gasoline tractors by the Colombia Sugar Company of Sincerin, Colombia. This importation, with three tractors previously imported by the Company, makes a total of seven tractors owned and operated by it. These machines are used principally for breaking up old sugar cane stubble and preparing the soil for replanting. The company in question owns or controls about 2,200 hectares (5,436 acres) of land which is planted in sugar cane.

Franklin's Inspection System

"The Franklin monthly inspection system, inaugurated two years ago, has been the means of placing in the hands of owners throughout the country a correct understanding of the conditions of their cars at all times," says F. J. Leyerle, Service Manager of the Franklin Automobile Company. "Particular attention is directed to the fact that in many instances a trifling expenditure will correct minor mechanical ailments, which, if allowed to run, would sooner or later develop into serious defects, resulting in a large repair bill."

nama Canal Traffic in 1923 Sets New High Mark

raffic through the Panama Canal in the r ended Dec. 31, 1923, exceeded that in previous year. Commercial vessels king the transit during the year numed 5,037, with an aggregate net tonnage 24,737,437, and carried 25,160,545 tons cargo. As compared with 1922, the nber of ships increased 68 per cent, nage 90 per cent, and cargo 84 per cent.

During 1923, vessels transiting the canal m the Atlantic to the Pacific numbered 14 compared with 2,323 from the Pac to the Atlantic. In the calendar year 22, Atlantic to Pacific transits numbered 30, and Pacific to Atlantic numbered 67.

Tolls collected in the year ended Dec. 1923, amounted to $22,966,838, an inase of 83 per cent over the preceding ar. Of this total, $11,534,023 was paid vessels in transit from the Atlantic to Pacific, and $11,432,816 on vessels sing from the Pacific to the Atlantic.

Farm Electrification

Construction of superpower plants and ablishment of larger power units by ergers are continuing as marked features industrial development. Back of all is is widespread demand for electricity farms.

Remarkable progress has been made in any states by private enterprise in extending electrical service to the farmers. California leads the world in number of farmers using electricity and in the low cost of service. Washington is probably second only to California as a geographical section, with 28,000 farms electrified.

Ontario, Canada, larger than any Western state, is serving only 13,500 farms under what is called public ownership.

Paper Exports Increase

Exports of paper and paper products from the United States during 1923 were valued at $25,677,685, or slightly more than one and $250,000 in excess of those for 1922, says the Department of Commerce. The difference was due to an increase in the average price obtained, rather than in quantity. Radical changes occurred not only in the relative importance of foreign markets but in the comparative demand for the various items. Owing probably to low prices quoted by European competitors, a substantial decrease is noted in exports from the United States to South America, as well as in the totals of such classes as newsprint, wrapping (other than kraft), paper bags, and the cheaper grades of writing paper. These decreases, however, were more than offset by increased shipments to the Far East and by gains in book paper and kraft and such specialties as boxes and cartons, paper and straw board, grease and waterproof papers, tissue and crepe papers, hanging paper, carbon paper, and wall board.

Over 1,500,000 Passengers Pass U. S. Seaports Yearly

An aggregate of more than 1,500,000 passengers moved through the ports of the United States in ocean-borne traffic during 1923, according to an analysis issued by the Shipping Board. Of this total the Port of New York alone handled more than one-half of passengers arriving or departing on ocean voyages, and more than 99 per cent of the country's total ocean-borne traffic passed through the gateways of New York, Seattle, Boston and San Francisco.

Electric Railway Expenditures

Electric railways expended approximately $282,000,000 last year in purchase of materials for maintenance, extensions and improvements, buying more new equipment than in any year since 1913. Estimated expenditures for 1924 will total $262,000,000. Over 16,000,000,000 passengers were carried in 1923, compared with 15,337,000,000 in 1922.

The total exports of wood and manufactures thereof from the United States during January, 1924, were valued at $8,100,756, compared with $5,748,574 for the same month last year, an increase of approximately 29 per cent, according to the Department of Commerce. For the seven months ending January, 1924, the total value of these exports amounted to $48,748,862.

*"The Field of Investment"—Two Important Sources of Capital Demand are Federal and State Governments

VI

By C. W. SILLS

Vice-President, Halsey, Stuart & Company, Chicago

As the sources of supply are many, so likewise are the demands for capital, and classification of them is sometimes difficult because circumstances may render lenders of capital likewise borrowers, and vice versa. I think it is sufficient to say that capital demands a rise out of the multifarious industrial, social, economic and civil activities of the world and, as with the sources of capital supply already mentioned, my classification will be confined to those sources of capital demand which are of the most importance and the most constant.

1. Government—The most striking example of the manner in which source of supply may become likewise and contemporaneously a source of demand is the United States Government in its operations during the war when it went to the people for tremendous amounts of capital which it, in turn, used to make advances to the Allies to bolster up and re-establish their credit in this country. I do not wish to burden you with figures and these I give will be in round numbers, but I do not believe we can have a comprehensive conception of the enormity of the Government's operations in this connection without some statistics as to the amounts of the loans made and debts contracted.

The pre-war debt of the United States, in the amount originally issued, was $972,000,000.

With the war came the five Liberty Loans, ranging in amounts from $2,000,000,000 to $7,000,000,000, or a total of original issue of over $21,400,000,000, representing an increase in the nation's indebtedness of about twenty-two times, exclusive of other forms of Government borrowing at this time as evidenced by notes, certificates, and stamps. However, the five years subsequent to the war have seen a substantial decrease in the National interest bearing debt of the Government which, at the present time, all told is approximately $21,700,000,000.

I stated above that the United States Government was likewise a lender of capital. From the proceeds of the Liberty Loans, the Government advanced over $9,800,000,000 to the Allies. In addition, from the sale of surplus war materials to foreign countries, the Government is owed almost $600,000,000, and for relief supplies furnished by the American Relief Administration and for the sale of flour by the United States Grain Corporation, is owed an additional amount in excess of $160,000,000. The total principal amount of the obligations of foreign governments, representing nineteen different countries, held by the United States Treasury to secure loans made to them, including interest accrued or unpaid, is in excess of $11,800,000,000.

The Market for the Week Ending April 19

	High	Low	Last	Net Change
20 active rails .	81.64	80.55	81.55	+ .17
20 active industrials . . .	91.34	89.91	91.13	+ .35
20 active coppers	24.09	23.40	24.02	+ .36
40 active bonds	88.01	87.90	87.98	— .14
Chicago May wheat . . .	104¾	101¼	104¾	+ 2½
Chicago May corn	79⅛	76½	78⅝	+ 1⅛
New York May. cotton . . .	30.88	29.61	30.35	— .81
New York call money . . .	4½%	4%	4%	— ¼%
New York com'l paper	4¾	4½	4¾@4½	..
Sterling exchange . . .	4.38	4.83⅜	4.38	+.04½

The Government has likewise been active in the domestic field. As of June 30, 1923, the United States Government held obligations to secure advances made to domestic corporations in excess of $500,000,000, the largest of which represented advances made to the railroads totaling over $330,000,000.

2. States, counties and municipalities—The capital demands of states, counties, municipalities and tax districts, while of course not comparable to that of the Government, have in recent years assumed very large proportions. This has been largely due to the Federal income tax, rendering the bonds of these bodies totally exempt from income taxes and creating for them an artificial demand which made possible the raising of money very cheaply. The relatively low cost of money and the ease with which it could be raised through the sale of municipal obligations, has resulted in a countrywide era of civic improvements. During the year 1922 over $1,000,000,000 of municipal bonds were disposed of in the United States, and if to this total were added the various short time tax-anticipation securities issued by municipalities, together with the Canadian bonds and the bonds of the United States sold in this country, the aggregate amount of such obligations would approximate nearly $[illegible],000,000,000. It is interesting to note that almost $350,000,000 of municipal bonds issued in 1922 were for the purpose of building or improving streets, roads and bridges, constituting 31 per cent of the total, and that over $230,000,000 or 21 per cent were for the purpose of building or improving schools. There is also an item "Miscellaneous," in the municipal statement which shows that over $100,000,000 of bonds were issued for such purposes as flood prevention, harbor and water front improvement, rapid transit, ferries and canals, irrigation, drainage, etc. It is estimated that the present gross indebtedness of all states, counties and municipalities of the country approximates nearly $[illegible],000,000,000 or nearly one-half of the total interest bearing debt of the United States Government.

(To be continued)

(*Copyright 1924 by the American Bankers' Association of America.)

Chino-American Bank in Amoy

The American-Oriental Bank of Fukien, Foochow, China, will shortly open a branch in Amoy, the State Department reports. The majority of the stock is held by the Raven Trust Company, an American company in Shanghai, and the balance by Chinese, presumably in the proportion of 52 per cent American to 48 per cent Chinese. The capital of the American-Oriental Bank of Fukien is set at gold $1,000,000 with a fixed exchange rate for capital stock of Mexican $2 for $1 gold.

Savings Deposits Increase

Statistics of 876 banks distributed throughout the United States, the Federal Reserve Board reports, showed savings deposits amounting to $6,972,418,000 on March 1, as compared with $6,910,460,000 on Feb. 1, and $6,441,405,000 on March 1, 1923. This represents an increase of nearly 1 per cent during the month and about 8 per cent during the year ended March 1, 1924.

Textiles to Latin America

Exports of American textiles to Latin America and the West Indies totaled $98,289,895 in 1923 compared with $84,288,950 in 1922, an increase of 16. 6 per cent. Total sales of American textiles and fibers to all countries aggregated $1,002,041,446 in 1923, of which raw cotton constituted $807,102,507.

ne three banks which have erected this t structure will occupy all the space n the sub-basement to the fourth floor. Illinois Merchants Trust Company, as merged state banks are now known, dles the savings, farm loan, bond, trust foreign business, while the Illinois chants Trust and the Corn Exchange ional will both do a commercial busi- s. The mezzanine floor will contain the es for the executives and the Credit De- tment. The first floor, on the street el, will house the savings, farm loan, id and foreign departments. The Trust partment will be on the third floor, and the fourth floor half of the space is to used for the Legal Department and ious working sections of the bank.

40,000 Safety Deposit Boxes

In the first basement are the safety de- sit boxes—40,000 of them—the largest mber of safety deposit boxes under one roof West of New York. The huge vaults for the banks will also be located here.

In the sub-basement will be the operating machinery for the building—boilers, heating and ventilating apparatus, elevator motors, etc.

Each of the three banks thus united has had a long and honorable career in the upbuilding of Chicago and Western financial interests. In point of age, the Merchants Loan & Trust Company is the eldest, having been launched June 10, 1857, with many of Chicago's most famous pioneer business men on its roster of organization. There were twenty-seven other banks in Chicago at that time; today it is the sole survivor, all the rest are gone.

The Illinois Trust & Savings Bank came along about a generation later. It began business in 1869 as the Sterling Bank of Sterling, Ill., but in 1873 the stockholders voted to remove to Chicago and to change its name to the Illinois Trust & Savings Bank. It opened for business in Chicago on June 2, 1873. Four months later John J. Mitchell, whose father was a director and large stockholder, entered the employ of the bank as a messenger at $12 a week. In 1880, at 26 years of age, he was elected President, and today he is the President of the merged Illinois Merchants Trust Company.

The Corn Exchange National Bank came along a few years after the Illinois Trust & Savings Bank had opened in Chicago. It was organized by Benjamin P. Hutchinson on Sept. 6, 1879, and has gained its principal fame as a financial institution by more than fifty years of centralized effort to serve the business welfare of Chicago and its trade territory. The present building of the Corn Exchange National, opened in August, 1908, has been sold to the newly merged National Bank of the Republic and the National City Bank of Chicago, which will move into it when the Corn Exchange moves out in the near future.

Mitchell Heads Merged Banks

The presidents of these three banks—Edmund D. Hulbert of the Merchants Loan & Trust, John J. Mitchell of the Illinois Trust & Savings and Ernest A. Hamill of the Corn Exchange National—were all active in the work of unifying these institutions under one roof. John J. Mitchell was elected Chairman of the Board and Mr. Hulbert the first President of the Illinois Merchants Trust Company, but Mr. Hulbert died before the merged state banks moved into their new quarters. Thereupon John J. Mitchell was elected President in his stead, relinquishing his office as Chairman of the Board. Mr. Hamill is now Chairman of the Board of the Illinois Merchants Trust Company and President of the Corn Exchange National.

Orders received by the General Electric Company for the three months ending March 31 total $73,487,903, Gerard Swope, President, announced. This is a decrease of 8 per cent over the first quarter of 1923, when order totalled $80,010,045.

Limitless

No other word applies adequately to the facilities of this organization to serve manufacturers who use wood in making or shipping their products.

In our Chicago yard of 45 acres are piled thousands upon thousands of feet of all kinds of crating lumber.

Your phone call will start your order towards your factory today.

Just as promptly can we furnish maple, oak and yellow pine flooring, heavy timbers, piling, or any wood you need in the production of your goods, in any size or amount.

In Chicago and suburbs a system of twenty branch yards, ably managed and adequately stocked, means quick deliveries and lower delivery costs.

Phone us, wire us, write us for anything any time. Insure your service to customers by having unlimited service for yourself.

What Italians Have Done In Upbuilding of the U. S.

(Continued from page 8)

come to the United States in large numbers prior to 1880, instead of since that year, they would have settled in the North Central states, as did the Germans and Norwegians and Danes and Swedes. One can be almost equally certain that if the so-called English speaking races had migrated to the United States since 1880, instead of more largely before that year, they would now be found principally in the manufacturing and industrial centers of the North Atlantic division." The truth of this statement is further demonstrated by the fact that where the development in recent times has been largely agricultural, as in California, Italians have flocked in great numbers, and have contributed to it.

Italians Who Love the Soil

Moreover, it is a mistake to believe that Italian labor is all engaged in industrial work. An inquiry recently conducted by the Committee on Agriculture of the Chicago Italian Chamber of Commerce, although far from complete through lack of funds, brought out the fact that there are in Illinois at least 200 farmers of Italian birth or extraction owning their land, and if such an inquiry could thoroughly be made in all states it would undoubtedly be found that there are thousands upon thousands of people of that race in agricultural pursuits. There are Italian agricultural settlements at Daphne, Ala.; Lambert, Ala.; Valdese, N. C.; Sunny Side, Ark.; Tonitown, Ark,; Knobview, Ark.; Independence, Miss.; Kenter, La.; Hanson, La., and other places. The large model Wisconsin farm owned by Count Giulio Bolognesi, formerly Italian Consul General at Chicago, on which farming is conducted according to the most modern, scientific methods, is a notable enterprise in this line.

Official, reliable, impartial, statistics prove the Italian immigrant to be a sane, sober, industrious law-abiding self-supporting individual. His intelligence and intuition are witnessed to by his employers. It may take him some time to learn the language of this country, but his children often speak no other. He may be illiterate, perhaps, but they attend our schools. When he becomes prosperous he does not neglect their higher education; witness the large number of students of Italian blood in our colleges and universities, particularly in the East. He does not waste his money on moonshine, but saves it; some of it may go towards the support of his old mother in his native country, but most of it, by far, stays here, and is largely invested in real estate. When his country—America—needs it he takes it from the bank, or digs it out of that old stocking, and produces it. His contribution to the various Liberty and Victory Loans was nearly $1,000,000,000. He has all the elements of valuable American citizenship. The worst that may be said against him is that, in the past, he has not acquired it as fast as some other foreign-born. This is not because he does not love our institutions, but for other reasons, as the difficulty of learning the language of this country. And in 1923 nearly 29,000 Italians became naturalized, a larger number than of any other nationality.

(To be continued)

Production of Explosives Reaches New High Record

The production of permissible explosives in the United States in 1923 amounted to 60,371,314 pounds and constituted a new high record, according to statistics compiled by the Bureau of Mines, U. S. Department of the Interior. The previous high record in the production of this type of explosives was made in 1920, when the output was almost 54,000,000 pounds. Permissible explosives are those which have passed certain tests prescribed by the Bureau of Mines to determine their safety for use in gaseous and dusty coal mines, and the Bureau considers the increased use of permissibles as an important development in mine-safety work.

Of high explosives other than permissible, 267,405,220 pounds were produced in 1923, this figure also constituting a new high record, exceeding by 7,000,000 pounds the previous record set in 1917.

The production of black blasting powder in 1923 is reported as 8,078,053 kegs, or 201,951,325 pounds.

Don't let profits seep away

WHEN analysis detects buying wastes, and production records disclose operating losses, then a plant is operating efficiently—in every department where these yard-sticks are applied. But unfortunately the same careful methods are not always applied to steam production.

Republic engineers, working in collaboration with prominent cost accountants have developed a series of forms for determining the cost of generating steam and recording the amounts used in departmental processes. The records of Republic power plant measurement instruments as interpreted by these forms point out waste, indicate savings and provide a sound basis for the formation of equipment and material purchasing policies.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

HILE the total output of electrical energy by the public utility power ts of the United States in 1923 in- ed 17 per cent over the 1922 figures— gh record of nearly 56,000,000,000 vatt-hours—the proportion of this mous flow of power produced by hy- electric stations continued a decrease has appeared for each of the last five s, according to figures made public by United States Geological Survey.

he total power production and the pro- ion supplied from water-power plants e 1919 is as follows:

Total Kilowatt-hours	Percentage by Water Power
919—38,921,000,000	37.5
920—43,565,000,000	37.1
921—40,976,000,000	36.5
922—47,625,000,000	36.1
923—55,928,000,000	35.1

he more rapid increase in the produc- n of power by steam plants as compared hydro-electric central stations is due to greater ease in locating a steam plant, ereas a hydro-electric power site is often ong distance away from its market for wer. This is important when it is noted t large modern steam plants can, and do, oduce and sell power at as low cost as es for hydro-electricity transmitted from plant seventy-five or a hundred miles ay. Furthermore, the steam plant can built more quickly and cheaply than the ter power plant.

The demands for electrical energy are owing at such a rate that, according to a atement made by the director of the Geo- gical Survey, even if all the water power tes east of the Mississippi River were de- loped, they could not supply the energy quired.

Water power development is of the great- t economic importance as every horse- ower so generated saves at least four tons f coal a year. But almost every hydro- lectric plant is subject to drought and w water, ice and other interferences, and ust have steam-power to fall back upon n emergencies. The steam plant runs year n and year out, when and as it is needed.

Commonwealth Edison Year Book

Commonwealth Edison Company's taxes nd municipal compensation in 1923 to- alled $5,699,584, or $310,582 more than was paid the 34,256 stockholders in divi- dends. The amount was the equivalent of 11.6 cents of each dollar the Company received for electric light and power serv- ices from its 688,155 customers, according o the annual Year Book of the Company, which was recently sent to stockholders. Among the other items of public interest disclosed are:

The Company generated 2,573,286,700 kilowatt-hours of electricity, the greatest volume of any steam electricity producing company.

It established two world's records—the largest generating capacity and the largest maximum load of any single company.

Electricity produced would have been sufficient to cause a 60-watt lamp to burn 42,888,116,666 hours, or 4,895,900 years.

Coal consumed averaged 2.23 pounds per kilowatt-hour, compared with 2.87 pounds ten years ago; this represented a saving of .64 of a pound per kilowatt-hour, or the equivalent of 823,400 tons.

Stockholders totalled 34,256, an increase of 8,915 for 1923; of these 85.2 per cent live in Chicago, 8.8 per cent in Illinois outside of Chicago, and 6 per cent outside the state. One out of every three employes is a stockholder.

There were in service at the end of 1923, 3,500 miles of underground cable, 8,500 miles of overhead lines and 24,000 miles of "service" drops.

It is revealed that in 1893—World's Fair time—there were 4,452 homes, stores and factories in Chicago using electricity, compared with 688,155 at the close of 1923. The electricity used on the World's Fair grounds was greater than that used in the rest of the city combined.

"Hello" Becoming Obsolete

The familiar "Hello" is by degrees dying out in telephone practice. More and more telephone users are injecting personality into their salutations and answering "Mr. So-and-So speaking."

When Bell was making his early experiments he used the word "Ahoy" but "Hello" superseded it when the telephone got into practical use.

The word "Hello" originated in England, when wolf-hunting was the favorite sport of the gentry. French was the language of the court at that time so the wolf-hunters used the cry of the French hunter which was "Auloup!" meaning, to the wolf. This call heard from a distance sounded like "a-loo," but the English who always add the "H" sound to every possible word, shouted back "haloo."

"TR" Motor Wins Contest

The Triumph Electric Company of Cincinnati, O., builders of electric motors, have recently made some interesting tests of their "TR" motor which are of unusual interest to those using motors for power. This Company hooked up a 10 horse power "TR" motor with a 25 horse power motor of squirrel cage type, and the "TR" won. The "TR" motor is a self-starting polyphase induction motor, requiring no compensator when heavy loads are to be started, as the starting current is automatically controlled.

Telephone Your Mother On Her Birthday

A LONG DISTANCE CALL to your mother on her birthday may mean more to her than the most elaborate gift. Mother loves to hear the cheery voices of her sons and daughters and to know that they have not forgotten her.

To have you with her on her birthday would be your mother's greatest joy, but if circumstances and distance forbid a visit, then call her by long distance telephone and let her hear your voice.

British South African Railways

In spite of unfavorable economic conditions prevailing in the early part of 1923, the railways of the Union of South Africa had a fairly successful year according to an analysis of the annual report of their General Manager, by the Transportation Division of the Department of Commerce. Compared with the previous year gains are shown in the carriage of passengers and freight, although the gross earnings from these sources were lower, due in some measure to reduction in freight rates on basic commodities. The railways had a total open trackage of 10,986 miles, while the total mileage operated by the administration was 11,628.

During the year, 61,582,447 passengers were carried, an increase of 25 per cent over the previous year. Revenue freight traffic carried amounted to 15,718,864 net tons, or an increase of 3.27 per cent. Coal made up the greater part of the traffic, over 8,000,000 tons of this commodity having been hauled. The gross earnings amounted to $89,250,311, or approximately $8,125 per open mile of line. Compared with the previous year, this was a decrease of 3.17 per cent.

FOR SALE
Complete Woodworking Plant
and
Retail Lumber Business

Thoroughly equipped, with up-to-date machinery to do all kinds of hardwood trim and mill-work, frames, sash, doors, etc., for dwellings and stores. Employing best of men, and good line of customers. Dry Kiln and Private Siding. Annual business $475,000.00. Established 23 years. Plant and stock can be purchased at right price. No Brokers.

KENTUCKY UTILITIES COMPANY

7% Junior Cumulative Preferred Shares

IN the new Junior Preferred shares of the Kentucky Utilities Company investors have an opportunity to acquire part-ownership in one of the country's strongest public utility companies on an unusual basis. The shares—$50 par value—are offered at $48, and can be purchased over a period of time for $4 per share monthly.

Here is a convenient way to add to your public utility holdings at little cost.

Parents will welcome this chance to help their boys and girls build up a dividend-paying public utility investment. Many young patrons of our Junior Department are now laying aside $1 weekly with this end in view.

The Kentucky Utilities Company is an important part of the electric power system that extends from northern Wisconsin south through Illinois, Indiana and Kentucky into Virginia and Tennessee. The great generating station near Pineville, Ky., pictured above, is the newest addition to the company's facilities for electric power production.

Dividends on this issue are at the rate of 7% per annum; they are payable quarterly by check.

Made-to-Order INDUSTRIAL BUILDINGS

It is better to build, rather than to purchase a plant ready made. ❧ It is cheaper. ❧ A factory or warehouse constructed for someone else, requires considerable remodeling to meet your needs; even then it may not turn out satisfactorily. ❧ But when you order a *Central Manufacturing District* plant made-to-measure, you are assured of getting just what you want, when you want it, and at the lowest cost. ❧ We are organized to build factories that suit. ❧ All our plants are on private Chicago Junction switchtracks, assuring efficient freight service. ❧ We finance building. ❧ We will handle everything for you — land (purchase or rental), building plans, and construction. ❧ That is our business.

AN ANNOUNCEMENT

WITH this issue, MANUFACTURERS NEWS inaugurates a revised editorial policy. Opportunely enough, the revision coincides with two other important changes—appointment of Mr. John Bradford Main to the position of managing editor, and removal of our offices to new quarters in the Illinois Merchants Bank Building.

FOR more than twelve years, MANUFACTURERS NEWS has served the manufacturers of the Middle West. The quality of that service is best evidenced in the loyal confidence and esteem of our many friends. It is with a sense of our obligation to them—an obligation to deliver the *best* that is within our power—that MANUFACTURERS NEWS enters upon a forward-looking program of expansion.

AS in the past, articles of genuine helpfulness and merit will be the rule. Constructive criticism and other suggestions for the betterment of MANUFACTURERS NEWS will be welcomed.

TO all of our readers, we extend the invitation to make of our pages a medium for the exchange of news and ideas—news of themselves, of their plants, of their friends and of their projects; ideas such as may prove of interest or of assistance to other manufacturers throughout the Middle West.

IF YOU have ever run a "Help-Wanted" ad in a big daily newspaper, you know what a gamble one is compelled to take in trying, by this method, to pick a really competent man.

Assuming that the position you are trying to fill offers better-than-average pay, out of the scores, even hundreds, who apply, only a small minority are really qualified.

Your time is valuable—yet you must waste hours just in sifting out the incompetents. Only when you have reduced the mob of eager applicants to a handful of picked men can you really begin to make a choice.

Recognizing the enormous amount of time and energy wasted in this dragnet method of hiring men, many of the finest concerns in America are wisely shifting the burden of primary selection to the Placement Department of LaSalle Extension University. Thus, as each need arises, instead of having to consider hundreds of "unknown quantities," they interview two or three applicants only—men whose qualifications are *known*, whose records are *proven*, who bear the recommendation of LaSalle Extension University. Here are five reasons why these big employers, a few of whom are listed on this page, find this service profitable:

(1) The requirements of a given position receive individual, personal attention;
(2) Only applicants trained for the particular type of work which the position calls for are recommended;
(3) Careful **primary** selection is made by employment experts of the Placement Department. An employer has to interview only the two or three "best bets";
(4) The service of the Placement Department is free—both to employer and applicant;
(5) The employer saves the cost of advertising; the employee saves the worry connected with the payment of a big employment fee.

Next time you need a good man—quick—drop a note to the LaSalle Placement Department—or—call Boulevard 8400. You will find in this service a real short cut to satisfaction.

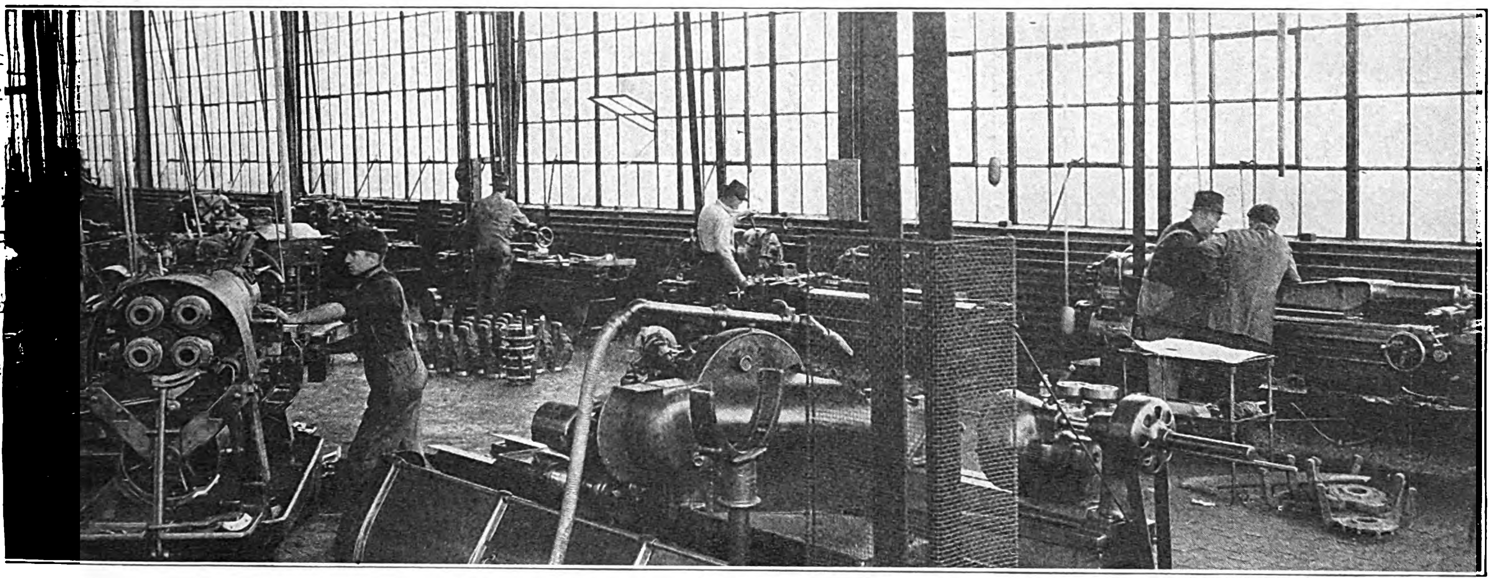
THE "OLD TIMER"



Copyrighted by Underwood & Underwood.

By J. K. NOVINS

NOTE: This is the first of Mr. Novins' series, "A Training Program for the Factory Foreman," of which there are twelve rticles in all.

Preparation of this series involved not only an extensive study f training systems, but also an exhaustive survey of production problems, welfare activities, profit sharing and stock ownership plans and job analysis. All of these angles were studied by Mr. Novins at first hand in operation in various plants, as well as by consultation of the records of investigations heretofore conducted by various personnel organizations throughout the country.

The result is an invaluable contribution to every manufacurer's files, the more worth while in that it presents a clear and full exposition of the subject of foreman training briefly, concisely and constructively.

"The 'Old Timer'" deals with just that—the veteran foreman who must be adapted to modern methods of plant operation, and who, unfortunately, often cannot be made to see the light. It is a graphic study of one of the biggest problems of personnel management. Next week's article, "The Melting Pot," surveys briefly the program of training essential to the solution of that problem.

—EDITOR.

JOHN B. was a foreman in a small plant, a good old conservative production organization. He entered the organization as an apprentice and had risen to his present position by hard work. He knew the name of every workman, and the men respected him because he was one of them. He knew the workings of every bit of machinery, and he could always lend a hand to the workman struggling with an especially intricate operation. An operator was slow in his work. John B. would have a little friendly talk and then perform the operation himself, just to show the fellow how he could speed up the operation. The talk and the demonstration took at least a half hour of the foreman's valuable time. Consequently, John B. was a very busy man at least ten hours a day. He was the first man on the job, and the last to leave the factory.

The owners agreed John B. was the best foreman they ever had. Increased production atoned for his leniency with the men. They never feared labor trouble as long as John B. was on the ground to straighten matters. On several occasions John B. actually settled incipient walkouts. Indeed, a valuable all-round man!

Then fate stepped in and waved a danger signal. John B. did not heed it, and as a result he is no longer with the same firm. He has had to start all over again, in a smaller plant, at a smaller salary. But for all that he is a wiser man today.

It is estimated that the manufacturing establishments in the United States employ nearly 900,000 factory executives. A good many of these are either foremen or sub-foremen. Until recently John B. was one of them. What happened to John B. ought to be of strong interest to every one of the 900,000.

This is what happened:

Quite unexpectedly to John B. the small, conservative plant began to boom. Additional capitalization and a strong sales campaign resulted in a deluge of orders.

For a time the plant ran along on its usual quota of production. Then despite an increase in the working force, orders began to pile up. There were hasty conferences among the men high up. Soon an industrial engineer appeared on the scene. He conducted painstaking detail studies of the various operations in productions.

In due time the factory was reorganized. Operations were simplified. A change in personnel was affected. An employment manager was secured to take care of the hiring of workers and the maintaining of their esprit de corps. A modern storeroom was installed, with a trained man as storekeeper. The foreman was deprived of the work of hiring and firing and that of attending to the storing of tools and material. By filing certain blanks and

What's Happening to LEATHER

An Interview with JOHN E. WILDER

WHAT is the matter with the leather business?

With losses amounting to millions of dollars every year since 1920, with disquieting financial statements from every large producing leather house in the country, what is the future for the industry?

To John E. Wilder, president of Wilder and Company, one of the oldest leather merchants in Chicago, the future looks gloomy. But there is, he says, a ray of hope "if the public, especially the women, will return to sanity." The chief reasons for the toboggan slide taken by the leather industry, as seen by Mr. Wilder, are—

WHAT'S HAPPENING

Copyrighted by Underwood & Underwood.

First, women's filigreed, lattice work, low shoes, consisting principally of soles. Demand by girls for shoes of snake skin, shark skin, lizard skin and baby aligator hides, not to mention black satin and other fabrics for footwear.

Second, men's oxfords worn the year around, each pair resulting in a loss of approximately one foot of leather.

Third, automobiles and improved transportation facilities which have caused walking to become almost a lost art.

Fourth, surplus of army brogans which are found by the millions in army stores throughout the country and are popular with working people.

Fifth, rubber heels which annually take the place of five million sides of leather in this country.

"There is something pathetic about the demoralization of the great leather industry," says Mr. Wilder.

"A combination of circumstances over which the leather manufacturers have absolutely no control has forced the prices of leather down at least one third. Some grades which were selling at fourteen cents a pound are now selling at seven cents a pound and no business can stand this for any length of time. As a result, many concerns are going out of business.

"During the war the shoe style committee, of which I was a member, limited the shades of leather which could be produced for shoes to light and dark tan, black and white, and there was little or no complaint because the people realized there was a shortage of leather.

"Everybody knows what happened in 1919. There was a saturnalia of buying of all classes of goods. Everybody had money and everybody bought enormously. Leather went up over 100 per cent and the tanneries and leather factories which extended their facilities during the war were taxed to their capacity.

"Then came the slump. We thought it would be over in 1921, but it continued and it is still with us in 1924, although we are hopeful that the bottom has at last been reached. Millions of dollars were wiped out by depreciated inventories.

"One of the principal reasons for the falling off in the leather business is the modern millinery shoe which has been adopted by our women folk. High shoes have been abandoned by the women. It is almost impossible to find a pair. Winter as well as summer the women wear low shoes and during the last year or two they have adopted a style which is almost equivalent to no shoes at all.

"The shoes which are popular among our niftiest women dressers are as near an approach to the sandals of ancient Greece, Rome and Egypt as modern styles will permit. The discovery of King Tut's tomb is responsible to a large degree.

"Where the shoes are not sandalized they are conspicuous for their filigree or lattice work, exposing the greater portion of the hose. No women would have thought of wearing such shoes a few years ago. They certainly are not healthful, but I am afraid the argument of health will not be effective.

"They may be more susceptible, however, to the argument that the sandal causes a spreading of the feet and it has already been observed that the feet of American women are already several sizes larger than they were a few years ago. It is obvious that wearing no shoes at all, which is practically what our women are now doing will cause the feet to spread materially.

"It has been suggested that styles perhaps will change. It has been pointed out that a few years ago women were wearing boots, probably due to the style influence of a Hungarian Comic Opera where all the girls wore high Russian boots. It is true that styles change. But it is my belief that present vogues are, in some way, hooked up with the short skirt, bobbed hair and jazz tendencies of modern life.

"But to return to things detrimental to the leather business:

"There is a big demand in higher class shoes for snake skin, lizard skin, shark skin, baby aligator hides and so on, and the makers of those leathers are profiting by the fashion.

"The fashion of men wearing oxfords the year around has a good deal to do with lessening the demand for leather. Formerly oxfords were worn only during the warm summer months, but with the advent of woolen hose they are worn from January to December. Spats take the place of uppers during intensely cold weather. At least a foot of leather is lost to the leather manufacturers on every oxford shoe and when you take this into consideration plus the losses being suffered in women's shoes, the amount of lost business is enormous.

"Rubber heels have administered a solar plexus blow to the leather market. They are almost universally used and have caused a loss of about five million sides of leather which formerly went

Continued on Page 30

GONE WEST

By CALEB ENIX

THREE years ago, a group of Chicagoans stood upon a figurative hilltop and, looking about them, beheld great streams of wealth and energy flowing from all directions to, and to all directions from, a common center. A proud scene, it represented the work of less . two decades yet comprehended the principal sources of the ld's subsistence—food, household supplies, farm implements, hinery of every description, as well as many luxuries.

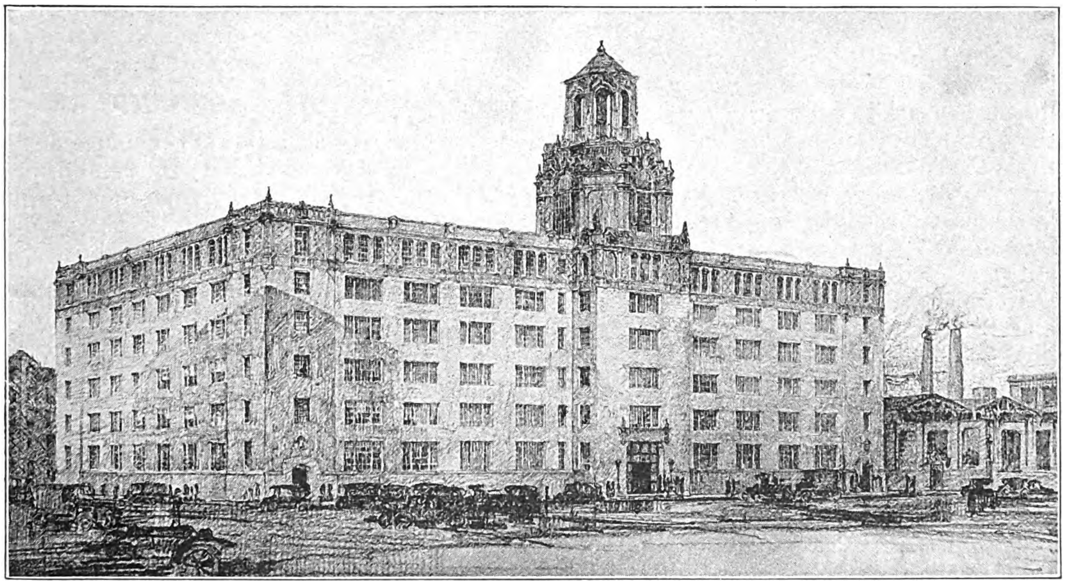
It was the Central Manufacturing District of Chicago.

Now these men, who had created and helped to build up this munity of industrial interests, were in search of adventure. l-West capital and that of the East were crying for new opportities—for expansion. And these industrial builders had behe imbued with the spirit of the demand.

The well-worn phrase—"Go West"—appealed, not for any timental rea-, but purely good business ise. The en- e West was in- ected and sur- yed, and con- tions in every cality of prom- were scientif- ally analyzed.

A thorough nvass finally e choice upon os Angeles, Cal- ornia. The re- lt is the Central anufac- uring District of os Angeles, not et two years old ut fast becoming a wonder of merican indus- y.

A TYPICAL BUILDING



This new industrial center not only has been formed on the principle of the entral Manufacturing District of Chicago, but is under identical upervision. The men in charge are John A. Spoor, Arthur G. eonard, E. V. R. Thayer and H. E. Poronto.

There were several reasons why Los Angeles was chosen.

The city is the western terminus of three transcontinental ailroads, the Union Pacific, the Santa Fe and the Southern Paific. It is likewise the terminus of the Pacific Electric Railway, aid to be the most extensive system of electrified lines in the world. These four lines have yardage sufficient to accomodate nore than 25,500 cars.

The "U-P" Santa Fe and "Southern" give the Los Angeles manufacturer the facilities to pierce the eastern, northern and southern sections of the country, while the Pacific Electric furnishes easy communication with all important points along the coast to the South. This road operates to all important points of Southern California over a network of more than 1,200 miles of tracks.

Within a radius of 300 miles of Los Angeles are oil wells producing to the tune of $400,000,000 annually. In the same area are abundant deposits of coal, salt, soda, potash, sulpher, gypsum, lime, sand, silica, marble, magnesia, graphite, iron, tungsten, vanadium, platinum, copper, lead and zinc. Fertile fields of cotton, rice, sugar beets and vegetables are found throughout the locality, together with orchards, nut groves and timber.

In addition, obtainable oversea at low cost, are the products of the tropics and antipodes, providing a rare abundance of raw stuffs of almost limitless variety. Among such products, obtainable at much lower cost here than in rival manufacturing centers, are Malayan tin, Australian wool and hides, East Indian spices, Ceylon teas, Brazilian coffees, Chinese silks, Central American hemp and sugar, licorice, and Amazonian hardwood, minerals, rattan, tapioca, cocoa, crude drugs, camphor, beans, peanuts and jute.

Adjoining the Manufacturing District is the Los Angeles Stockyards, a related enterprise, where manufacturers may obtain whatever is needed in the way of animal by-products.

Los Angeles harbor provides a remarkable avenue for commerce, not only with Pacific Coast ports and the Orient, but, by use of the Panama Canal, with the whole of South and Central America.

Labor conditions are good, and appealed especially to the founders of the District. Wages were found to be fair and labor trouble at a minimum. Union and non-union men men work side by side without friction. The average workingman is thrifty and sticks to his job. A large percentage of workers are permanent residents.

Los Angeles has a large consuming population. Its growth is healthy, and the advent of the new Manufacturing District is fast attracting increased population and wealth. Thus, with a growing market and constantly increasing facilities, the marketing problem is solving itself. The city's banks are prosperous, and the Manufacturing District itself is directly served by an institution located within its boundries, the Southwest State Bank. Ample banking facilities are provided.

Local public utilities are well and economically managed, and light and power, both gas and electric, are obtainable at a cost considerably lower than in the average American City. The city's supply of drinking water is unique, being drawn from the Los Angeles aqueduct and from heavy flow wells.

As a business booster, Los Angeles boasts that it has no equal. Eastern paragraphers have found this a theme for humor, but on the Coast it has proven a business-getting virtue.

The city has a superb faith in itself, not without reason. From a village of 1,500 in 1847, it has risen to a city of more than 900,000 inhabitants, with another 250,000 just outside its corporate limits.

Chief among the city's boosters are the Chamber of Commerce, the Commercial Board, the Greater Los Angeles Association, the City Club, and the Kiwanis Club.

"PLAYIN' POLITICS"

The Week's Developments in Congress

By JOHN M. TOWNSEND

Special Correspondent, MANUFACTURERS NEWS

POLITICS, which have characterized the conduct of this Congress since the beginning of the session last December, will dominate the question of adjournment before the meeting of the national party conventions.

Practically all of the legislation of the session must be finally enacted during the month of May if Congress is to adjourn by the first week in June. None of it is in the form asked for by President Coolidge in his message last December. All of it has been trimmed and added to to suit the politicians, particularly the democratic-progressive alliance.

President Coolidge will receive his severest test on this legislation next month, but the prediction heard in Washington is that he will ignore politics and veto or sign these bills on the basis of the public welfare alone.

THE BONUS

With a few minor changes the Senate has practically reenacted the House soldier bonus bill. In reality this bill is totally unsatisfactory to those who voted for it. In the face of a certain presidential veto of an all-cash bonus bill, however, Congress hit on the insurance plan which is not wanted by the rank and file of the veterans and which, in the end, will cost the taxpayers around $3,000,000,000.

This bill was passed because it was the only kind of a bonus measure which could pass over a presidential veto and Congress was determined to enact some kind of a bonus bill at this session. In view of the hypocrisy which has characterized the whole performance in Congress, of the confession which the bill itself makes that no immediate relief is needed by the rank and file of the veterans, of the relief which is offered, which will hardly be realized in the lifetime of the veterans, and of the cash expenditures which the treasury must make under the provisions of the measure, it is difficult to foresee how President Coolidge, with his logical, analytical mind, can sign the bill. However, this is only political hurdle Number 1 put up to the president by this Congress.

THE TAX BILL

Notwithstanding the favorable report of the Senate finance committee of the Mellon plan of surtaxes on incomes, there is real danger if not a real probability that the senate will finally adopt the Simmons democratic substitute for the committee report carrying surtaxes on the higher incomes to a maximum of 40 per cent.

Substantially the only changes made in the House bill by the Simmons substitute is the elimination of fractions. The House leaders, including Rep. Longworth, who proposed the compromise measure, appear determined to stand by their measure to the end regardless of whether the Mellon plan or the Simmons plan is adopted by the Senate, and the lowest the House will go in a compromise is the 35 per cent maximum.

Here is another attempt by this Congress, for political purposes, to skate just as near the edge of a presidential veto as possible and, at the same time, to hold out enough sop to the taxpayer so as to escape responsibility for failure to enact tax reduction legislation if a presidential veto results. This is political hurdle Number 2 for the President.

While he has given no recent indication of his attitude on such a measure as is now pending and likely to be adopted, the president has said repeatedly that he favors the principle of the Mellon plan. President Coolidge never is of two minds. If he is for one thing he is against every other thing and if he is as consistent as usual, provided material changes are not made in the pending bill, he is liable to be heard from vigorously on this measure also.

IMMIGRATION

After thrashing up the hill with a tremendous blare of oratory as to what it would do with immigration legislation, the Senate finally added a definite Japanese exclusion provision to its bill and rescinded all its quota figures based on the census of 1910 and surrendered to the House on the 1890 quota. The present indications are that, despite the manner and the method of including the Japanese exclusion provision in the bill, both of which were unnecessarily offensive, this bill may be passed in such form that the president can sign it.

Nevertheless the legislation from beginning to end has had a political background which, until very recently, threatened the passage of any immigration bill. In fact, the measure is not yet entirely out of the woods on that score and may yet be retained in conference until after the presidential elections.

If that is done the present quota law will have to be reenacted by resolution, otherwise the bars will come down entirely when the law expires by limitation next June.

AGRICULTURE

This week the agricultural committee of the House reported an amended form of the McNary-Haugen bill providing for the formation of a $200,000,000 corporation for handling all surplus agricultural products or export. The products are to be bought for this purpose at a minimum, fixed price, sold abroad for what they will bring and the government is eventually to be reimbursed by the collection of an excise tax on future shipments.

As a temporary stop-gap for a temporary condition in a limited territory, the legislation is satisfactory to nobody. In essence it tends toward the principle of paternalism from which the government is trying to escape. Some of the farm organizations favor the legislation for the lack of something better. Congress does not like it but is afraid to adjourn without doing something for the farmer. If Congress does adjourn and another farm crisis arises about crop moving time, the political consequences might be considerable.

The real problem Congress is trying to solve is how to legislate to prevent something which has not yet happened and may not happen. While fully sympathetic with the desire to do something constructive to help the farmer, the President is no more impressed with the merits of the McNary-Haugen bill than its friends in Congress. Whether or not that legislation has a chance of final enactment will depend largely on circumstances yet to be developed.

THE RAILROADS

The iron hand of the opponents of the Esch-Cummins act, including all of the LaFollette group, is seen in the move this week to bring before the House the Barkley bill, ousting the Railroad Labor Board and substituting a series of boards and commissions at high salaries.

Under the new rules the bill can be forced on the House calendar and will probably come up for some kind of a vote. While the democrats sponsor the bill in the house, Senator Howell of Nebraska, a republican who agrees with LaFollette on railroad legislation, is the sponsor in the Senate.

There is every indication of a democratic-progressive alliance on this bill and there is every indication that LaFollette is playing for the railroad vote for a third party this fall by pressing this legislation. This measure cannot pass over a presidential veto and it has not yet been brought to the attention of the president in a way that requires him to make any decision one way or the other.

ALEXANDER REVELL Says—

By A. T. PACKARD

IF Alexander H. Revell retains his present game he is very apt to be champion as well as president of the Illinois Senior Golfers Association. He is a consistent player in the 80s on any course, taking an 85 last year at the Oak Park championship of the Seniors, against winning score of 83. Mr. Revell ly made a clean-up of the age limit naments in the south in the past few ths, including the historic Governors' at the Everglades annual champion-. If memory serves, he is a three or r-time winner of his class in the cham- nships of the Apawamis Seniors.

n the Illinois Seniors, Class A is com- ed of men of seventy or over and Class ncludes those of sixty-five to sixty-nine lusive. Mr. Revell is included in Class so it is not a particularly wild assump- n that he has passed the fifty-year limit ned by a British medical authority as danger mark, after which golf should discarded as an exercise.

On this point Mr. Revell has some very sitives ideas and furnishes the very best ustration of them in his own physical d mental vigor. In a general conver- tion on the subject just after his return om the South, he said:

"Moderate exercise, taken regularly, ght, barring accidents, to maintain ough physical vigor to make a man live be a hundred or more. There is no cret about it and no danger whatever playing golf or any other game, so ng as one takes his play as seriously as is work.

"There is no basis whatever for the atement that fifty or any other age is a angerous age for golf or any other exer- ise. The only point to be considered is at the person, man or woman, take the xercise reasonably and well within his r her powers.

OVER FIFTY?

"There is no basis whatever for the statement that fifty or any other age is a dangerous age for golf or any other exercise."

"A boy or girl can, without permanent arm, play to the point of exhaustion. It vould be silly to suppose that a person of ifty or more could take exercise to the ame point of exhaustion without harm. t is unreasonable and immoderate for a person over fifty to hink that anything but harm can come from over-indulgence n any form of exercise. A good rule in exercise for those over ifty is that of the dieticians who declare that a person always hould leave the table before the appetite is fully satisfied.

"If a person over fifty feels at all tired at the end of nine holes f golf, right there is the time to stop. And right then also, is he time to rest.

"It is really a wonderful thing that there is so little of ill-ef- ects following over-indulgence in exercise and neglect of fol- owing precautions. Over and over again one sees persons exer- ise to the point of exhaustion and then hustle home, perhaps in n open car, without a shower or even changing clothes. As likely as not, such a person appears the next day as chipper as you please and again over-exercises.

"Such persons will play thirty-six holes of golf instead of the nine or eighteen holes they should have played. Of course, the time will come when they really will step over the danger line and pay the penalty. And then will follow such a dictum as that of the British medico who says it is dangerous to play golf after one has reached the age of fifty.

"The real danger and the only danger to health in exercise is that one does not take it reasonably—entirely within one's physical limitations and powers of recuperation.

"I have worked out my own system of exercise and find it fits my case. Perhaps others can follow it to advantage. At least, it would be an advantage for anyone to adopt the general principle of never over-doing it, no matter what the form of exercise.

"Of course, I like golf above all games or forms of exercise. Unless the weather absolutely prevents, I never miss at least one round a week, playing often when it is necessary to bundle up in warm clothing to an extent that prevents a free swing.

"When compelled by necessity, perhaps reaching a final round of thirty-six holes, I play that number, but never do so voluntarily, although I have never had any ill effects from playing the full route. But on the very infrequent occasions when I have thirty-six holes ahead of me I am careful to take the precautions of a bath and a resting period after the first eighteen. I do not feel the need of it but I think it is a proper precaution.

" If I cannot play golf I indulge in my next favorite—swimming, especially the high dives from a spring- board. If both these pleasures fail I find some other form of daily exercise, even if it is only a brisk walk.

"It isn't necessary to say that good health is based on exercise. That is taken for granted. The crucial point is to find some form of exercise that one likes and to go through with it regularly and in moderation.

"What a pleasure it is to see such a group of men as the Illinois Seniors! Perhaps twenty of them are over seventy; one, at least is seventy-nine, and every one of them is bright-eyed and vigorous. It may readily be that one of them may prove a living illustration of the statement that, barring accidents, a person who exercises properly should live to be a hundred or more."

Intimate acquaintance with the Illinois Seniors fully bears out the thought of President Revell. Owing to their ages, they naturally include the bone and sinew as well as the mental attributes of the leading citizens of the state. The roster of the association reads like that of the Blue Book. They are a husky-looking lot and well able to bear their share of the burden of good citizenship which each of them is carrying.

The point it is wished to emphasize in all of this is that each of these men is or has been a hard desk-worker and has neutralized the consequent ill effects by exercise. Their favorite exercise is golf, but each has some other form of exercise on which to fall back when golf is impossible.

As a matter of fact, a new cult of exercise is spreading over the

"18-YEAR OLD" LABOR

THE House has passed the resolution proposing an amendment to the Constitution, empowering Congress to limit, regulate or prohibit the labor of minors under eighteen years of age.

Apparently, the goal of this measure is coming generations of youthful idlers.

Several years ago, a section of the Internal Revenue Bill undertook to bar from interstate commerce all manufactured products by labor under sixteen. The present measure goes two years further.

Someone has a grudge against work.

The average city boy and girl, nowadays, finishes grammar school at the age of fourteen. For more than half of them, the next step is the "two-year commercial" course, offered in practically all modern high schools.

Presumably, they are to "loaf" the two years remaining until they are eighteen.

Of course, it is too much to expect of Congress that it would take into consideration possible financial stringencies that necessitate sending Son or Daughter out to work to "help out."

Naturally. Representative Ramseyer's proposed amendment to exempt minors on farms from the new prohibition was smashed, 158 to 120. What the modest farmer, who has depended upon the help of his one or two or three husky sons, is to do when planting and harvest times roll around is—but why bother about mere details?

Abraham Lincoln ought to have loafed around and let his mother do the rail splitting. And George Washington had no business starting in surveying when he did.

Socrates, wise old Greek philosopher, once remarked—"If I had my say, I would send all the young people to work, and all the old ones to school." It is only after one has battled with actual life and has been made to *feel* the need of education, that education becomes really a thing of value.

Honest work never hurts anyone, young or old. A workless age, however, has its attractions for a great many persons of a certain class.

It is also popular enterprise with a certain group that has its own particular and very sharp axe to grind. The labor unions will favor anything that will restrict production, cut down the hours of labor and monopolize the labor market.

A DISTORTED SYSTEM

BUSINESS is being attacked on every hand by Congress. The situation is extremely serious. Business men are asleep.

Congress is rapidly becoming a dangerous and destructive force. Rome fell on account of excessive taxation. There are at least five bills on the road to passage, any one of which if not properly amended will work great hardship on the industries and bring about stagnation, unemployment and misery.

Do not take this signal of alarm as a false cry of "Wolf, Wolf." The wolf is snapping at your heels. Manufacturers and all business men of the country should rise up as one man and demand a square deal.

The only remedy is personal contact between the business interests and the members of Congress. Would your company be willing to send its principal executive officer to Washington to spend a week at the Capitol with representatives from other industrial states for the purpose of bringing to the attention of members of Congress the dangers which beset us? The most effective way to deliver a message to a public official is to deliver it face to face.

BUSINESS

SURFACE indications seemed to point to a slight unsteadiness in business conditions this week, due, presumably, to the status of national politics and uncertainties in foreign trade. Beneath this outward show of uneasiness there was an increasing tendency toward self-confidence in practically all industries.

Quarterly and annual (1923) reports of earnings, slowly trickling through the channels of publicity, did much to stabilize domestic affairs. Promising reports from Government bureaus engaged in surveys of farm conditions were received, steel earnings—often termed a "barometer of business"—were on an upward trend, and labor, generally, was quiet.

It is evident that, despite efforts to the contrary, some disturbance of industrial equilibrium must be looked for pending the Presidential election. Industrial leaders everywhere, however, point out that this is only a natural reaction, and that no actual ill effects have been or will be the result.

DAYLIGHT SAVING

ONE of the principal objectio "daylight saving time" is its p nicious effect upon one's mental proc

Ten-thirty, p. m. (daylight saving tim arrives. Time to "turn in,"—but th the radio, or that last chapter, or just more hand—and anyway it's *really* o nine-thirty, you know.

And so, when we finally do decide favor of slumberland, it's usually "reall only midnight, or one or two in the morning.

But the office clock says it's one, or tw or three.

THAT GERMAN LOAN

J. PIERPONT MORGAN pledges that the Allies accept General Dawes' pla at once and "as is," an American banking syndicate will subscribe half of the proposed 800,000,000 gold marks ($200,000,000) German loan.

Mr. Morgan is assumed to be pretty well informed as to the status of world finance. He is a banker, and bankers do not often advise loans unless good security is fairly evident.

Apparently, Mr. Morgan believes there is enough left of Germany to secure a $200,000,000 note. General Dawes is of the belief that the proposed loan would aid materially in putting Germany on her feet.

Perhaps German affairs aren't so bad as they have been painted.

A GOOD THING

INCREASING numbers of employers are signifying their intention of allowing a certain percentage of their employes time off with full pay to attend National Guard and Citizens' Military Training Camps Association training courses this summer. Many have announced an additional two weeks "regular vacation."

It would be a good thing for every manufacturer in the country if he could have every one of his employes attend one or more of these courses during the next three years. It would do more to combat that ugly spirit of unrest and insubordination than all previous measures put together.

The government describes the purpose of the C. M. T. C. courses as being "to bring together young men of all types, both foreign and native born, to develop closer social and national unity; to teach the privileges, *duties and responsibilities* of American citizenship; to show the public by example that camp instruction of the kind contemplated will be to the liking of their sons and that it will develop them physically, mentally and morally, and will teach Americanism in its true sense."

Concerning the National Guard, no explanation is necessary. Every manufacturer—every employer—knows that the National Guard is the State's first line of defense in case of disorder. The National Guardsman, whether on or off duty, stands for law and order. He is a valuable citizen and an equally valuable employe.

TRADE-MARKS MENACED?

Lawyers See Danger to Manufacturers' Rights

Threatening Legislation Up in Congress

REVOLUTIONARY legislation that, it is declared, would completely revise existing trade-mark law and perhaps imperil millions of dollars in trademark rights is pending in Congress.

This legislation is contained in Senate Bills 2920 2679, both of which have been referred to the Senate Com- :ee on Patents.

These two bills," according to Attorney Otto R. Barnett (Chi- o), "completely revise existing Federal trade-mark law, and frankly drawn on distinctly opposing theories and lines."

he bills are Senate Bills 2920 and 2679. "Apparently," Mr. nett says, "the manufacturers and commercial organizations not even know of their pendency."

The bill, Senate 2679, was drafted by a special committee of the ierican Bar Association, including in its membership a num- of members of the American Patent Law Association. It has n somewhat widely discussed, revised, and enlarged, but has t been approved in its present form by the American Bar sociation. The bill Senate 2920, has been drafted by a number individual members of the American Patent Law Association d others, who disapprove of litigation of trade-mark matters rights in the Patent Office, by way of opposition, interference, cancellation proceedings.

SENATE 2920.

The salient features in which this bill differs from the Act of 05 as amended, are:

1. In stating or defining those who may register, it uses the ssignation, "any person *using* a trade-mark in commerce with," c., and "*believing he has a right to use the same*, provided such ser be domiciled," etc. This avoids all mention of *ownership* r of *exclusive* use, and merely recites use and believed right of se.

2. It permits use and registration of a portion of the name of orporations or associations.

3. It contemplates registration of any mark used by an applicant r his predecessors in commerce with foreign nations, among the tates, or with Indian tribes, which mark was in actual use as a rade-mark by such party or parties five years next preceding his pplication, and its subsequent extension to additional articles r classes after use in such class or classes for at least one year.

4. It modifies somewhat the provisions as to assignment and ssuance of certificate to assignee.

5. It provides (Section 13): "That whenever it shall appear from a written abandonment of the use of a registered mark, signed by the owner of the registration, or from a certified copy of a final decree of a Federal court, permanently enjoining the owner of a registration and his successors and assigns from using the mark registered, filed in the Patent Office, the Commissioner may cancel the registration of the abandoned mark."

6. Except as provided in the section just quoted, *all cancellation, opposition, and interference proceedings in the Patent Office*, in connection with trade-marks or applications therefor, *are eliminated from the trade-mark statutes.*

7. Section 16 declares: "That the registration of a trade-mark under the provisions of this Act shall be *prima facie* evidence of *use* of the mark as a trade-mark by the registrant as of the filing date of his application for registration," and then recites the penalties for infringement. Section 16 thus accurately and precisely states the true, sole, and entire effect of Federal registration. Any incidents, such as *ownership*, follow as matter of law.

The two provisions last noted constitute the most radical and important changes proposed. In them some attorneys foresee danger from pirates, who, taking advantage of the Act, may, they say, deliberately register in their own names the known and established marks of others with the definite purpose of levying blackmail upon the rightful owner as a condition of continuing in the use of his own mark.

SENATE 2679.

This bill consolidates in one Act the provisions of six existing Acts, so far as such provisions are retained. It briefly defines the commerce to which it applies as "commerce within the control of Congress"; recognizes the principle that trade-mark rights in the United States are acquired through adoption and use in trade, and not by registration; and that Federal registration is possible solely because of the power granted Congress by the Constitution "to regulate commerce with foreign nations, and among the several states, and with the Indian tribes." (*Constitution, Article I, Section 8.*)

It essays a new and brief definition of a trade-mark, but provides (Section 31) that except as otherwise provided "this Act is declaratory of the common law as to trade-marks, or trade names or devices, and extends such law to commerce within the control of Congress, and in case of doubt its provisions are to be construed accordingly."

Section 2, paragraph (g) provides that: "*Registration of a trade-mark under the provisions of Section 1 shall be prima facie evidence of OWNERSHIP.*"

It broadens the field of registrable matter, and eliminates ambiguous terms, omits the provisions which have been interpreted as inhibiting registration of the essential part of a corporate name as a trade-mark; abolishes the registration of "ten year marks"; and substitutes registration of marks based upon the fact of their having acquired a secondary meaning. It saves defendants in suits upon registered marks all defenses against the validity thereof which a defendant would have if the mark were not registered; it provides for giving effect to the International Convention of 1883 and the Pan-American Convention of 1910, with a view to just protection of foreigners; and it substitutes for the registration of "one year marks" provided for by the Act of 1920, registration of "Export Marks" obtainable speedily and without opposition or interference proceedings, but subect to cancellation.

Provision is also made for territorially limited registration, and appeals from the Commissioner to the Court of Appeals of the District of Columbia in *ex parte* cases are provided as now; or as an alternative, the case may be carried to a Federal Court in the district where the applicant resides.

Interferences, oppositions, and cancellation proceedings are made appealable only to the Commissioner, whose decision is to be final unless the defeated party carries the case to a Federal Court by a proceeding similar to that in patent cases under Section 4915 R. S. If so taken to the court, all rights of the litigants regarding the mark may be adjudicated, infringement enjoined, and damages and profits accounted for and recovered.

It substitutes for Section 22 of the Act of 1905 a provision that any person damaged by a registration may bring a bill in equity for its cancellation, and provides that registration shall be "constructive notice to all persons," and further, that "no damages *and no profits* shall be recovered" in the absence of proper marking or proof of notice, etc. It further precludes recovery of *profits* from one whose use of the mark was in good faith and without notice, except as to profits arising after actual notice or knowledge, and gives the Court power to set aside determination of actual damages or profits and, in its discretion, to decree "the payment of such sum as the court shall find to be just according to the circumstances of the case, such sum to constitute compensation and not a penalty."

Provision is made for impounding, *pendente lite*, all infringing copies or infringements of the mark; for destruction of the same

OUR ITALIAN IMMIGRANTS

(Continued from last week)

By *ITALO E. CANINI*

PHILIPPO MAZZEI came to Virginia in 1773 to introduce the cultivation of the grape and the olive; he was a friend of Jefferson, and took an active part in the movement for independence. He was sent to Italy in 1779 to obtain army stores for Virginia, and filled this office until 1783. He died in 1816.

From his time to the present, Italians and their American born children, both when their number here was small and when it became larger, have always done their full duty to this country.

During the Civil War they were found on both sides; members of families, as the Festorazzis of Mobile, the Grisafis of New Orleans. and others, that had established a residence in the South, followed the Stars and Bars. Of the comparatively many Italian officers in the Union armies only two can be mentioned here.

Count Luigi Palma di Cesnola, a graduate of the Military Academy of Turin, came to this country in 1860; he volunteered, and entered the army as Colonel of the 4th New York Cavalry, was wounded at the battle of Aldie in June, 1862, and lived in New York to the time of his death. in 1894.

Carlo Di Rudio, who in his native country had suffered and fought for its independence, came to the United States, after an adventurous life in Italy and France, at the time the first shot was being fired at Fort Sumter. He entered the Union army as a private, was entrusted by Gen. Grant with an important mission in 1864, and was made a Captain. He fought gallantly with Custer in 1868 and thereafter, and was the only one of Custer's men left alive in the famous Black Hills massacre after having withstood, alone, for two days, the Redskins' rage. He served the starry banner for 37 years, and was retired with the rank of Major, although he never reached a higher one, owing, it is said, to the secret opposition of a certain foreign government (not the Italian). He died a few years ago.

Many Italians volunteered in the Spanish war, but the acid test of their, and their native born sons', devotion to this country came when the United States entered the world war. In these days, when so great an outcry is made against the so-called hyphen, these hyphenated Italian-Americans contributed nine per cent of the American forces, although according to their number in the total population five per cent would have been fair; and they sustained thirteen per cent of the casualties.

In the words of Captain E. Orsenigo, U. S. A., of New York, "they fought like Hell, too, and there were more citations of Italians for bravery, in proportion to their number, than of men of any other nationality."

Italians in the United States have been, and are now, prominent in the field of higher education. Carlo Bellini, of Florence, filled from 1779 to 1803 the chair of Romance languages at the William and Mary University, of Williamsburgh, W. Va. A tablet to his memory has just been placed in the hall of that institution bearing his name; it was donated by Luigi Carnovale, of Chicago, a man of great learning and writer of no mean ability, author of "Why Italy went into the Great War," and other noteworthy works.

The chair of Italian language and literature at Columbia University has been filled by a succession of eminent men. The first one to occupy it, in 1828, was Lorenzo Da Ponte, poet and playwright, author of the libretto of Mozart's opera, "Don Giovanni," and of several others; builder of the first opera house in New York City, who lived in the United States from 1805 to the time of his death in 1838.

He was succeeded by Felice Foresti, who came to this country after having suffered for his native one in the terrible Austrian prison of Spielberg. In 1858 he was appointed United States Consul at Genoa, where he died, in the same year. He was the author of several standard philological works. Then came Vincenzo Botta, a son of Carlo Botta, the famous historian, author of the History of the War of Independence of the United States.

Prof. Botta, a former member of the Parliament of Sardinia, came to New York in 1853, became naturalized, and died there in 1894. We are indebted to him for several notable works in the English language, one of them a study on Dante.

Among the many teachers of Italian birth or descent in our colleges and universities are Professors Rudolph Altrocchi, of the University of Chicago; Costa of Columbia; Rosselli of Vassar; Lanza of the Boston Polytechnic; Dr. John H. Mariano of the College of the City of New York; Antonio Calitri of New York, translator of Shelley; Rebori of the Chicago Art Institute; Dr. Italo Volini of Loyola University; Dr. Dina Ciancaglini-Cera, of New York, a noted woman writer; Dr. Previtali of Columbia; G. Mantellini, formerly of Chicago; Megaro of the University of Michigan. Angelo Patri, whose studies of child-life are known to newspaper readers throughout the country, is one of the numerous school principals of Italian birth or descent in New York.

The Metropolitan Art Museum of New York owes much to its present importance to the work of Luigi Palma di Cesnola who was its director from 1878 until he died in 1894. Dr. Luigi Roversi, of the University of Bologna, was also prominently connected with it for many years.

Among the sculptors, architects, painters and etchers now living, or who recently lived, in this country, one might mention Amateis, Trentanove, Bracconi, Gregori, Piccirilli, Miserendino, Falanga, Civiletti, Zamboni, Ruotolo, Cartotto, Pellini of the Chicago studio of Holabird and Roche, and scores of others. Fiaccarini, originally of Rome but for the last forty years of New York, is a distinguished follower of Cellini's art. Ferruccio Vitale is professor of landscape architecture at Harvard.

Antonio Meucci, of Staten Island, N. Y., was acknowledged by a decision of the U. S. Supreme Court, in 1888, to be the real inventor of the telephone. Italian Civil Engineers have been, and are now prominent in the construction of many of our public works, notably the New York Subways. The present Italian Ambassador, Don Gelasio Caetani, scion of an illustrious Roman family, is a mining engineer; after graduating in Italy, he obtained a second degree from Columbia, then practiced his profession in the West for several years. Prof. Carlo Prelini, of Manhattan College, recently deceased, was the author of several standard works, in English, on Engineering. Cesare Barbieri, formerly of Chicago, is a well-known mechanical engineer and the inventor of several devices; he is now in New York. Giosue D'Esposito is chief engineer for the company building the new Chicago Union station, and is now superintending its construction.

There are five Italian Chambers of Commerce in the United States; in New York, Chicago, San Francisco, New Orleans, and Detroit. Another is soon to be established in Philadelphia. These are not "alien" institutions; they are associations incorporated under the laws of their respective States.

The Chicago Italian Chamber of Commerce, of which John E. Rigali, of the Da Prato Statuary Company is now president, and Hon. A. Gualano and A. Pecci De Nictolis, vice-presidents, states in its constitution that it is organized for the purpose of promoting commercial relations between the United States and Italy, and of cooperating in everything that may tend to strengthen the bonds of friendship between these two nations; it also provides that the president, the two vice-presidents, and the treasurer must be American citizens. An inquiry a few years ago among its nearly two hundred active members residing in the United States brought out the fact that only two were not citizens, and since then one of those two has taken out his first papers. During the war, when Frank Bragno, of Bragno & Mustari, was president and V. Formusa, and the writer, vice-presidents, this Chicago institution did a great deal of

records with the employment manager and the storekeeper he was enabled to have his trained men and the necessary tools and raw materials delivered to him.

A cost department was inaugurated. Daily the foreman had to fill out certain blanks showing the number of machines in actual operation in his department, the time of the day some of them were idle, the reasons for the idleness, the number of men absent from work, the daily production per man, and so on. These charts, when received by the cost department, aided in the computation of the cost of production of the individual article.

True, the new factory system threw additional work on John B's shoulders. But he no longer had to hire and fire. He did not have to inspect the finished product. A regular inspector attended to that. The repair department looked after the machines. John B. did not have to plan the routine of his department. The factory planning department attended to that. The new order of things brought greater specialization in the factory, and with that, increased and cheaper production, while it demanded a greater degree of executive specialization on the part of John B.

This new specialization called for a specialized foreman who not only could manage men and look after production, but who knew how to co-operate with the other foremen and factory executives. There is where John B. fell down.

For a time the new system did not seem to affect John B.'s standing in the organization. He prided himself on his knowledge of machinery and his ability to get work out of his men. If he bore any disrespect toward the new order he did not show it in his attitude. On the other hand he worked harder than ever but soon complaints began to trickle into the works manager's office.

The superintendent complained that John B. did not act promptly on orders. The storekeeper complained that the foreman often neglected to send in requisitions for tools and raw stuffs sufficiently in advance to enable the storeroom to make the desired deliveries, with the result that men in John B's department began to sit around idle, waiting for the material. The cost department complained that John B. was lax in sending in his reports. To cap the climax, the employment manager complained that John B. sent in a requisition for a half dozen men a day before the time they were needed for an important job. John B. should have acted on the matter at least three days before.

A warning by the superintendent brought John B. to time, but not for long. A week later his laxity again became evident. Too, he had become openly scornful of the "new fangled ideas" being introduced. He could not understand the need for all those records. He had passed a particularly vicious remark about "those —— systematizers." This attitude seemed to have its effect on the workmen, too, some of whom were heard to grow sarcastic at the expense of the new production system.

Things finally came to a show-down when an order scheduled for a certain date could not be turned out in time, although the sales department had promised the customer that it would be delivered at a specified day. The superintendent made haste to John B.'s department. As he entered he discovered the foreman prone on his back, making some trifling repair on a machine.

"What's the idea, John?" burst out the superintendent. "We have a repair department for this. Your job is to manage and get the work out."

"I know," was the sulky reply, "but the repair department is too darned slow."

"How is it you didn't get that Blank order out on time?"

"The storekeeper was too slow. I requisitioned the stuff, but he took his time delivering it."

The storekeeper was called.

"Why," he reported, "I delivered all the raw material for the job as ordered by the superintendent. But there was some material needed later, which the foreman was to requisition. Under the circumstances the foreman should have allowed me sufficient time to get the stuff. Instead he ordered it the last minute. He did not even bother filling out a regular slip. He came into the storeroom excitedly demanding the supplies. I couldn't deliver it right away, but—the foreman does not seem to want to co-operate with my department."

That was why John B. was let out. He would have been retained and given another chance to readjust himself in the new factory organization, but he talked back to the superintendent, told him that he knew his job. He wouldn't allow anybody in some other department to tell him how to run his job. None of that "new fangled system stuff" for him!

The superintendent felt sorry for John B. Before letting him out he gave him a piece of his mind:

"I'll tell you what's wrong with you, John," he said. "You simply don't want to grow with the factory. Yesterday you were a good foreman, because yesterday we ran a small plant, along old-fashioned lines. But we have expanded, just as thousands of other plants have expanded, and with expansion comes new specialization. This requires a new type of foreman, a foreman of today.

"He must be a man who knows his job, his machines and his men, but *above all he must know how to co-operate with other departments in the factory.* We spent a lot of money introducing a new system. None of our new departments can function properly unless every foreman gives his full co-operation. Without that cooperation the whole system is a joke."

The foreman today is regarded as the key man of industry. He not only supervises the individual job but he interprets the plant's policies to the men under his charge. He helps the management figure ways of reducing costs on future jobs. Whereas the foreman once was the "boss of the works," lording it over his men, he is now only an integral and functional part in a huge organization.

"A foreman has two jobs," a federal investigator recently wrote, "a managerial job and a supervisory job. As a supervisor his responsibility is to get out a standard product of required quality and quantity from a standard amount of material. As a manager his job is to get this product as cheaply as possible."

"The cost department in our plant would be quite useless," said a manufacturer recently, "unless every foreman in our plant were sufficiently interested to supply it with the desired information upon which to base cost computations."

Despite the rapid growth of many manufacturing establishments, necessitating the installation of suitable systems, you will see here and there survivals of the old-time foreman. Instead of adapting himself to a new condition, he prefers to think and feel as in the "old times," when factory organization was comparatively simple.

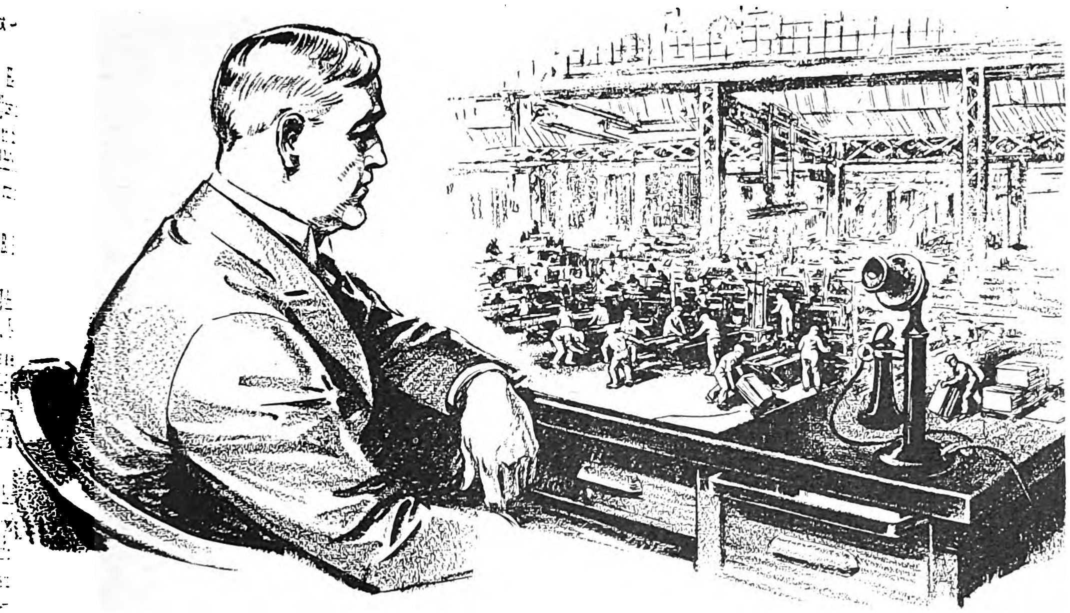
The present need in industry is for reduced operating cost. This means the elimination of waste and the simplification of operations. Industrial engineers have worked out various plans to serve these ends, but all agree that no scheme, no matter how practical, can work out satisfactorily unless the management secures the co-operation of the operating force. The foreman is the medium through which the management reaches the operating force. He is the key man of industry.

"If the keystone is poor, the arch will eventually fall," says Charles B. Allen, an expert on factory training. "A key man is, therefore a man who, on account of his position, holds the same place in a team that the keystone holds in an arch, and a foreman is the key man largely on account of the fact that he stands between the management and the working force just as the keystone stands between the two sides of the arch."

(A SUGGESTION:—"THE 'OLD TIMER'" is an article that ought to be brought directly to the attention of every factory workman. Wouldn't it be a good idea to have it posted on your factory bulletin board, where ALL the men can read it?

Several inquiries for reprints and for permission to reprint "THE 'OLD TIMER'" in plant organs have been received. For your information, permission to reproduce the article in your plant organ probably could be arranged for. Whether reprints will be issued depends largely upon the demand.

Extra copies of this issue of MANUFACTURERS NEWS are available, although the number is limited.)



HAVE YOU REDUCED THE COST OF YOUR COMPENSATION INSURANCE?

The Illinois Manufacturers Mutual Casualty Association, Inc., has been organized by Manufacturers of the State of Illinois to furnish to employers of the State efficient service in the solving of plant accident problems.

The Association through co-operation can effect a large saving on Compensation Insurance premiums each year and in addition furnish superior service to its policyholders.

Clothes washed by Thor last longer

Thor laundered clothes wear longer and appear fresher. When washed in dubious surroundings and handled by uninterested strangers they do not receive the care which gives them long life. A Thor in the home saves you many dollars and your wife many hours. It keeps your clothing free from contact with other washings and does away with expensive replacements of lost garments. Thor launders for you quickly, economically and efficiently. See it in operation today—you'll understand its superiority.

and of all plates and means of making them; and of all printed matter containing copies of the infringing matter, except where the same is a catalogue or mainly non-infringing matter, in which case the Court is given discretion.

Under the Act, Clerks of courts shall advise the Commissioner of Patents of pleadings filed, and of decrees and judgments entered in trade-mark actions pending therein.

The bill repeals the Act of 1905 and Section 526 of the Tariff Act of 1922 forbidding entry of imported merchandise carrying the name of any domestic manufacture, infringing a registered trade-mark, or bearing a false designation of origin, and substitutes provisions covering the same ground, and authorizes summary proceedings in such cases. Care is taken by the bill of registrations under prior Acts.

Leading attorneys, after examining the pending bills, point out that their provisions differ principally with that—

"That the exclusive right to the use of a mark or device claimed as a trade-mark is founded on priority of appropriation; that is to say, the claimant of a trade-mark must have been the first to use or employ the same on like articles of production."—*Columbia Mill Co. v. Alcorn,* 150 U. S. 460.

In most other countries priority of registration creates an absolute and indefeasible right to exclusive use of a trade-mark, and ousts any prior originator or user thereof who failed to register first. In this country, registration is not now a means of acquiring or creating a right, but merely makes public record of a claim or assertion of adoption and use, and establishes only the fact that at the date of application for such registration the applicant claimed or asserted such adoption and use, and alleged a definite and stated date of adoption.

It does not establish ownership, or actual date of adoption, or priority of use, but merely raises a *prima facie* presumption of adoption and use as of the date of application for registration, which presumption if proven correct, will imply or carry ownership.

Another may in fact have been earlier than the registrant in adoption and in actual and continuing use of the same mark, on like goods, in commerce within the control of Congress, in good faith and in entire ignorance of registration by another, and may later establish his right of ownership of the mark.

"This property and the exclusive right to its use were not created by the Act of Congress, and do not now depend on that Act for their enforcement. The whole system of trade-mark property and the civil remedies for its protection existed long anterior to the Act of Congress, and remain in full force since its passage."—*Trade-Mark Cases,*" 100 U. S., 82 (99).

The right is one growing out of and founded upon the Common Law, and exists wholly independent of Federal registration, or Federal statute, and ownership is based upon priority of adoption and continuing use thereafter. If the use be wholly within a State, such State may control and protect its use therein, but the Federal Government may not. Practically, if not literally, all the States provide by law for registration of trade-marks therein. The Federal Congress is without power to control commerce within a State because no State has surrendered control thereof to the United States, and the power is not given by any provision of the Federal Constitution. The Supreme Court of the United States has recognized the right of each of two or more parties to use concurrently with others, but in distinct and different sections of the United States, the same mark upon like goods. And this was held permissible both where the mark was registered and where it was unregistered, in the Patent Office.

GOMPERS ATTACKS ANTI-TRUST LAWS

Parker Heads National Civic Federation

An attack upon the Sherman Anti-Trust Law by Samuel Gompers, president of the American Federation of Labor, was the outstanding feature of a meeting held this week in New York under the auspices of the National Civic Federation.

Mr. Gompers declared that the Federation of Labor looks upon anti-trust legislation as of menace to individual enterprise, production and distribution.

Alton B. Parker was elected president of the civic federation, Mr. Gompers and V. Everit Macy, vice presidents; Samuel McRoberts, treasurer; D. L. Coase, secretary; Ralph M. Easley, Chairman Executive Council; John Hays Hammond, Chairman Deportment on Current Economic and Political Movements; William G. Mather, Chairman Welfare Department; Jeremiah W. Jenks, Chairman Department on Immigration; Miss Maude Wetmore, Chairman Woman's Department; August Belmont, Chairman Workmen's Compensation Department; Warren S. Stone, Chairman Social Insurance Department; Conde B. Pallon, Chairman Department on Study of Revolutionary Movements; Alvah H. Doty, Chairman on Department on Public Health Education; A. J. Porter, Chairman Minimum Wage Commission; Gertrude Beeks Kasley, Secretary Executive Council; Mrs. Coffin van Rensselaer, Executive Secretary Woman's Department.

MANUFACTURERS TO MEET IN N. Y.

National Conference Called for May 19th to 21st

Progressive manufacturers from all parts of the country will attend the Twenty-ninth Annual convention of the National Association of Manufacturers in New York May 19 to 21. Addresses by some of the most prominent industrial leaders in the United States will be heard.

Among the subjects to be discussed are:

The truth about industrial Russia, transportation and foreign trade, trade-marks and patents, the open shop, industrial relations, linking the shop with the office, the farm problem, immigration, taxation, the political and legislative horizon and the national coal situation. One of the principal reports to be made will be that of "The Platform for Industry for 1924," which has been in course of preparation since last September.

The convention will be held in the Waldorf-Astoria Hotel.

PAYROLL TAX OKEH SEN. SMOOT SAYS

Meyercord Explains Plan

"I note what you say in relation to this suggested tax, and I see without further investigation many advantages that would result."

That is the reply of Senator Reed Smoot, chairman of the Senate Finance Committee, to George R. Meyercord's suggestion that a payroll tax, based on 5 per cent of the annual payroll of manufacturers and business men, be substituted for the proposed sales tax.

"When public officials recover their common sense and the present hysteria of blackening the name of every public man has run its course, it may be a splendid thing to start an educational campaign for this (payroll) tax," Senator Smoot suggests.

"I do not believe that a payroll tax would be opposed by the consuming public as is the sales tax," Mr. Meyercord says.

"As the payroll is a part of the merchandise, it would, in fact, however, go right back to the principle of a sales tax. But instead of a factory having five, ten or fifteen thousand transactions a month to be checked, and instead of rebates, allowances and deductions, as with the sales tax, the payroll tax would be a fixed entity, one, two or four times monthly. The administration would be very simple, and the tax would be honest.

"Take a factory like mine. If its payroll were half a million dollars and the tax five per cent, the payroll is issued twice a month and there would be only 24 entries annually. The payments to the government could be made at the time the payroll is issued. The payroll tax would not appear directly to the public.

"Other than customs and internal revenue, this tax would eliminate all forms of taxation with the exception of income tax on unearned incomes. To satisfy the farm-

CONSTRUCTION

BOND

"The Paper of Known Substantial VALUE"

FIRST impressions do count and they mean just as much in the letters you write as in the interviews which your salesmen secure to sell your goods.

The first impression which any letter makes depends on the stationery on which it is written. For as you have frequently heard —"Your stationery is your business photograph."

You can secure, if you are willing to pay the price, impressive stationery which *advertises* its *expensiveness* and, theretofore, inevitably suggests extravagant methods, high prices and fat profits—or you can use CONSTRUCTION BOND, the Paper that makes Impressive Stationery at a USABLE PRICE.

Construction Bond is known to be less costly for its quality than other fine bond papers because it is marketed not through local jobbers a *fraction of a ream* or more at a time, to any printer or lithographer who will buy them, but *direct* to *responsible* printers and lithographers throughout the United States, in quantities of *500 lbs. or more* at a time.

Thus every sheet of Construction Bond goes into your business stationery *minus* the usual jobber's profit, *minus* his expenses of handling small lots, minus his losses on small and questionable accounts—only the expenses essential to perfect distribution and service are left.

The next time you order stationery be sure to specify Construction Bond, "The Paper that makes Impressive Stationery at a Usable Price."

What Are You Looking For From a Printer and Binder?

Equipment	The necessary modern efficient machinery and buildings to economically and speedily produce the printing and binding required.
Personnel	An organization of thoroughly trained men and women to operate the plant and deliver according to agreement, both as to time and quality.
Experience	Forty-six years of active continuous operation under the same name and management.

Our advice is to place your printing and binding with a firm that you know has these qualifications.

Your inquiries will be given our utmost care and attention.

As was the Central Manufacturing District of Chicago, that of Los Angeles was an outgrowth of modern industrial conditions. Both districts were created to satisfy a demand for facilities which the manufacturer requires for efficient operation of his business and which, individually, he could not provide, the amount of money necessary being so great as to make it impossible for the individual to undertake the venture alone. By making the District a specialized form of business, with competent organization and sound financing, industries of all kinds, large and small, are provided with these facilities under conditions which otherwise would be unattainable.

The site of the Los Angeles District is in the south-east section of the city, within easy trucking distance of its business center. It is a part of an old Spanish-grant ranch, the "Rancho San Antonio," 300 acres of which were acquired.

The District is laid out scientifically in areas adapted to the needs of resident industries. A belt-line, the Los Angeles Junction Railway, provides switch-tracks connecting every lot with the main line which, in turn, connects with all of the roads entering the city.

Arrangements for factory sites are made through the District Company. Only concerns of good reputation are admitted, a precaution insuring a worth-while and permanent growth.

The business men of Los Angeles are doing everything possible to encourage new industries. Their assistance is invaluable, the District management declares. Perhaps the most comprehensive statement concerning Los Angeles' new prosperity is that made in a recent issue of the *Central Manufacturing District Magazine* by W. T. Bishop, treasurer and past president of the Los Angeles Chamber of Commerce—

"Authorities on industrial conditions in the West repeatedly have declared during the past few months that Los Angeles made products valued at more than $1,000,000,000 in 1923. Recently the ranks of industry have been augmented by so many new plants and production increased so much that A. G. Arnoll, manager of the industrial department of the city's Chamber of Commerce, has declared that the aggregate value will be approximately $1,100,000,000. Others have become so optimistic that they have named a figure as high as $1,250,000,000.

"That Los Angeles should pile up so great a total seems little short of phenomenal when it is remembered that, in 1900, the aggregate value of manufactured products was $15,134,000. Ten years later the figure was $68,586,000. It was increased to $788,652,885 in 1920, and to $959,806,503 in 1922.

"If a period of reaction must follow a period of intense activity, it will be altered materially in Los Angeles. Balanced prosperity, or prosperity insurance, Los Angeles has agreed, is founded on factories, mills and plants."

STAGING A "COME-BACK

How the Railroads are Making Good

WHAT is asserted to be one of the greatest plans ever formulated by any group of enterprises for their own protection and for the purpose of staging a "come-back" into public favor, is being carried through today to a successful conclusion by the railroads of the United States.

So remarkable have been and are the results of this plan that already, in political circles, the word is being passed that "the roads" are no longer good fuel for political furnaces.

There are now about 300,000 surplus freight cars on hand—a surplus above the transportation needs of American industries and agriculture. More than 4,500 surplus locomotives, serviceable but stored against possible future requirements, are on hand. There are still on order, or coming forward for delivery, about 70,000 additional freight cars and about 500 additional locomotives.

Transportation has been speeded up, and shippers today, according to officials of shippers' organizations, are receiving a medium of service seldom if ever before attained.

During the latter part of 1923 and to date, the roads have so increased the efficiency of their service that shipping time has been reduced by one third. This alone, it is declared, has served to make friends of a great many former enemies of the roads.

Faster service has not only reacted to the direct advantage of the shipper, but also of the wholesaler and, through him, the retailer and consumer-public. According to commercial reports, the time occupied in moving material heretofore from producer to consumer was about five months. That has been reduced, now, to three months.

Those two months, it is declared, mean enormous savings in storage charges, interest on notes and similar overhead expenses.

The result, it is reported, is a distinct upward trend in the standings of the railroads, both in the estimation of the manufacturer, shipper and the general pu Complaints of poor service are negli and, in many industries, nil.

The roads themselves have inaugura a new "approach"—one of friendliness a cooperation. They have divided the co try into districts, or "regions," and, in ea have organized, or are organizing, "shi pers' advisory boards."

That the roads themselves are profiti as a result of these "expanded" polici is evident in their reports. The plan i working out so well that the managemen declare that, in another year, the hue an cry against the railroads will be a thing of the past, relegated to railroad history as a curious phenomena of post-war agitation.

N. Y. C. Promotes Dinan

Daniel W. Dinan, formerly general superintendent of the second district of the New York Central, with headquarters at Buffalo, has been appointed assistant general manager, to succeed T. W. Evans. Mr. Evans becomes an assistant vice-president of the system.

country. It is within the memory of nearly every reader, when a group of business men looked with suspicion upon any one who favored any form of exercise that could be taken during daylight hours. Nowadays, if a group of corresponding business men meet, two or perhaps a dozen make golf dates while the remainder refrain only because business prevents. There is no one to question the statement that such a group of business men conduct their various businesses as well as did the men of a previous generation..

Continued from Page 12

valuable patriotic work in promoting subscriptions to the Red Cross, the sale of Liberty and Victory bonds, and in other ways.

It is a remarkable fact that there is hardly one of the charges now made against the immigration from Southern Europe that was not made against that of the Nordic races towards the middle of the last century.

The English, Irish, Germans, Danes and Swedes who came in large numbers at that time were, in the eyes of the anti-immigrationists of the day, paupers, insane, criminals, and diseased; they were poorly fed and badly housed; their coming would lower the American standard of life; then as now, the opponents of immigration boasted of being the only true Americans. It is easy to imagine what would have happened to this country if nativists and know-nothings had had their way. Instead of being the greatest nation on earth, had it been left to the natural increase of the population it had in the early days of the Republic, without the addition of the many immigrants since that time, the United States would now be a country certainly inferior to Canada, and perhaps of the population and importance of one of the small Central American republics. The Southern races, coming here after 1880, added their services to the great ones rendered the country both before and since that time by the Nordic. A deterioration of the American people is not in evidence. The newcomers have done their share in making the country what it is today.

FACTS ON CREDIT

By C. W. SILLS

Vice-President, Halsey Stuart & Company (Chicago)

Copyrighted 1924 by The American Bankers Association of America

EDIT, as used in business, is defined s a trust based upon a transaction ving the exchange of goods for money ner goods, in which payment by one e parties thereto is deferred to some e date.

e cornerstone of all credit is confi- in ability to pay whether it be a nment, a corporation or an individual. rough the media of credit instruments rious kinds, credit has served to speed e circulation of money. Figuratively, s present high stage of development, t has made one dollar now do the of fifty dollars. By means of off- ng credits against each other, a tremen- volume of business can be done and only a relatively small amount of cash eeded to settle the balance. It is by process of balancing off credits in the n of notes, drafts and bills of exchange red through and by means of the banks, l clearing houses and the Federal Re- e System, together with the confidence sed in these institutions by the public arge, that has made possible the financ- of the commercial credit requirements ndustry on the extensive scale that it is ng conducted today. The financing of investment credit demands of modern ustry can be traced to the increasing h of investors in the general integrity business methods and in the stability l earning capacity of corporate enter- se.

ommercial credit, as such, represents a rt term loan to finance a going concern nporarily, with immediate or seasonal ds, thereby enabling it to purchase its materials and to finance the manufac- e of its product until marketed and paid r. Commercial credit is commonly evi- nced in business by open book accounts, omissory notes, and acceptance (bank or de).

Open Book Accounts or "charge ac- unts" are merely "accounts receivable" "goods sold for which payment has not t been received." On the books of the rchaser the items would appear as "ac- unts payable" or "purchases unpaid r." This is the commonest and most formal kind of commercial credit and oes not give rise to an instrument of cred- , statements being rendered every week or onth as the case may be, for settlement.

Promissory notes are formal instruments f credit involving a written promise to ay on the part of the borrower to the nder of a certain sum of money at a cer- in future date. Such an instrument may e executed by corporations or governments s well as individuals. In the case of gov- rnments or municipalities such instruments re issued in anticipation of taxes or current revenues not yet due and usually take the form of 3 to 6 months notes called tax anticipation certificates or certificates of indebtedness.

Acceptances are time drafts or bills of exchange representing not a promise but an order from the drawer of the draft to the drawee directing the payment of a certain sum of money to the payee on a definite future date. The payee may be the same as the drawer of the draft or some third person. This instrument to be valid requires "acceptance" of it evidenced by the signature of the drawee written across the face of the instrument. The acceptance is similar to the trade acceptance except that the former is endorsed or accepted by a bank rather than by a private individual. A bill of exchange is synonymous with time draft or acceptance, the name being used by bankers sometimes to designate bills drawn on parties in foreign countries.

Investment credit instruments divide themselves into two classes, stocks and bonds.

Stocks are certificates representing shares in the proprietary interest of a corporation and as such entitle the holder in whose name the stock is registered on the books of the Company to participate in the management, risks and profits of the business. In other words, an individual holding stock is really a partner in the business sharing in the incidents of management, risk, and income in proportion to the number of shares which he holds.

Bonds, on the other hand, including notes, which are similar in character although usually of shorter maturity and unsecured by mortgage liens, are a formal promise to pay secured either by property or collateral bearing a fixed rate of interest and usually of fixed maturity.

The stockholder is an owner assuming risk of ownership in the direct or indirect operation of the corporation for profit. The bondholder is a preferred creditor loaning money to the corporation for a certain length of time at a fixed rate of interest. He is secured in event of non-payment of principal or interest by a legal contract enforceable by law for the satisfaction of his claim. The stockholder, on the other hand, cannot force payment of a return upon his investment if it is not earned. Thus the position of the stockholder is subordinate to that of the bondholder, both as to assets and to distribution of earnings in the form of dividends.

Stocks are commonly divided into two classes, common and preferred. Common stock carries with it the right and privilege mentioned previously in connection with the general characteristics of stock as dis-

Are You "Behind the Times"?

Not many years ago your grandfather reaped his crops—picked his cotton — dug canals and loaded his ships by hand. He also shoveled coal on his fire and hauled out ashes.

Today — you have advanced. You have machinery to do the work your grandfather did by hand. But—do you still shovel coal and haul out ashes? In Chicago today—Manufacturers are keeping abreast of the tide of industrial advancement and *improving* their products, simply because they know that—

If it's done with heat—

How You may know Economical Gasoline

WHEN you find the particular brand of gasoline which gives you the most miles per gallon, you will use it, of course, just as you now use the make of tires which give you the longest wear and the grade of oil which renders the best lubricating service. As a successful business man you could not do otherwise.

Contrary to usual beliefs, all gasolines are not the same. Methods of refining and manufacturing formulas vary with each gasoline refiner. Consequently, different brands of gasoline vary as do the men who make them.

When the gasoline you use is of proper quality, it will give you most miles per gallon, and reduce your delivery and hauling costs. If you secure an addition of only one mile from each gallon you use, you will reduce your gasoline costs from 6% to 25%.

This saving is very worth while and is quite possible if you will use

RED CROWN
GASOLINE

Red Crown is the one purpose gasoline. The Standard Oil Company (Indiana) makes in its own refineries, many different kinds of gasoline for various purposes. Red Crown is made for the one purpose of producing power in the modern internal combustion engine. Therefore, there is not a wasted drop and more miles per gallon are obtained.

Testimony from thousands of Red Crown users all of whom are enthusiastic about the power and economy of Red Crown is proof that it is the gasoline which you should use.

Send for this free book on gasoline

A few minutes spent in reading it, will give you a clear understanding of the essential factors which go to make good gasoline. It will show you how to buy gasoline on the basis of service it renders you. It will be sent free on request.

tinguished from bonds. A stockhold the right to vote, to participate in div if declared, to attend stockholders' ings, and to examine corporate rec addition to any other rights which charter or by-laws of the corporation provide.

Common stocks are issued with or with par value. Shares of stock are issued wi a par value as low as $.10 and as high $1,000 or even larger multiples. By value, I mean stock with a definite fa value or amount indicated on the face it. In recent years there has been a gro ing tendency to issue stock of "no par va ue" representing merely so many shar outstanding, the aggregate of which rep sents the total proprietary interest of t stockholders; the value of an individua share being determined simply by dividi the amount of the proprietary interest b the total number of shares outstanding.

Preferred stock is more or less of hybrid partaking of the nature of stock and likewise in some ways of the nature of a bond, but unlike common stock, the preferred carries a certain fixed dividend rate varying from six to eight per cent on a par value of $100. The latter is preferred over the common stock as to earnings and usually as to participation in the assets. Preferred Dividends are commonly cumulative that is, if a dividend is not earned it need not be paid, as with bond interest, but carries over the following year or years until such a time as the earnings of the company make it possible to resume dividend payments.

Ordinarily, it is not until after current as well as accumulated preferred dividends have been paid off that the common stock is entitled to receive anything. Oftentimes preferred stock may carry with it a participating feature entitling it to receive an additional dividend where excess profits are earned sharing in a certain ratio with the dividends declared on the common.

While preferred stocks do not have any fixed maturity, provisions are sometimes made in the indenture under which the company agrees to retire all of the preferred stock outstanding on or before a certain date, and a great many preferred stock indentures today include a callable feature, making such retirement optional with the company. In addition to the callable feature other features are sometimes found such as provisions preventing creation and sale of obligations senior to preferred shares while there are any of the latter issue outstanding, provisions for the maintenance of a certain ratio of assets to liabilities; as to payments into a sinking fund for the extinction of the preferred issue, or certain provisions as to the ratio of dividend requirements to earnings before issuance of additional preferred stock of similar character.

A bond may be defined as a written promise to pay, under seal, a specified sum of money at some definite future date with interest payable at a fixed rate at definite intervals during the life of the instrument. Bonds are usually issued in the denomination of $1,000, although in recent years

GEN. PUBLIC—PARTNER

An Interview with Philip L. Thomson

nership with public utilities or business dislocation and ir- able harm to everyone—these alternatives are set before ople of the country by Philip L. Thomson, president of the ation of National Advertisers, who has been speaking to entative groups in many cities. Mr. Thomson is publicity ger of the Western Electric Company. He stresses the in- , personal relationship of every individual and every com- y to the utilities.

a representative of a typical industry with branches all over nited States," Mr. Thomson says, "I can say that manu- ers fear to locate factories where light, power, transporta- nd communication facilities are not ample. When they find where the utilities are not being allowed franchises and sufficient to enable them to earn a fair return, they turn away se they are looking for locations where there is community ony, where the people have learned that their interest is al with that of their utilities.

uring the war we had a costly experience letting the govern- run the railroads and the telephone and the telegraph. To- ve see the Shipping Board still running the merchant marine loss. You and I are making up this loss with taxes that we'd to see reduced.

he true form of public ownership is found," Mr. Thomson "where the people of a community invest their savings in ies which furnish them as customers with light, transportation mmunication.

s a stockholder in your local light company you want only ir return for the money you have invested, and as a customer ask only adequate service at fair rates. In other words your rest as owner and customer is identical. Fortunately many stments of this character are now open throughout the country. This is an example of the satisfactory result of what I like to community harmony. Fundamentally there isn't any reason the various interests in a community cannot work together their common good. When labor and the employes of labor the merchants and the Chamber of Commerce and the Rotary the Kiwanis Clubs and the public utilities and the city or nty officials and the granges learn the value of sitting down und the table on a give-and-take basis, then there is no power earth strong enough to hold back the development of that com- nity."

Mr. Thomson describes three stages in the history of public ties. First they were experiments. It took nerve to put money projects so shadowing as a transcontinental railroad or a phone enterprise. Naturally there were some abuses and over- italization.

Reading a lesson from the experience of Cleveland, one of ny cities where a municipal lighting plant has failed in com- ition with a private one, and of Akron, Toledo and other ies where an attempt has been made to do without street cars til conditions became intolerable, Mr. Thomson points a con- st to the right method—harmony.

To show how partnership works, he refers to the bank of the otherhood of Locomotive Engineers, organized as a protest ainst Wall Street, which has just joined with one of Wall reet's leading investment houses in an issue of bonds for a West- n railroad. The significance of this step he characterizes as un- istakable.

"The great national utility which calls for your support now ore than ever before is our transportation system. The railroads e rendering the greatest service of any single utility at the west margin of profit.

"The enormous volume of freight that flows over the rails moves cheaply that you can hardly find the cost of railroad trans- rtation in the goods which you buy. The railroad will carry suit of clothes three of four hundred miles for six cents, a pair shoes a like distance for five cents, a ten-pound ham from Iowa Boston for seven cents. In fact, nothing is so cheap as adequate ansportation.

"The best hope for railroads now is a cessation of legislative terference, and a continuance of confidence and support."

We Prosper

Only as you prosper; therefore we take a pride in the excellent finish of your product.

With our increased facilities we are now able to give excellent service and solicit the opportunity to figure on your polishing, nickel plating and buffing requirements.

ADJOURNMENT

So far as constructive legislation is concerned—that is, le lation which can be passed by this Congress with any hope presidential approval—this Congress can easily adjourn the f week in June.

The House has a few appropriation bills yet to enact and t Senate has settled itself to the tax debate. So far as outw appearances go there are no obstacles to legislation being throw the way of important measures but neither is there any intima that the democratic-progressive alliance will permit an adjo ment until all the bills they are interested in have been voted up Thus far the democrats are showing a tendency to permit a journment before the conventions, but the political developme of the next month will go further toward determining that question than any other factor in sight. If the democrats sudden determine to keep Congress going until mid-Summer or late Fall the progressives will help them do it.

THE REPUBLICAN CONVENTION

Out of a list composed of Secretary Hughes, Senators Borah, Wadsworth, Representatives Longworth and Burton, Frank O. Lowden and Gen. Charles G. Dawes is expected to come the choice of President Coolidge and the Republican national committee for temporary and permanent chairmen of the national committee and probably the choice for chairman of the resolutions committee as well.

The president has been leaning toward Senator Borah for temporary chairman but some of Senator Borah's friends have made some impossible platform demands as the price to pay for this service. The committee on arrangements of the convention wants Secretary Hughes. If there is to be a compromise Frank O. Lowden at this writing may be the man.

Senator Wadsworth stands out as a likely choice for chairman of the platform committee and W. M. Butler of Massachusetts is the leading candidate for chairman of the national committee.

SOVIET FOREIGN TRADE

The total foreign trade of Russia in 1923, calculated at 1913 prices, amounted to only 12 1/10 per-cent of the total exports and imports of the old empire in 1913, according to the report of L. J. Lewery, assistant chief of the Eastern European Division of the United States Department of Commerce. Mr. Lewery says, in part:

"The last three months of the calendar year 1923, with their large exports of grain, definitely turned the balance of Soviet Russia's foreign trade in its own favor. Although the final results for the fiscal year ended September 30, 1923, appeared doubtful and controversial, owing to the present Russian system of valuing all commodities imported and exported at 1913 prices, the heavy increase in exports during the last quarter of the calendar year, together with a systematic restriction of imports, left a substantial favorable balance of trade beyond question, whether valued at pre-war or at current prices.

"The valuation of all imports and exports in gold rubles at pre-war market price had been rendered necessary because the rapidly depreciating Soviet currency furnished no stable medium for calculation and comparison.

"Imports for the calendar year 1923, figured at the 1913 prices, were valued at 144,100,000 rubles, against exports of 205,800,000 rubles, giving a favorable balance of 59,700,000 rubles. On the basis of approximate current prices instead of 1913 prices, exports total 307,300,000 rubles and imports 200,100,000 rubles, making the favorable balance on a current-price basis equal roughly to 107,200,000 rubles."

The Relation of Accounting to Management

R. ERSKINE Assails Bearish Propaganda

BEARISH propaganda which, he charged, is "deliberately intended to undermine confidence, frighten security holders and hurt business, was denounced this week by A. R. Erskine, president of the Studebaker Corporation, speaking at the Ninth Annual er of the Illinois Manufacturers' Costs Association, in the LaSalle, Chicago. Mr. Erskine declared that confidence lso been weakened this winter by the dilatory attitude of ress toward tax reduction but that it seemed now ready to

is extremely easy to disturb business by undermining con- ce," said Mr. Erskine. "When this is done unemployment es with the misery it entails. For the last ninety days the try has been flooded with bearish propaganda intended to rmine confidence, frighten security holders and hurt the busi- of the country. It is still being carried on. It was and is nctly and deliberately hostile to the business of the country, e prosperity of the nation and to the happiness of our people. Business frequently is assailed and sometimes penalized be- e it is big, whereas the truth is that our big industries are the ones that have made our country what it is. Big business e difference between the United States and the rest of the ld.

America was not industrially great with its small industries hirty years ago. I remember when industrial workers were ing from ten to twenty cents per hour, when a few owned r homes and men who owned bicycles were considered fortu- . Big business has made it possible for workers to own modern es, automobiles, talking machines and radios. Big business made necessities out of luxuries by mass production which them within the reach of the average man. Big business has anced the living standard of America to a high level before nown in history. It has converted America into the world's atest industrial nation and made our big cities what they are.

'All great modern nations have been industrial nations, and ustry is the life blood of this nation. Big business, lawfully nducted, is the greatest asset of the nation. Every governmental ency and the power of the people should always be exerted vard its maintenance and prosperity."

Mr. Erskine, emphasizing the importance of accounting to nagement, said in part—

"When big factories with mechanical appliances, employing merous men, began displacing hand work, the industrial era rted, and accounting became complex. The rapid multiplica- n of such industries increased the problems, and it soon be- me apparent that manufacturing accounting was the most diffi- lt task that had yet faced the bookkeeping fraternity. The bject was most baffling.

"The old merchandise account was continued, to which, you ill remember, goods made or purchased were charged at cost, d sales were credited at selling prices. Costs of product were timated by crude methods, and inventories were priced at these sts. Inventory periods were dreaded because of the difficulties pricing, closing down, and making up balance sheets and trad- g accounts. Balance sheets and profit and loss statements in the mprehensive and intelligent form of the present day were un- nown. Audited and certified statements such as are now com- only required were likewise unknown, and it is safe to say erhaps that statements really correct were seldom obtained.

"Manufacturers naturally sought men skilled in accounting ractice to help them out, and while such men knew more than e bookkeepers employed by the manufacturers, they had but a cant knowledge of modern accounting as we know it today. These ccountants, however, enjoyed a lucrative practice, formed a pro- ession, and studied hard.

"As the first great modern industrial country, it was natural that

Manufacturing Locations for Sale

Along the line of the Chicago, West Pullman and Southern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad, the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound, with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Chicago, West Pullman and Southern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

For complete information, including rates for transportation and prices of land, apply to

T. J. MALONEY, General Freight Agent

England should first appreciate the importance of accoun and dignify men engaged in it publicly by state recogniti England has the distinction of first creating by law the Charte Accountant, about two generations ago, and of establishing a- counting on a high professional plane, approaching that of la Professional accountants were meantime practicing in the Unit States, and by 1896 they succeeded in having the legislature of the Empire State pass a law recognizing the profession, under whi the Board of Regents examines applicants and grants C. P. A. certificates to successful candidates. All of our forty-eight stat now have C. P. A. laws. All examinations include commerci law subjects as well as accounting.

"It was about 1896 that our big industries began forming. The Certified Public Accountants of the country have performed highly efficient and comprehensive work in the installation of new systems, improvement of existing systems, standardization of balance sheets, profit and loss statements, auditing methods, etc. Big business could not have prospered as it has without the aid of these men, and it cannot get along without them today. Our federal government has used them in the formation of laws and accounting systems in connection with the Inter-State Commerce Commission, the Internal Revenue Department, and many others. They have performed invaluable services for our railroads, mercantile and financial institutions, and thousands of income tax payers depend upon them to make out their returns. Bankers, stockholders, and investors demand their certification of corporation balance sheets, profit and loss statements, and prospectuses.

"In defining the word "profession," Webster says "the three professions, or learned professions, are especially theology, law, and medicine." He includes neither chemistry, engineering, nor accounting, which are so important to the conduct of business. Theology and medicine give their greatest expression outside of business and in our home life, but law, chemistry, engineering, and accounting subsist on business and are a part of it. Professional accountants play their part, as has been said, but vocational accountants employed by industry are responsible for results in individual institutions.

"The comptroller or general auditor of a corporation should be an expert accountant. He should know the theory and practice of general accounting as well as the professional, and infinitely more about the problems of his own concern. He is the diagnostician of the business. His bump of curiosity is of abnormal development, and he takes nothing for granted. He knows what is going on. He is resourceful, courageous, aggressive, and determined to get the facts and disclose them to management. Although he is a bold man, he must be tactful in order to keep the friendship and get the cooperation of the organization. No man is stronger than the organization, and tactful men realize this. The best comptroller is one who calls the attention of management verbally, or by special letter, when it fails to act on a dangerous situation.

"The treasurer of a big corporation should be an expert accountant, and have the courage of a lion. The real treasurer, as I comprehend him, is the man unafraid, when danger threatens, to say 'no' to his president or his board when occasion demands, and show them why. He should be prepared to accept dismissal rather than permit grave risks to be taken. If the treasurers of all the corporations of America during 1919 and 1920 had been this type of man, most of the inflation and huge losses of business would have been avoided. We all know of several presidents who ran their corporations head over heels in debt during this period without realizing the significance of their actions at the time. This fact is one of the best evidences of the importance of accounting to management that I can cite.

"The responsibilty rests on the comptroller in cooperation with the treasurer of every corporation for the character of its accunting system, for therein lies the secret of success. Some systems are almost choked to death with red tape. They anger the production and sales departments, puzzle the accounting forces, cost a barrel of money, and are Greek to the management. Capable comptrollers will not permit such systems to endure. To be of real value, accounting systems must be comprehensive, simple, and economical. They must not clutter up the factory with time tickets, material tickets, and other minutiae. Departmental records must be kept only as the basis for operating reports that are ly required by management. When the cost of keeping ls and making reports exceeds the loss that might be sustained ıt them, they become inadvisable.

g business generally is equipped with efficient accounting ıs which comprise, in brief, (1) original records kept in ent departments showing receipt and disbursement of money; asing, stocking, and use of materials and supplies for pro- on, construction, and equipment; the movement of finished ; and collection and payment of accounts; (2) operating ts made from said records for the information of manage- ; and (3) financial reports for the information of manage- . directors, and stockholders. These reports, made daily, ly, and monthly, show what has happened in the business. nless management thoroughly understands them, however, uses them to correct wrong conditions and take further ad- ıge of opportunities they disclose, their value is diminished. ıgement should possess at least a good working knowledge counting. *The possession of even brilliant talent for manu- ring or selling or both is not enough.*

here are many details of big business which management watch vigilantly. Plant equipment and methods of manu- re may be economical and proper or otherwise. The number nployes, salary and wage rolls, kinds and cost of materials, and prices of product, markets and sales efforts, financial ition and profits, are always live questions. Reports from ccounting department disclose the facts concerning them all. Every member of management from the foreman up to the ident should be an analyzer of reports and a seeker after rovements. These things illustrate the importance of account- to management. They show why it is impossible to conduct ısiness intelligently and successfully without an adequate ac- ıting system.

While such systems generally prevail in big corporations, ıy smaller concerns are woefully lacking in accounting facili- . Such concerns will bond their cashier to prevent him from ling the cash in the bank or the cash drawer, and maintain no ks whatever on their inventories or receivables which usually resent three-fourths or more of their total assets. On the theory a dollar saved is a dollar made, they spend money reluctantly. y think only of amounts and never in percentages. When s can be increased by an increase in the amount of expenses hout increasing the expense ratio, they seldom appreciate the ortunity. When new machinery or new methods will justify scrapping of old equipment, they may never realize it. Mod- accounting methods are adaptable to such concerns, whether y be engaged in manufacturing, jobbing, or retailing, and will their cost if operating reports are properly utilized by the nagement.

"It is my conviction that efficient accounting systems applied business generally in the United States and used intelligently management would save scores of millions of dollars annually."

NEW C-P-A LAW

Only accountants certified in New York State are to be allowed practice in that state under the McGinnies Bill, which has t passed both houses of the state legislature. The new law is pected to materially affect a great many existing contracts tween local manufacturers and their accountants.

According to M. L. Seidman, a New York certified public ac- untant, the McGinnies Bill was formulated for the purpose of aking up for an oversight in New York's original public account- g law. This law, passed twenty-eight years ago, made no ovision prohibiting non-certified accountants from practising, r was any provision made in it to prevent practice by those rtified in other states, wherein requirements were less exacting.

The McGinnies Bill gives all practising public accountants not rtified in New York an opportunity to become certified without amination, provided that, by January 1, 1925, they can satisfy e New York State board of regents that their experience, edu- ition and character warrant waiver of the examination require- ents. All those who do not qualify by January 1 will be pro- ibited from practicing in New York thereafter.

OVERHEAD

By JOHN C. NAYLOR

Comptroller, Pet Milk Company (St. Louis)

THE necessity for standard rates of burden is beyond dispute. The difficulty lies in the determination of normal production and normal overhead expenses.

Many experts have suggested that a plant is operating under normal conditions when it is operating at about 80 to 90 per cent of its capacity. The exact percentage, of course, will vary with each individual plant, but it is very important to avoid using, as a normal capacity, a capacity that will be reached only in times of war or of unusual prosperity. The normal year for a new industry is, of course, different from that of an old one. Furthermore, it should not remain on a dead level, but should curve upward gradually with the growth of markets; thus, the normal year for 1924 will not be the same as the normal year for 1923, but will be larger or smaller, depending upon the growth or lack of growth of the company.

The length of the cycle is frequently one year, because a year is usually a period sufficiently long to take into consideration the seasonal variations and the heavy expenses which may be incurred in some months. The calendar year, however, should be ignored completely when it is necessary to include a longer period in order to equalize either the amount of production or the amount of expenses. Some industries use a cycle of three to five years, in order to take care of such repairs as mentioned in connection with the relining of blast furnaces. The important thing to remember, however, is that the period must be long enough to obtain a true average.

After a standard rate of overhead has been obtained the question of distribution to the product becomes important, whether in normal or abnormal times. Various methods of distributing overhead have been used and, while it is not the purpose of this discussion to compare the accuracy of these various methods, some mention should be made of their merits and defects, in order to discuss the methods which have been suggested for distribution in abnormal times.

We are all familiar with the method of distributing overhead on the basis of the material cost, under which plan the burden applied to a product is in direct proportion to the cost of material which enters the product. This method is very inaccurate, as each product does not make equal use of all the factory facilities. Furthermore, expensive materials are burdened with entirely too much overhead, the overhead expenses, of course, having no connection with the cost of the material.

If the overhead is distributed in proportion to the direct labor used in connection with a job, too much overhead will be charged to the work done by high-priced workmen. This method also fails to make any distinction in the kind of equipment used, and a job requiring $10.00 of labor done by a man with a file will receive just as much burden as a job requiring the same amount of labor of a man employed on a large boring mill.

Even if the overhead is distributed on the basis of labor hours, great inaccuracies result in many cases, for, although many expenses are a direct function of time, numerous other expenses incurred in connection with the different kinds of equipment are not proportional to time, and some distinction must be made in the equipment used. The purpose of the machine rate is to make this distinction in the kind of equipment used.

Under this method each machine or group of machines (known as a production center) is considered as a small shop. The total expenses of operating this production center are obtained and the cost per hour is calculated after considering the probable hours of operation. Since there must always be a certain error in the estimate of the hours which the machines will be operated, it follows that any condition which will cause the machines to be idle will result in the accumulation of overhead expenses which will not be distributed to the product. In order to remedy this defect of the machine rate, A. Hamilton Church suggested the use of a supplementary rate for distributing those expenses that were not distributed by the machine rate, due either to those general shop expenses which could not be allocated to machines or production centers, or to an error in estimating the number of operating hours on account of the idleness of machines, etc.

The chief merits of this plan are that the supplementary rate serves as a barometer of factory efficiency, and focuses attention on the cost of idle machines and equipment. Although this method has been accepted as a big improvement over the straight machine rate, the faults of the method are numerous.

In the first place, the costs of idle machines and equipment are charged to the factory management, when they are not always responsible for this idleness. Conditions entirely beyond their control may be responsible for the small amount of work being handled. In the next place, it is very difficult, under this method, to compare operating costs. The costs are low when the production is high and, of course, are high when the production is low. The variations caused by outside influences are so great as to distort the cost statements and make it impossible to determine the

Why the current saving—the added years of service—with FAIRBANKS-MORSE ball-bearing motors?

IN the dust and heat of hundreds of mines, Fairbanks-Morse ball-bearing motors are proving the increased economy of their better service. Freely spinning steel balls carry the motor load.

You can let a Fairbanks-Morse ball-bearing motor run a year without touching the bearings. Then, just flush out the bearing with kerosene and repack with grease—20 minutes' work for one man. Savings in power, bearing and lubrication quickly absorb the installation cost and pay a profit.

Felt wipers keep the grease in and the dust out. There is no oil drip to destroy insulation, damage belting or increase fire risk. Users report that failures due to oil and mechanical troubles are reduced 75 to 95 per cent. This dependability is especially desirable for the severe service of manufacturing use.

proportion of the excessive cost that is due to poor management and the proportion that is due to outside influences.

Furthermore, if such costs are to be used as a basis for quoting on new business in time of depression, the securing of any orders will practically be prohibited, because it is impossible for the sales department to sell more than the concern's normal overhead. If an attempt is made to sell at the higher prices, a smaller number of orders will be taken, and the problem, already acute, will be accentuated by the decreasing amount of production; in fact, if this method should be persisted in, a concern would soon be placed in the position of preferring to buy its products, instead of manufacturing them, in such periods of depression.

If a manufacturer had a dozen plants and two of them were not being operated, he would never consider charging the production of the ten plants with the idle time expense of the two plants that were not operating. Yet there is no difference in principle between applying costs in this way over the production of twelve plants, than in the case of twelve departments which are probably under one roof or at least known as one entity.

A theory recently announced, known by various names and sponsored by various men, recognizes the fact that outside business conditions have a vital bearing on the running hours of machinery and equipment, and attempts to remove this charge from the operating cost and place it in the administration or general section of the profit and loss account. Under this plan the costs are charged only with the percentage of total burden that the curtailed production is of the standard production.

For instance, let us consider a plant whose normal overhead is $5,000, whose normal production is 10,000 units, and whose actual production for the period in question is 5,000 units. This would mean that the plant is operating at 50 per cent capacity, and costs would, under this method, be charged with 50 per cent of the overhead, or $2,500, the remaining $2,500 being charged directly to Profit and Loss. It seems that several men have laid claim to originating this theory, but it is not within the province of this discussion to determine the original author of this plan. It is sufficient to say that the plan is sponsored by C. H. Scovell, H. S. Gantt, J. P. Jordan and others.

Under this plan the overhead accounts are charged with the actual overhead expenses, and credited with the amount of overhead distributed to the product on the basis of the normal overhead rate. The overhead accounts, therefore, in a sense become reserve accounts, the accounts showing a large credit balance in times of high production, and either a small credit balance or a debit balance in times of low production.

How to guard against installing such a worthless system is outlined by Mr. Naylor in his concluding article NEXT WEEK.

OUR FUTURE EXPORTS

A Statement by Secretary Hoover

OUR future exports in manufactured goods lie largely in those goods where we manufacture on a mass basis," Secretary of Commerce Hoover stated in a recent hearing before the house interstate and foreign commerce committees.

"We can sell goods of standardized character against any comer in world trade wherever we are producing such goods by large and continuous manufacture founded on a large domestic consumption.

"It has been thought for a number of years that one of the reasons why our manufactures have been slow in foreign trade was our inability to adapt our goods to the conditions and demands of foreign countries. As a matter of fact, our future trade in manufactured goods must be based upon an abandonment of this idea.

"We can sell our goods—our standardized goods—in competition with others. But we cannot adapt our manufactures to local demand and still compete. Adaptation increases the cost of production and places us at a disadvantage.

"We can meet the cheap labor of Europe by our higher skill in mass production through organization. Our problem is one of education to establish demand for our standardized goods throughout the world."

Butler Heads Industrial Club

Rush C. Butler is the new president of the Industrial Club of Chicago, elected this week to succeed George A. Ranney. Other officers chosen include Howard W. Fenton, vice-president; Frank H. Warren, secretary; William M. Blair, treasurer, and Joseph C. Belden, Theodore F. Morseles, George A. Ranney, R. Douglas Stuart, and Joseph T. Ryerson, directors.

G-M-C Earnings Decrease

The General Motors Corporation sold 212,572 cars and trucks in the first quarter of 1924, compared with 176,258 in the 1923 period. The quarter's net earnings, after charges and taxes, were $19,280,000, equivalent after prior dividends to 85 cents a share on the common stock. Net earnings in the 1923 quarter were $19,406,000.

"The consumers' demand in the spring of 1923 exceeded all previous records and this year is equal to and probably 10 per cent greater than last year," President Alfred P. Sloan stated. "Due to unseasonable weather, spring buying is just getting under way. Our plants are being operated at slightly over 80 per cent of sales for the first quarter.

"The policy of running plants at the peak during winter and spring enabled us to supply dealers and distributors with sufficient cars to meet spring requirements and to slack off operations during the summer months to that point necessary to cover the lesser demand during that season of year."

FOREIGN TRADE

Current Requests from European Buyers

hundred tons of rosin and 150,000 pairs of shoes for men and women are among ie commodities sought in America by foreign buyers this week.

n addition are seven requests for lumber of various description, thirteen requests iachinery and engines, and six for automobiles and automotive accessories. Motor- 1 fire apparatus is requested from Spain, where plans for the modernization of ur- ire fighting apparatus are going forward.

Confidential information concerning any of the week's opportunities in foreign mar- nay be obtained by any manufacturer who will write to MANUFACTURERS NEWS g the serial number of the item concerning which the information is desired.

Requests from abroad received this week are—

RIA—
2. Tobacco leaves and siftings.
RALIA—
1. Concrete block-making machinery.
RIA—
3. Rosin, 60 carloads of 10 tons each.
ARY ISLANDS—
1. Southern yellow pine. Shooks for it packing.
LAND—
9. Mahogany lumber and plywood. Oak wood. Oak and mahogany sliced veneers 0 inch thick. Redwood lumber. Soft- od core stock.
PT—
7. Bakery machinery. Engines, Die- , crude oil.
MANY—
9. Automobiles, small, motorcycles.
32. Apple flavor oil.
12. Beans.
58. Birls of hickory and walnut also peg- od.
84. Chemicals, heavy. Turpentine.
012. Canned milk. Flour. Fruits, dried. ain. Lard.
009. Fruits, dried.
012. Pork.
85. Rosin, 5 to 10 tons monthly.
019. Shoes, cheap. Shoes, workmen's.
020. Shoes, 150,000 pairs, for men and omen.
90. Tobacco in barrels.

JAMAICA—
9966. Straw for making hats. Straw hat-making machinery.
MANCHURIA—
9962. Machines for making copper coil section of syphon trap.
MEXICO—
9969. Engines, tractor type and steam boilers. Sawmill, portable, complete.
9968. Hosiery manufacturing machinery. Yarn, hosiery.
NETHERLANDS—
9991. Kentucky lugs. Tobacco stems. Virginia and Maryland tobacco.
POLAND—
9996. Agricultural machinery. Tires and tubes, automobiles. Automobile parts and accessories.
9997. Automobile frames, transmissions. differentials, and axles.
9970. Knitting machines, hand, for wool and silk.
9994. Tire-inflation machinery, mechanical.
SOUTH AFRICA—
9975. Boot-making and shoe repairing machinery. Rubber soles. Rubber heels. Rubber specialties.
SPAIN—
10002. Fire-fighting apparatus motor driven.
SUMATRA—
9964. Engines, marine, oil. Motor boat and yacht fittings. Machine shop equipment.
WALES—
9989. Paraffine scale and wax. Turpentine.

Continued from Page 16

of the nation, a provision could be ed that any farmer employing one or if essary two hired men could be excluded m the payment of the tax.

'I am bitterly opposed to our present m of taxation because of the fact that nakes for poor Americanism. It makes public dishonesty.

'I strenuously object to any tax system t requires a perfect army of people to minister, who are non-producers and o are educated at public expense to be- ne leeches on the business interests of nation. Almost every morning one eives some form of circular from a vyer or accounting firm advising how y have been successful in getting tax luctions.

"Any system of taxation that brings out the possibility of men fattening on hnical knowledge must carry with it the vitable assumption that there are peo- e who are paying an excessive tax as ainst those so technically buttressed as take advantage of every quirk of the w to escape payment.

"The payroll tax surely would avoid all is and if so framed that it could not be ssed along at a profit would make for tter Americanism. It is the easiest unit business on which to frame a non-es- pable tax structure."

Western Electric Sales Increase

Orders booked by the Western Electric Company (Chicago) during the first three months of 1924 amounted to $80,591,000—an increase of $12,793,000 over the first quarter of 1923. Billings of the company for January, February and March of this year amounted to $68,246,000—exceeding by $16,480,000 the total for the corresponding period of 1923.

Cotton Spinning Declines

Cotton spinning activity again declined during March, according to the census bureau's report, made public this week. Active spindle hours for the month totalled 7,072,965,368—an average of 187 per spindle in place—as against February's total of 7,304,102,954—an average of 194 per spindle in place. Active spindle hours for March, 1923, totalled 9,531,002,951—an average of 255 per spindle in place.

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

into heels.

"There is some encouragement in the fact that while women's shoes and men's shoes were not using the leather of yesteryear, shoes for children of from one to fourteen are using just as much leather as ever and everybody engaged in the manufacture of children's shoes finds business good.

"Another encouraging factor is the return of many automobile manufacturers to all-leather upholstering in place of fabric, which has been found unsatisfactory. Also, although the passage of the horse from city streets has been attended by the disappearance of a great deal of harness, there is greater demand than ever for harness on farms. Too, the demand for all leather belting is excellent, tests having shown that the traction qualities of leather belting is at least double that of other material.

"Despite these few remaining good prospects, however, it must be observed that. unless the American people will demand pure leather and swing back into sanity, the leather business will find itself in severe straits. To the man well shod, the world is covered with leather. There are few torments that exceed the wearing of an ill-fitting shoe. America has led the world for over fifty years in the production of quality leather and the American people are the best shod of any people in the world. But unless we can respond to the needs of the leather market, I am afraid we will lose our reputation for superior shoes.

"And it is inevitable that if many leather manufacturers are forced out of business, higher prices will result, for the few who survive will undoubtedly exact them."

Better Business Seen

Business will be much better after the presidential nominations are out of the way, James A. Campbell, president of the Youngstown Sheet and Tube Company, told stockholders at their annual meeting. He said the slowing of demand in the first quarter this year probably is due to Congress and more particularly to the Senate investigations.

"The country got investigations instead of speedy tax relief," he said, "and yet business is not bad. It is fairly good considering the circumstances."

The company's business in the first quarter of 1924 showed "satisfactory results," though it was lightly below the first quarter of 1923. The decline in earnings was due, he said, to increased productions, costs and lower selling prices.

Westinghouse Sales Increase

Preliminary figures of the Westinghouse Electric and Manufacturing Company's incoming orders for the quarter ended March 31, 1924, indicate a total of $37,755,000, compared with $45,760,000 for the quarter ended March 31, 1923. Sales billed for the March 31, 1924, quarter aggregated $43,660,000, compared with $38,900,000 for the quarter ended March 31, 1923.

Continued from Page 20

particularly since the Liberty Loan campaigns, the $500 and $100 denominations have found favor. A bond is usually one of an exactly similar number, the aggregate of which makes up the "bond issue" and all covered by the same indenture. The maturity of a bond varies, the shortest maturity usually being ten years and running as high as one hundred years, or even longer. In fact, there are some bonds in the nature of perpetual loans which have no maturity, such as the British Consols and the French Rentes, gradual retirement of which is accomplished through the operation of a Sinking Fund every year.

Notes are distinguished from bonds by their shorter maturity, usually from one to ten years, and by the nature of their security. Notes constitute a temporary form of financing and being such are rarely secured by a mortgage lien, but usually by a lien on collateral or merely the general credit of the issuing corporation. Bonds and Notes may be classified according to the nature of their security, by lien on real property, by lien on collateral or unsecured. Bonds or notes of the latter type are called "debentures."

The agreement under which bonds and note are issued is called an "indenture." It is legal written document, often very lengthy, which defines the rights of the borrower and lender and contains all of the terms and conditions of the loan as between the issuing corporation, the trustee with whom this document is deposited. and the bondholders.

The trustee, who is appointed, holds this indenture in trust and during the life of the loan has conditional title to the property pledged pending payment of principal. when due, and the periodical installments of interest. Failure to pay either principal or interest when due constitutes a violation of the indenture and permits the bondholders to collect by taking legal action to secure possession of the property.

Ask Bids for Dredging River

Bids for the dredging of a part of the North Branch of the Chicago River are being sought by the United States Engineer Office, 537 S. Dearborn St., Chicago. Sealed proposals will be received at that office until 10 a. m., Standard Time, May 22, and then opened. Full information may be obtained from the Engineer Office.

Admitted to Board of Trade

Frederick L. Hannah (Ottumwa, Ia.) has been elected to membership in the Chicago Board of Trade, according to an announcement by officials of the board this week.

Ask $2,490,100 Stock Issue

The Alton & Southern Railroad (East St. Louis) has filed an application with the Illinois Commerce Commission requesting authority to issue $2,490,100 of common stock.

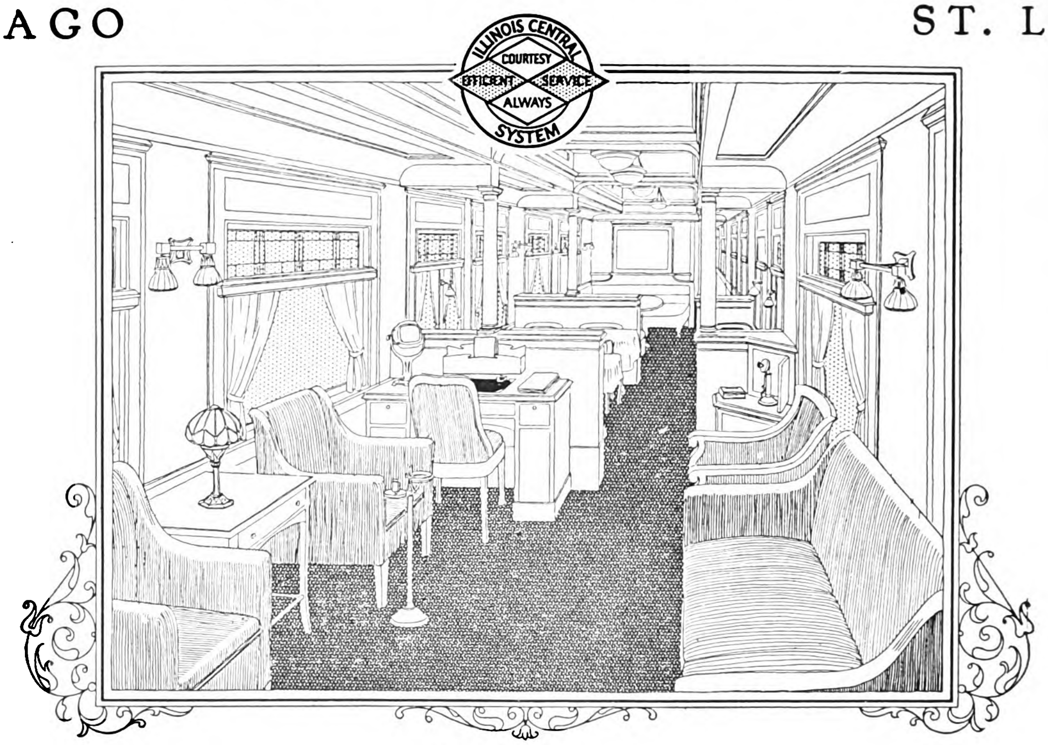
Travel Luxury

CHICAGO ST. LOUIS



Introducing

THE SALON-BUFFET CAR

on The Diamond Special

Here, at last, is a car as luxurious as a palatial hotel, as correctly appointed as a modern club. Conventional car interiors were avoided; celebrated designers were given a free hand. The Illinois Central again adds to your comfort and is confident of your approval.

Rich walnut interior; ivory ceilings; luxurious carpets; tasteful window draperies; commodious armchairs and deep-seated circular lounges for friendly groups.

The spacious shower bath and dressing room, telephone and valet are all innovations in overnight service. Many other novel appointments.

Luncheon served after 9:30 p. m., also a varied breakfast menu in the Salon's buffet.

All equipment of the Diamond Special is of the same high standard.

The Salon-Buffet Car is a unique feature of the Diamond Special service. Lv. Chicago 11:30 p. m. Train ready 9:30 p. m. (Chicago daylight saving time one hour later.) Ar. St. Louis 7:23 a. m.

Illinois Central

Manufacturers News is published every Saturday by Glenn & Company, 231 So. La Salle St., Chicago, Illinois. Subscription price $4.00 a year; 10 Cents a copy. Entered as second class matter March 4, 1912, at the Post Office at Chicago, Ill., under act of March 3, 1879.

Therefore, when we build, let us think that we build * * forever. Let it not be for present delight, nor for present use alone, let it be such work as our descendants will thank us for, and let us think, as we lay stone on stone, that a time is to come when those stones will be held sacred because our hands have touched them, and that men will say as they look upon the labor and the wrought substance of them, 'See! this our fathers did for us.'

Masters of Syncopation

IN the Grill Room of the Congress a *Paul Whiteman* band plays daily for your pleasure. *The Collegians,* under the direction of *A. Vincent Gauthier,* play for luncheon, dinner and supper each day except Sunday, when they give a dinner concert from six until nine.

The Congress has always been a popular rendezvous for after-the-theater parties. It is unusually well-liked since the advent of this talented group of musicians. They have come with that rare sense of rhythm and harmony that has made the name of their guiding master famous the world over. Enjoy an hour or two with them in the Grill Room.

MOTHER'S DAY

SOMETHING—perhaps it is the touch of God, or Good,
That's in us all — something, I say,
Prompts us to pause. Our factory wheels are stilled,
Our crowded thoughts with business details filled;
Clear and speed home: 'Tis Mother's Day—
A day of homage, of respect, to Motherhood.

MOTHER! Oh, aye! the debt is ours and ours alone:
Owing, we never can repay
Her tender care and tenderer sacrifice,
Her constant watchfulness, her sound advice . . .
MOTHER! What sweeter word to say!
MOTHER! What sweeter phrase has human thought e'er known!

—JOHN BRADFORD MAIN

PLAY—GOLF!

By "CHICK EVANS"

I AM convinced that a movement should be started in America to improve the business man's standard of play, for I am informed that the average score of the business man golfer is 105 strokes for 18 holes.

That is rather terrible golf.

do not believe that a man ooting 105 can get anywhere ar an average amount of fun actual playing. There is an old ying that "he gets more exer-e," but there is little in this cept a jocular attempt to enurage the unskillful.

The business man of Great itain could give the business an of America a stroke a hole. at, in itself, proves something.

The business man golfer needs fining. Some of our best amaur players are as successful and experienced usiness men as many who stand high in busiess and go around in 150. But my writing day concerns that large and rather vague class f players who are in business and play golf—ften and not well.

They blame their poor playing on lack of me. But time spent in improving one's health not time lost. Therefore any business man an spare time to play a better game. It means resh air and exercise in the open.

In these days when there are so many golf ourses, it is comparatively easy to find a place play. But if a man would make his business uccessful, he must apply himself systematically nd steadily to it; and so it is with golf.

It does not particularly matter whether one lays once a week or seven times, just so he does t steadily throughout the season and gives it ome thought.

If I were a business man playing a poor game of golf, and vanted to remedy it, I would do about as follows:

First, I would see that my clubs were in good condition so hat I couldn't blame them for my poor shots—and let me tell ou that there are clubs poor enough to spoil any good shot.

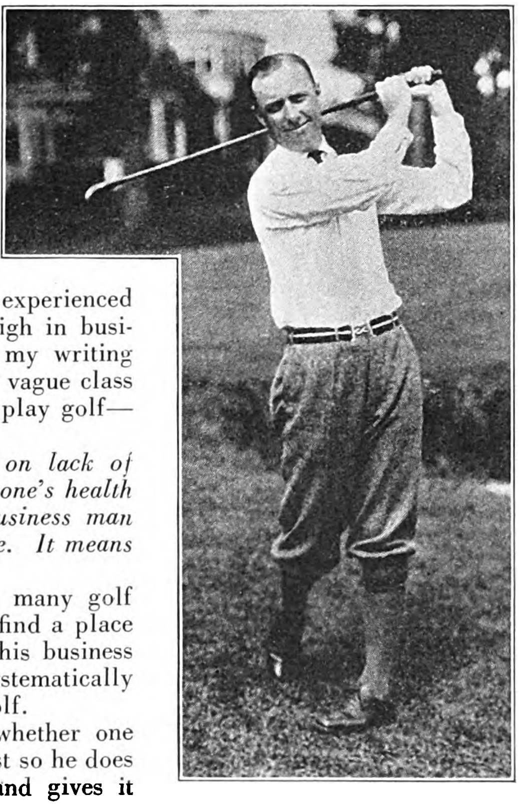
Then I would decide in my own mind that I was going to improve. This would make me give more careful thought to my play. The result, I am sure, would be to lead me to simplify my game—and herein lies my chief advice to the business man golfer:

Let simplification be the keynote to your play!

Now, I would determine one grip and keep to it throughout the season. For myself, I use the finger grip—that is, the leather gripping is in my fingers, and the fuller the shot the more narrow the section of my thumbs resting on the leather.

Incidentally, I might add that I like to grip the leather about midway. I do not overlap, or interlock, because my fingers are short and I believe that women and short-fingered men should get as full a grip on the club as possible. A large hand with long fingers is useful in golf, and you will find that most good players have such hands—but one must use what he has to the best advantage. Of course, there are other good grips, but I cannot go into them in this article.

JUST EVANS



The next thing to do, having decided upon the grip, is to select a stance. I like a square stance best—that in which your feet are on an approximately straight line. If freer motion is needed, open the stance a little bit. I play the ball about off the left heel.

I have described some of my methods of playing, but the only thing I want to impress upon the reader is that, after he has gone to his professional and got the proper ideas, he should stick to them and simplify his game throughout the year.

By all means, he should avoid taking advice from one who doesn't know—the world is full of poor advice on how to play golf.

Every man has his special difficulty. I wish that I could help him overcome it. Remember, it is more necessary to study each shot and to simplify methods than to practice. But as much as possible, try over and over again the right ideas.

There are about five major ones that can be kept in mind each day, and one's individual body should be worked around them. These ideas may vary from day to day, but five are enough to take on at one time.

I advise all players to avoid idle experimenting.

I believe that the business man golfer may have a great year ahead of him. The American nation is learning to play golf. That means greater health and greater efficiency and business undoubtedly will benefit thereby.

All things are better for a clear and healthy mind. The American business world is the better off for golf. But it is well to set a better standard of play. Then Mr. Golfer will not have to take it out on his wife or his employes because his game is bad.

Playing well, however, is not the only thing in golf. It is not even the chief thing. Friendship comes first, for after all only a few can come out of the heap and be great players. The rest of us must play well enough to be good company and enjoy that serenity of mind that proceeds from a good game.

I advise, therefore, that the business man golfer resolve to be a companionable playmate rather than a great player. Let us play seriously—but not too seriously. By all means let us learn the etiquette of the game. As each year increases the number of players, there is, above all, increasing reason to remember this, that selfishness on the course is one of the most unbearable acts.

THE "MELTING POT"

Second Article on Training Factory Foremen

By J. K. NOVINS

ONE of the greatest problems in modern industry is the assimiliation of the factory foreman in the scientifically organized factory plant.

The modern plant is a veritable melting pot which swallows up the old-time foreman and produces an entirely new product. Yesterday he was the "gang boss," today he is the "key man of industry."

New developments in industry give rise to new problems. The inauguration of an era of machine production called for an army of technically trained men. Colleges and universities inaugurated special departments to train such men. In the course of time these men influenced industrial development. Factory production became specialized.

The new development called for trained workers. This gave rise to the need for vocational education in schools, and in manufacturing plants. Trade schools became an important factor in industry. The larger manufacturing plants formed regular training departments so as to assure a reserve of skilled labor. Especially during the war, when the scarcity of skilled labor was so keenly felt, was the strongest impetus given to industrial training of workers.

During the past few years a new condition has arisen. The scientific organization of the plant forces, the standardization of operators' tasks and the installation of cost systems—all these factors have created demand for a new type of foreman. The old-type foreman must therefore be assimilated into the modern factory organization before the foreman and the organization can function properly.

Whereas the old foreman was concerned merely with production in his particular shop or department, even though the production was earned at the expense of inefficient management of the men under his charge, the foreman in the modern factory organization is concerned over a multitude of production factors.

He stands between the management and the men. Aside from securing production he must properly interpret the management's policies to the men. He must cooperate with the management in the reduction of operating expense and in the elimination of waste. He must analyze working methods in his department in order to suggest improvements to the management. He even must cooperate with the sales department by suggesting and effecting improvement in the quality of the product and help furnish estimates on costs.

The labor problem in a modern factory is complex. The foreman must exercise tact and knowledge in handling his men. He is concerned over such problems as safety devices, the filling out of daily records, the training of the new worker and ways and means of getting operators to make suggestions for improvement in production.

Realizing this need a number of factory organizations several years ago began to interest their foremen in special training courses. Special study groups were formed, which the foremen were to attend of their own initiative. The foremen listened to lectures by executives in the organization and by outside speakers. The foremen were shown what an intricate yet simple organization a modern manufacturing plant is.

"Indeed, during the past few years no phase of industrial training has received more attention than the development of foremen," says H. C. Link, an authority on employment management. "It must be admitted that this recognition has been somewhat belated, but this is being atoned for by the energies which are now being expended."

The training of foremen is yet in its primary stage. While most factory executives are aroused to the urgent need of foreman training, they have been slow in developing a standard technique for such training.

This phase of the work has been studied in detail by Dr. Roy W. Kelly, former director of Harvard University bureau of vocational guidance and at present manager of industrial relations for the Standard Oil Company of California. Dr. Kelly recently submitted a report on the subject to the Federal Board of Vocational Education.

BURNS AND SCALDS

Their Treatment in Cases of Emergency

By CAPT. G. R. C. FISHER

VOTE: Capt. Fisher is in charge of in- tion and lecture-work for the safety irtment and accident prevention bureau ve Illinois Manufacturers' Mutual Casu- Association.—EDITOR.)

THE annual death rate from burns and scalds stands out in startling boldness in our national casualty lists. A recent statistical report shows that, it as are the fatalities from the auto- bile they are exceeded by burns. The st pathetic item is that mothers and little ldren under school age constitute 82 cent of the whole.

his is due to the fact that shock is ally present. This serious added con- on, because of the lack of immediate t aid or medical attention, quickly, tells the vitality of the victims and they are n beyond human help. Therefore, in burns, whether from one cause or an- ter, the treatment must be immediate, d always the excluding of the air from burnt or scalded area, since it is the ion of the air striking the affected parts iich greatly aggravates the sufferings.

Burns are classed thus: First degree rns, which merely cause a reddening of skin; second degree burns, which al- ys show blisters and third degree burns, charring of the flesh. A first degree rn or scald affecting all or nearly all of body, is usually fatal, but even these treme cases might be saved if immediate tion could be taken.

There are a few very bad practices too ld commonly among only too many rsons, and I wish to correct them. For stance, pouring cold water on a burn. *ne may safely and most effectively place burnt hand into hot water (i. e., the tem- rature of the body 98°)* but never in old, as this would cause a serious shrink- ng of the parts which seldom could be rrected. The exception to this rule is at in cases of acid or strong alkali burns. old water may be used in such cases as eans of staying the action of the burning quids.

It is an unfortunate fact that many per- ns think that to smear a burnt part with our water is just right. If they could but now what that means to the surgeon, in e removing of the caked and hardened ass, to say nothing of the sufferer who has endure the added torture of having it raped off his burned flesh! It might be ell at this point, while we are touching pon negatives, to mention the fact that e medical world is against the use of ils in treating burns, especially of the extensive kind, because oil has a tendency to retain heat; and then too, because it becomes rancid and, in reaction acid.

It would not be quite fair to include "carron oil" among clear oils. "Carron oil" consists of 50–50 raw linseed oil and lime water, and while it is rather smelly, yet nevertheless it is an excellent first aid application for severe burns, since it affords much comfort to the victim. Too, we must not ignore the fact that, in the case of the acid or strong alkali burn, the first aid dressing should be that of oil. "Carron oil" may be used in an acid case, clear oil in the alkali case.

[*Note: My use of the term "the first aid dressing" or "treatment" always means what should be done immediately and before the doctor comes.*]

"In applying dressings to burns or scalds, never use absorbent cotton. It sticks to the parts and is difficult to remove. Use gauze, clean pieces of cotton or old linen. When applying a dressing to a large area, such as the cheek, abdomen or back, instead of putting one large piece, use strips, say six to eight inches wide, overlapping as applied, so that the dressing will conform to the shape of the part affected. The burn is easier redressed and not too much of the parts are exposed to the air.

For all burns or scalds, quickly cut off draughts from the victim, and as rapidly as possible apply the dressing so as to exclude the air.

In burns of the hand, submerge in hot water until the dressings are prepared. A solution of baking soda (salaratus-sodium-carbonate—carbonate of soda) is usually quite easily obtained, prepared and applied; or carron oil, or unguentine. Some first aid directions teach that baking soda be applied as a paste; that is not a good method because it dries, cakes and falls off. Rather, make a saturated solution, soak the dressing, apply to burn and keep the dressing wet from the solution.

Be careful to see that each finger is dressed separately, otherwise the burnt parts stick together.

When clothing adheres to the burnt flesh, care must be exercised in rendering first aid, not to pull off as the skin is likely to be carried with it, simply cut around adhering fabric and soak with oil or rub in vaseline, lard or butter and apply dressing over all.

In case of a burn on the face, cut a mask with holes for eyes, nose and mouth, and smear with unguentine, carron oil, or preparations such as castor, olive or sweet oils, vaseline, lard or butter. Baking soda must not be applied to the face as it would get into the eyes and cause no little added distress.

Three distinct steps must be taken in treating acid and strong alkali burns. First, the burning fluids must be stayed by either thrusting into water or dashing water on the affected parts. Second, the fluid must be neutralized, or killed in the case of an acid, with a weak alkali such as pure alcohol, lime water, baking soda water, or strong laundry soap suds. In the case of a strong alkali, pure ammonia, or concentrated lye, use a weak acid such as diluted vinegar, lemon, grape-fruit or orange juice. If there are blisters, sterilize a sharp knife or razor and open carefully to let out the serum. Third, apply an oil dressing—"carron oil" especially in an acid burn, any clean oil in either case, but particularly with the alkali burn.

In the case of an electric flash burn of the eye, quickly place a compress soaked in boric acid, lime water, or even saline solution—salt water. Take the victim into a dark place. Get castor oil and carefully drop a little into each eye. A small bit of unguentine salve placed in each eye is better still and wonderfully soothing. Replace the wet compress and get medical aid.

[*Note: Do not keep unguentine or any salves in jars; it soon fouls by the repeated opening of the lid, or what is worse, the use of the fingers to dig it out. Keep it in collapsible tube form.*]

Quicklime in the eye requires quick treatment. If possible remove the lime. but lose no time in dropping in diluted vinegar or lemon juice, etc., and follow with castor oil or unguentine salve.

Acid in the eye should receive treatment as follows: Squirt in a little water, follow with lime water and oil as above. If ammonia, or lye, squirt with water, follow with diluted vinegar or lemon juice, and lastly, the castor oil or unguentine. Always protect with wet compress, and insist on medical treatment following the first aid remedies used. In all industrial plants where acid or alkali hazards exist, there should be kept on hand in first-aid cabinets boric acid solution, lime water, castor oil and unguentine, with a supply of sterile gauze for compresses.

Friction burns such as those caused by buffing wheels, belts or from sliding down a rope, may be treated by washing affected parts carefully with boracic acid solution and applying a liberal dressing of carron oil or unguentine. *For gasoline scalds* such as are caused by soaked clothing, apply a dressing with baking soda solution.

In case a child's, girl's or woman's clothes catch on fire—

Continued on Page 23

OUR ITALIAN-AMERICAN CITIZENS

By ITALO E. CANINI

Vice-President, Italian Chamber of Commerce (Chicago)

(NOTE: This is the last of three articles by Mr. Canini in defense of America's traditional welcome to foreign immigrants. Mr. Canini deals specifically with that angle with which he is best acquainted—the Italian immigrant to the United States—but his findings and conclusions may well be applied to immigrants of all nations, many of whom have risen to important and respected positions in all walks of America life.—EDITOR.)

THOSE who maintain that the son of an ignorant immigrant must perforce be ignorant himself would do well to consider the many clubs, particularly in the East, among students of Italian blood, in the Colleges and Universities. The federation of these clubs in New York is known as the Italian Intercollegiate Association. They are also numerous and prominent in several Greek Letter fraternities.

Augusto Rotoli was the founder of the Boston Conservatory of Music. Is it necessary to remind any Chicago reader of what Cleofonte Campanini did for musical culture in the United States? Gatti-Casazza is his counterpart in New York. Some fifty years ago, Ettore Barrili, a half-brother of Adelina Patti, and the brothers Pasquale and Ferdinando Rondinella were the leading teachers of vocal music in Philadelphia. Eliodoro De Campi was the first to teach the "bel canto" in Chicago; his daughter Anita is a well-known writer in Chicago newspapers on Interior Decoration. To mention only a few of those, in Chicago, who are now continuing his work: Profrs. Umberto Beduschi; Vittorio Arimondi; Francesco Daddi; Ettore Titta Ruffo; all former members of the Chicago Opera Company; Buzzi-Peccia, now of New York. Giuseppe Vecchione, a notable orchestra leader, and composer of exquisite music. Creatore and Ferullo share with Sousa (who, I believe is a Portuguese) the distinction of being the most widely known bandmaster in the country.

Italians are well represented in medical science in the United States. Dr. Verdi of Washington, D. C., was a prominent physician during the Civil War, and for many years after it; was appointed president of the Board of Health of the District of Columbia in 1876, and was the author of several works, in English and in Italian. His book "American Life" published in Milan in 1894, awakened much interest in Italy. Prof. Massaglia, formerly of Northwestern University, and now in South Dakota, is a bacteriologist of world-wide reputation. Dr. A. Stella, of New York, is a well-known physician, and writer on medical and other subjects. He is the author of "Some Aspects of Italian Immigration," published by Putnam's. Dr. Paolo De Vecchi, formerly of San Francisco, and now of New York, is another practitioner and writer of note. Space forbids mentioning the names of other distinguished specialists throughout the country, several of whom have a much more than local reputation. In Chicago, the veterans in the profession are Dr. Antonio Lagorio, founder of the Chicago Pasteur Institute, and at one time president of the Public Library Board, and Dr. Camillo Volini, head of staff of the Columbus Extension Hospital, which was established some ten years ago by Mother Maria Cabrini. The younger element comprises many physicians who after having done their duty in the world war established a practice in Chicago, as Dr. Aurelio Pagano, Galli of Columbus Hospital, De Luca, De Feo, Italo Volini, a son of Dr. Camillo, and many others.

The name of members of the Bar, of Italian birth or descent, in the United States, is legion. In Chicago they are so numerous that they have an association of their own: the Justinian Society of Advocates, founded by John De Grazia, and of which Philip Quillici is now President. Italians, or their sons, are not wanting on the Bench. In New York, John J. Freschi is a judge of the Court of Special Sessions, Francis X. Mancuso, of the Court of General Sessions; Salvatore Cotillo, former State Senator, is now a member of the New York State Supreme Court. In Chicago, we have on the Municipal Court Bench, Judge Bernard Barasa, the popular judge of the renters court, who delights in describing himself as "the son of a poor Michigan miner"; Borrelli, and Lupo. Albert Gualano was also on this Bench for sometime.

A greater number of men of Italian blood than is generally known have been or are now, in public life. Former Governor Longino, of Mississippi, and U. S. Senator Taliaferro, were of it. Antonio Camminetti, of California, Congressman, State Senator, Commissioner of Immigration in the Wilson administration. Fiorello La Guardia, Representative in Congress, then president of the Board of Aldermen of New York City, now again represents his district in the Congress. Stefano Malato, of Chicago, was a member of the Illinois Legislature, and afterwards Assistant State's Attorney. Charles Coia was, and Frole and D'Urso are now, members of that Legislature. There are numerous men of the same race in the Legislatures of many other States. Angelo Paonessa is Mayor, and Anthony S. De Renzis, Health Commissioner, of Bridgeport, Conn. The heads of the municipalities, and many officials of the latter, in a great number of the smaller cities and towns are Italians.

The pioneer of Italian language journalism in the United States, was Giuseppe Secchi de Casale, who founded the "Eco d'Italia," in New York, in 1849. Volleys of undeserved abuse are daily being fired at the Foreign Language press, although it is in reality, with few exceptions, one of the best means of Americanization of the immigrant. It should not be forgotten that the newcomer, unless he be from Great Britain, does not understand the language of this country, nor is this gift suddenly conferred upon him as by the operation of the Holy Ghost; until he has acquired it his only means of information is through the newspapers written in his native language. The leading Italian newspaper in the Middle West is "L'Italia," published in Chicago by Oscar Durante, with the aid of an able editorial staff. Mr. Durante was at one time United States Consul at Catania, then Rome correspondent for the Chicago Tribune. The "Tribuna Transatlantica," also of Chicago, is edited by Alexander Mastrovalerio, founder of the Italian agricultural settlements of Daphne and Lambert, Ala., whose quaint humor, backed by a large fund of solid culture and general information, endears him to his readers. These gentlemen have for the last thirty-five or forty years been spreading the Gospel of Americanization, and devoting their energies, their time, and much valuable space in their papers to the promotion of every patriotic American cause. Ettore Patrizi, of the San Francisco "L'Italia," has been doing the same work on the Pacific Coast since 1894. The only thankful recognition they have received for their labors is to be apparently included in the general denounciation of the foreign language press. The newspapers written in Italian having the largest circulation are, of course, published in New York. Carlo Barsotti, promoter of many charities and of beautiful monuments, to which funds he is himself a generous contributor, publishes since 1878 the Progresso Italo-Americano. The "Bollettino della Sera" (Evening Bulletin) is another newspaper having a wide circulation; its editors are V. Giordano, president of the Italian-American Republican League, and Dr. Paolo Parisi, of the University of Rome. Less than two years ago Luigi Barzini, famous journalist of Milan, established the "Corriere d'America." His articles reveal an insight into our most intricate problems truly wonderful in a man whose residence here has been so short. In their news service, their editorials, their Sunday magazine and rotogravure sections, these newspapers are not inferior to any of the great metropolitan dailies. "Il Carroccio" (The Battle-Chariot) is a monthly magazine, edited by Agostino De Biasi, in Italian and English; many prominent American and Italian writers are contributors to

A DISTURBED CONGRESS

The Week's Developments in Washington

By JOHN M. TOWNSEND

Special Correspondent, MANUFACTURERS NEWS

PRESIDENT COOLIDGE'S steady march forward as the outstanding republican candidate for the presidency this year, together with the indorsements given him in the popular primaries despite the democratic attacks upon him in the senate and the attacks upon republican administration by Senator Hiram Johnson of Cali- nia on the stump, have had a sobering effect upon Congress a whole.

While the opposition of the democrats and the progressive ublicans to the Coolidge legislative recommendations remains, l while the coalition is still control of both houses of ngress and eager to play litics with any legislation be- re the legislative body, the esident is manifestly stronger roughout the whole country in his opponents reckoned d they are plainly worried it the headway they have tem- rarily made against the ad- inistration in this Congress ll not last until election day.

THIRD PARTY GOSSIP

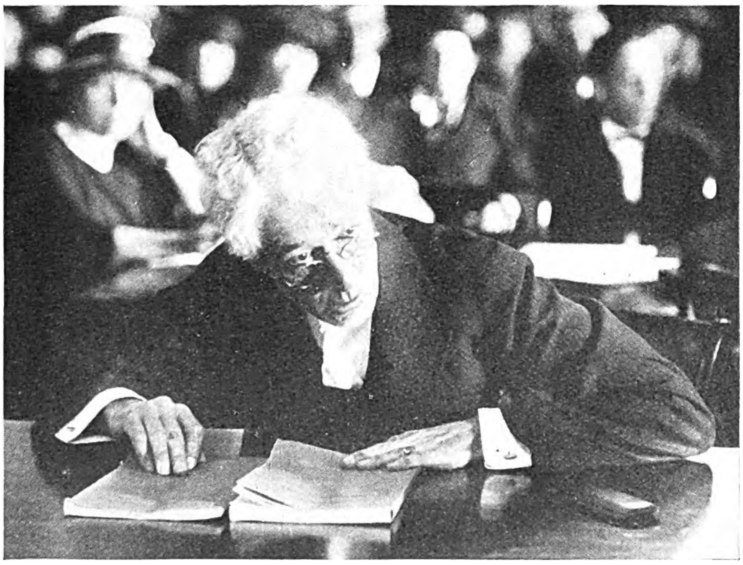
Talk of a third party in the esidential contest this year is ginning to lag in Washing- n.

The first damper of conse- uence put on the enthusiasm r a third party organization as been the failure of Senator iram Johnson of California to ake substantial headway gainst President Coolidge in e popular primaries. If there any lesson to be derived from e Johnson effort it is that a iddle-of-the-road progressive as little or no chance with the lectorate this year and that a ird-party, if there is to be one hich will attract any consider- ble number of votes, must be n the main essentially radical in character.

On the other hand there is a real row on among the component lements of the proposed third party. There is to be a progres- ive convention held in Cleveland on July Fourth, toward which he third party advocates lean with far greater persuasion than oward the radical convention called to meet in St. Paul. If Minnesota and the Dakotas are to be kept in line for third party urposes, the St. Paul convention cannot be wholly ignored, yet he Minnesota Farmer-Labor senators have withdrawn their sup- ort from it and Senator Brookhart of Iowa has also intimated that f he is renominated for senator by the republicans of Iowa he will have nothing to do with a third party movement.

This situation reduced to fundamentals, means that the LaFol- ette group in Congress is more intent on maintaining its balance of power in both houses than it is on any other phase of the political problem this year. Its members are not rampant on making a third party fight which may lose them the offices they hold and they would rather remain in the republican party and hold their jobs and do as they are now doing than take a chance with a third party which can do no more than throw the presidential contest into the House at best. Furthermore, they have had the fact demonstrated to them that even a presidential candidacy as well financed as was that of Senator Johnson at the outset has been futile and the financial backing for a third party now in sight is meagre to say the least.

LANDIS INTERROGATED



The appearance of Former Judge K. M. Landis of Chicago before the Brookhart investigating committee in the Grossman pardon case provided the country with a major sensation this week. C. W. Middlekauff of Chicago, special assistant to the attorney-general, appeared unexpectedly before the committee later in the week and told the senators that Judge Landis made statements "which I claim are untruthful and unwarranted and misleading," and that the pardon of Philip I. Grossman, Chicago saloonkeeper, was "the most righteous pardon ever granted by any President."

DEMOCRATIC TROUBLES

The democratic party leaders today have no notion who will be the party nominee for president.

The democrats are divided into two camps just as strongly as the republicans and their predicament is enhanced by the two-thirds rule in the democratic convention which will prevent a real majority from imposing its full will on a majority. The progressive element of the west is represented in the McAdoo candidacy and the ultra-conservative element of the east is putting in its best licks for Gov. Al Smith of New York, Senator Underwood and John W. Davis. These factions disagree on the liquor issue, on the Klan issue and on the kind of a candidate who should be nominated to oppose Mr. Coolidge and there is no dove of peace in sight anywhere as yet.

William J. Bryan, as usual, is lurking in the background on the liquor issue and, whether he is a delegate to the convention or not, his influence will be felt both during the convention and in the campaign.

Whether or not there is to be a third party depends as much on the outcome of the democratic convention as it does on the republican convention. While Senator LaFollette and his friends have not said they would support a progressive democrat, the fact remains that the outstanding advocates of a third party today are all nominal republicans who await the action of both national conventions.

COOLIDGE COOLNESS

Perhaps the chief disturbing factor in the equation for both the democrats and progressive republicans at this time is the fact that President Coolidge is wholly ignoring the efforts of Congress to take the limelight before the country and is moving straight ahead to perfect the machinery of the Cleveland convention and of the campaign.

Having the nomination in hand the President has joined with the national committee in selecting Representative Theodore E. Burton of Cleveland as the temporary chairman of the convention, and he has announced the selection of his personal friend, William M. Butler of Massachusetts as his choice for Chairman of the national committee upon the retirement of John T. Adams in June. The selection of Mr. Butler means, however, that the Coolidge campaign for reelection is now under way at a time

GOOD TIMBER

MEREDITH NICHOLSON'S hat is in the ring. He seeks nomination for state senator in Indiana. The New York *Times* declares that Mr. Nicholson's friends and neighbors "ought to be glad of the chance" to nominate him "unless wit and sense and brilliant intelligence and long thought on the problems and policies of democracy are considered disqualifications."

Unfortunately for Mr. Nicholson and his friends and neighbors, that is too often the case. The Indiana legislature may need men of Mr. Nicholson's calibre, but the party may need a man of greater political influence.

That is one of the misfortunes of our present system of government.

Mr. Nicholson is both a gentleman and a scholar. We would like to see a man of his mental equipment and unquestioned character seated in the Indiana—or any other—legislature.

His platform, short and to the point, is doubly appealing. He promises, if elected, "not to introduce a single bill nor be for the passing of any more laws until we catch up with the ones we already have."

That probably won't set well with the requirements of Mr. Nicholson's party. Nor with those of any party. Legislation is the life of political maneuvering.

HOGS IS—ASSETS

INCREASED consumption of pork, due largely to the efforts of the packers—Armour & Company, Swift & Company, Wilson & Company and the Cudahy Packing Company and others—has saved many a farmer from bankruptcy during the last few months.

The farmers owe the packers a vote of thanks.

A hog is a hog—and a liability—until it is converted into ham, pork chops, pickled pigs' feet and sausage. Then it becomes an asset.

The packers provided the farmer, who turned to his hogs as his last recourse, with a ready market. There was no ruinous break in prices. More than 81,532,600 "liabilities" were turned into assets during 1923—thirty per cent more than in 1919.

The average price paid for live hogs was only one and two-thirds per pound less than that paid the previous year. There were no wide fluctuations. Prices were stable throughout the year.

F. Edson White, president of Armour & Company, informs us that, due to the efforts of the packers to find a market for the farmers' "liabilities," consumption of pork was increased one pound per capita per month last year.

This service could not have been rendered without the national distribution provided by the packers, who, in the past, have been the targets of farmer criticism.

For once, the farmer has been served—and served well.

It is this sort of service—this sort of cooperation—that was emphasized last June in the Farmer-Manufacturer Convention held in Chicago under auspices of the Illinois Manufacturers' Association.

DANGER!

CAREFUL reading of S. 2646 (Howell-Barkley)—the bill to abolish the United States Railroad Labor Board—indicates that its closed shop provisions may be made to extend to every manufacturer and dealer in railroad equipment and supplies.

All industry will be harmed by the passage of this closed shop, high-wage fixing measure, especially manufacturing plants in cities where railroad shops are situated.

This Railroad labor bill now under consideration by the Senate Committee on Interstate Commerce is backed by the Railroad Labor Brotherhoods. Its real purpose, it is believed, is to unionize 100 per cent of all railroad employes. A strict interpretation of the measure might give the unionized boards of adjustment, to be organized under its provisions (especially No. 2 shop and mechanical workers) jurisdiction over the employes of all institutions existing in furtherance of the interest of carriers.

Section 1, devoted to "definitions," states that the term "carrier" includes all "bureaus, associations, committees and institutions of whatsoever kind or character maintained or supported by or existing in furtherance of the interest of carriers."

Paragraph 6 of Section 1 specifies that the terms "employes" and "subordinate officials" mean all persons engaged **** "including all persons in the employ of bureaus, associations, committees and institutions of whatsoever kind or character maintained or supported by or existing in furtherance of the interest of carriers."

This interpretation of the act already has been brought out at one of the hearings on the bill. If the measure becomes a law, it is susceptible of the interpretation we have emphasized, although lawyers differ on this point. A judge friendly to organized labor easily could hold that the act applied to employes and subordinate officials of any manufacturer or dealer in railroad material.

OXYGEN EXPLOSIVES

A COMPREHENSIVE series of field tests of liquid oxygen explosives is being conducted by the Department of the Interior from the Pittsburgh, Pa., and Tucson, Ariz., experiment stations of the Bureau of Mines.

This work has to do with the development of efficient methods of using liquid oxygen explosives in mines, quarries, etc., and includes a study of the adaptability of such explosives for use in deep, large-diameter down holes, and blasting in drifts in metal mines, using different "dopes" in the cartridges, different methods of firing, and different methods of charging. A California company has furnished samples of diatomaceous earth, and another California company has furnished samples of oils for determination of the desirability of use of these products in the "dope." A Denver company is cooperating with the bureau in the development of "dopes," wrappers, dipping and carrying containers, absorption and evaporation tests.

Blasting in drifts, tunnels or open cut workings has been initiated and will be continued.

There is need for a cheap, adequate and prompt domestic supply of cartridges containing "dopes" and having certain desirable characteristics, as high absorption power, high degree of retention, and containing variations in composition in order to produce liquid oxygen explosives having physical characteristics suitable for particular uses.

NEW STANDARDS

The Relation of Government to Business

By Secretary of Commerce HOOVER

NOTE: This is an address delivered by Mr. Hoover this week the annual meeting of the Chamber of Commerce of the United ites in Cleveland. The concluding installment will appear XT WEEK.)

ADVANCEMENT of science and our increasing population require constantly new standards of conduct and breed an increasing multitude of new rules and regulations. The basic principles laid down in the Ten Commandments and the Sermon on the Mount e as applicable to-day as when they were declared, but they quire a host of subsidiary clauses. The ten ways to evil in the ne of Moses have increased to ten thousand now.

A whole host of rules and regulations are necessary to maintain man rights with this amazing transformation into an industrial a. Ten people in a whole county, with a plow a piece, did not bow each other very much. But when we put seven million ople in a county with the tools of electricity, steam, 30-floor ildings, telephones, miscellaneous noises, street cars, railways, otors, stock exchanges, and what not, then we do jostle each her in a multitude of directions. Thereupon our lawmakers pply the demand by the ceaseless piling up of statutes in tempts to keep the traffic open; to assure fair dealing in the onomic world; to eliminate its wastes; to prevent some kind of buse or some kind of domination. Moreover, with increasing ducation our senses become more offended and our moral disriminations increase; for all of which we discover new things remedy. In one of our States over 1,000 laws and ordinances ave been added in the last eight months. It is also true that a rge part of them will sleep peacefully in the statute book.

The question we need to consider is whether these rules and regulations are to be developed solely by Government or whether hey cannot be in some large part developed out of voluntary orces in the nation. In other words can the abuses which give ise to Government in business be eliminated by the systematic nd voluntary action of commerce and industry itself? This is ndeed the thought behind the whole gamut of recent slogans Less Government in Business," "Less Government Regulation," A Square Deal," "The Elimination of Waste," "Better Business thics," and a dozen others.

National character cannot be built by law. It is the sum of he moral fibre of its individuals. When abuses which rise from ur growing system are cured by live individual conscience, by nitiative in the creation of voluntary standards, then is the growth f moral perceptions fertilized in every individual character.

No one disputes the necessity for constantly new standards of onduct in relation to all these tools and inventions. Even our latest great invention—radio—has brought a host of new questions. No one disputes that much of these subsidiary additions to the Ten Commandments must be made by legislation. Our public utilities are wasteful and costly unless we give them a privilege more or less monopolistic. At once when we have business affected with monopoly we must have regulation by law. Much of even this phase might have been unnecessary had there been a higher degree of responsibilty to the public, higher standards of business practice among those who dominated these agencies in years gone by.

There has been, however, a great extension of Government regulation and control beyond the field of public utilities into the fields of production and distribution of commodities and credit. When legislation penetrates the business world it is because there is abuse somewhere. A great deal of this legislation is due rather to the inability of business hitherto to so organize as to correct abuses than to any lack of desire to have it done. Sometimes the abuses are more apparent than real, but anything is a handle for demagoguery. In the main, however, the public acts only when it has lost confidence in the ability or willingness of business to correct its own abuses.

Legislative action is always clumsy—it is incapable of adjustment to shifting needs. It often enough produces new economic currents more abusive than those intended to be cured. Government too often becomes the persecutor instead of the regulator.

The vast tide of these regulations that is sweeping onward can be stopped if it is possible to devise, out of the conscience and organization of business itself, those restraints which will cure abuse; that will eliminate waste; that will prevent unnecessary hardship in the working of our economic system; that will march without larger social understanding. Indeed it is vitally necessary that we stem this tide if we would preserve that initiative in men which builds up the character, intelligence, and progress in our people.

I am one of those who believe in the substratum of inherent honesty, the fine vein of service and kindliness in our citizenship. The vast volume of goods and services that daily flow through the land would cease instantly were it not for the instinctive dependence of our people upon the moral responsibility of the men who labor in the shops and farms and the men who direct our production and distribution.

In these times of muddled thought it is sometimes worth repeating a truism. *Industry and commerce are not based upon taking advantage of other persons. Their foundations lie in the division of labor and exchange of products.* For through specialization we increase the total and variety of production and secure its diffusion into consumption. By some false analogy to the "survival of the fittest" many have conceived the whole business world to be a sort of economic "dog eat dog." We often lay too much emphasis upon its competitive features, too little upon the fact that it is in essence a great cooperative effort. And our homemade Bolshevist-minded critics to the contrary, the whole economic structure of our nation and the survival of our high general levels of comfort are dependent upon the maintenance and development of leadership in the world of industry and commerce. Any contribution to larger production, to wider diffusion of things consumable and enjoyable, is a service to the community and the men who honestly accomplish it deserve high public esteem.

The thing we all need to searchingly consider is the practical question of the method by which the business world can develop and enforce its own standards and thus stem the tide of Governmental regulation. The cure does not lie in mere opposition. It lies in the correction of abuse. It lies in an adaptability to changing human outlook.

The problem of business ethics, as a prevention of abuse is of two categories: those where the standard must be one of individual moral perceptions, and those where we must have a determination of standards of conduct for a whole group in order that there may be a basis for ethics.

The standards of honesty, of a sense of mutual obligation and of service, were determined 2,000 years ago. They may require at times to be recalled. And the responsibility for them increases infinitely in high places either in business or Government, for there rests the high responsibility for leadership in fineness of moral perception. Their failure is a blow at the repute of business and at confidence in Government itself.

The second field and the one which I am primarily discussing is the great area of indirect economic wrong and unethical practices that spring up under the pressures of competition and habit. There is also the great field of economic waste through destructive competition, through strikes, booms and slumps, unemployment, through failure of our different industries to synchronize and a hundred other causes which directly lower our productivity and employment. Waste may be abstractly unethical but in any event it can only be remedied by economic action.

If we are to find solution to these collective issues outside of Government regulation we must meet two practical problems:

First, there must be organization in such form as can establish the standards of conduct in this vast complex of shifting invention, production, and use. There is no existing basis to check the failure of service or the sacrifice of public interest. Some one must determine such standards. They must be determined and held flexibly in tune with the intense technology of trade.

Second, there must be some sort of enforcement. There is the perpetual difficulty of a small minority who will not play the game. They too often bring disrepute upon the vast majority; they drive many others to adopt unfair competitive methods which all deplore; their abuses give rise to public indignation and clamor which breed legislative action.

I believe we now for the first time have the method at hand for voluntarily organized determination of standards and their adoption. I would go further; I believe we are in the presence of a new era in the organization of industry and commerce in which. if properly directed, lie forces pregnant with infinite possibilities of moral progress. I believe that we are, almost unnoticed, in the midst of a great revolution—or perhaps a better word, a transformation in the whole super-organization of our economic life. We are passing from a period of extremely individualistic action into a period of associational activities.

Practically our entire American working world is now organized into some form of economic association. We have trade associations and trade institutes embracing particular industries and occupations. We have Chambers of Commerce embracing representatives of different industries and commerce. We have the labor unions representing the different crafts. We have associations embracing all the different professions—law, engineering, medicine, banking, real estate, and what not. We have farmers' associations, and we have the enormous growth of farmers' cooperatives for actual dealing in commodities. Of indirect kin to this is the great increase in ownership of industries by their employes, and customers, and again we have a tremendous expansion of mutualized insurance and banking.

Although such associational organizations can trace parentage to the middle ages, yet in their present implication they are the birth of the last 50 years, and in fact their growth to enveloping numbers is of the last 25 years. We have, perhaps, 25,000 such associational activities in the economic field. Membership, directly or indirectly, now embraces the vast majority of all the individuals of our country. Action of wide import by such associations has become an important force of late in our political, economic, and social life.

It is true that these associations exist for varied purposes. Some are strong in recognition of public responsibility and large in vision. Some are selfish and narrow. But they all represent a vast ferment of economic striving and change.

Ever since the factory system was born there has been within it a struggle to attain more stability through collective action. This effort has sought to secure more regular production, more regular employment, better wages, the elimination of waste, the maintenance of quality or service, decrease in destructive competition and unfair practices, and ofttimes to assure prices or profits. The first phase of development on the business side was "pools" in production and distribution. They were infected with imposition upon the public and their competitors. In some part they were struggles to correct abuse and waste. They were followed by an era of capital consolidations with the same objects, but also to create a situation of unbreakable agreements. Both were against public interest and the public intervened through the Sherman Act. Yet underneath all these efforts there was a residuum of objects which were in public interest.

Associational activities are I believe driving upon a new road where the objectives can be made wholly and vitally of public interest. The legitimate Trade Associations and Chambers of Commerce with which I am now primarily concerned, possess certain characteristics of social importance and the widest differentiation from pools and trusts. Their membership must be open to members in the industry or trade, or rival organizations enter the field at once. Therefore, they are not millstones for the grinding of competitors as was the essence of the old trade combinations. Their purpose must be the advancement of the whole industry or trade, or they cannot hold together. The total interdependence of all industries and commerce compels them in the long run to go parallel to the general economic good. Their leaders rise in a real democracy without bosses or political manipulation. Citizens cannot run away from their country if they do not like the political management, but members of voluntary associations can resign and the association dies.

I believe that through these forces we are slowly moving toward some sort of industrial democracy. We are upon its threshold, if these agencies can be directed solely to constructive performance in the public interest.

All this does contain some dangers, but they will come only from low ethical standards. With these agencies used as the machinery for the cultivation and spread of high standards and the elimination of abuses, I am convinced that we shall have entered the great era of self-governing industry and business which has been a dream to many thinkers.

To be continued

Continued from Page 9

when the democrats have no idea who their candidate will be and when the progressives have to wait until July to determine whether or not they will launch a third party.

It is already clear that the President and his friends have the jump on their opponents by at least a month or two. This kind of precision makes both the democrats and progressives nervous. While they are rowing with the administration and then among themselves, the President is making progress in a constructive way.

This situation is affecting the psychology of Congress. While the democrats and progressives still hate the Mellon tax reduction bill and the Senate would like to write a brand new bill of its own, the tendency in the upper house now is to stick as close to the Longworth compromise in the house as possible without accepting it as a whole. The same tactics were followed in the senate soldier bonus bill, the skids being all greased to adopt a senate bill with a large cash bonus, only to be abandoned when a genuine fear arose that President Coolidge would not only veto such a measure but make a great political gain by so doing. Likewise the Senate crawled before the House in the matter of the immigration bill and the willingness now to listen to the President for leeway to negotiate a Japanese exclusion treaty with the Japanese government instead of bringing about exclusion in the discourteous way proposed, is another reflex of the fear of the President which is growing.

On the other hand Congress is in desperate straits in other respects. The LaFollette group must force the passage of some kind of agricultural relief legislation, preferably the McNary-Haugen bill, or go back to their constituents and confess the impotency of a "balance of power" or third party group in Congress at the very time they want to increase their power.

LaFollette also wants to hold the railroad men in line by forcing action on the Barkley-Howell bill which abolishes the Railroad Labor Board and substitutes therefor a series of adjustment boards with a suggestion of arbitration, wholly eliminating the public interest from representation on the boards and giving no real authority to them either to prevent a strike or to handle one if one occurs. This legislation practically forces a "closed shop" on the railroads.

The democrats are just as much interested in getting the farmer and railroad vote in November as is LaFollette, hence the race between the democrats and progressives to demonstrate their friendliness even the face of a possible presidential veto.

The events of this month in Congress and at the White House will produce many issues which must be fought out in the coming campaign and legislation is now being shaped primarily with that end in view.

There will be no adjournment until the opposition to the administration has made all the capital it can out of the situation.

How your voice is turning a marsh into an industrial city

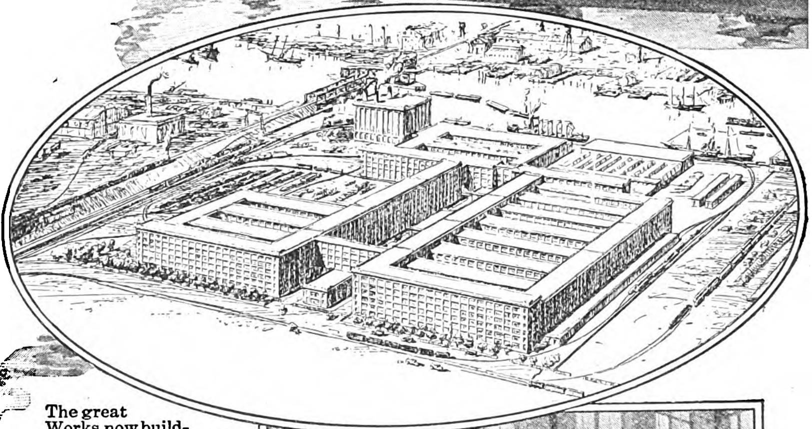
Giant pile-drivers hammering a whole forest deep into the Jersey marshes, five acres of which are being reclaimed.

YESTERDAY a marsh, today a center of building activity, tomorrow the second largest telephone factory in the world*— such is the change which Western Electric is bringing about in New Jersey's great industrial area between Newark and Jersey City.

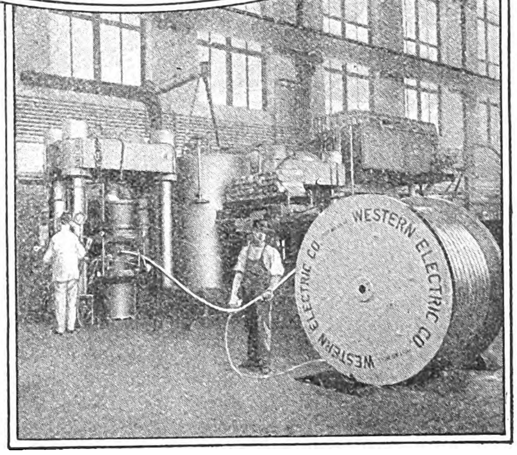
Springing into being at the call of your voice! So that you can talk near and far, your needs for more and more telephones and cable and equipment have given rise to this great expansion.

Since 1877 Western Electric has been alert to serve the requirements of the country for telephones. We will now be ready for even greater developments to come.

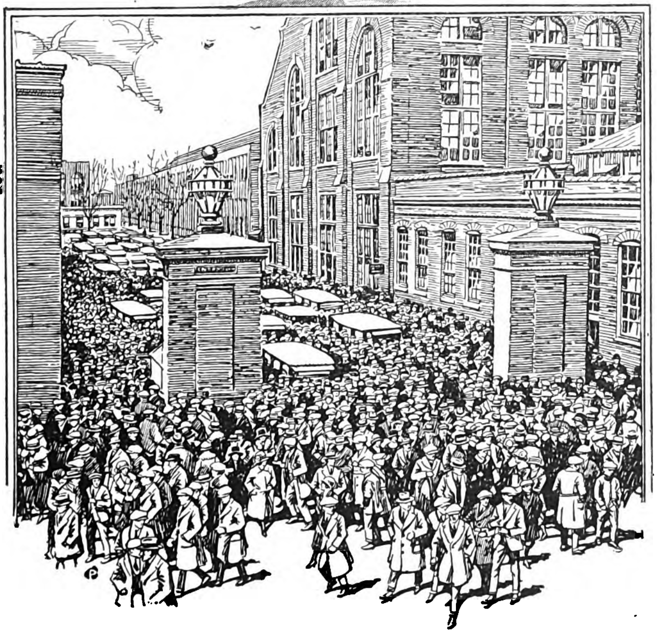
**The largest is the Western Electric Works in Chicago*



The great Works now building, as it will look when completed. A part of this plant is scheduled to be in production before the close of 1924.



10,000 miles of telephone cable a year! Such was the output of the Hawthorne Works in 1923. Our new shops will help produce a still greater mileage.



As building progresses, men and women by the thousands—in truth a cityful as at Hawthorne—will be busily employed here making telephone equipment.

Western Electric

SINCE 1869 MAKERS OF ELECTRICAL EQUIPMENT

Telephone Your Mother On Her Birthday

A LONG DISTANCE CALL to your mother on her birthday may mean more to her than the most elaborate gift. Mother loves to hear the cheery voices of her sons and daughters and to know that they have not forgotten her.

To have you with her on her birthday would be your mother's greatest joy, but if circumstances and distance forbid a visit, then call her by long distance telephone and let her hear your voice.

Standardization of Products Reduces Plant Shut Down at Inventory Time

WOULDN'T it be very much worth while if the amount of physical, clerical and other effort of inventory time could be cut in half, or probably even more; the period of plant shutdown greatly reduced; and all the figures available quickly without undue burden on the force? Have you thought of the possibilities along these lines afforded by the elimination of excess varieties of duplications which you may be producing and carrying in stock? But—increased facility of inventory taking is only one of the manifold benefits and savings that are certain to accrue from a simplification and standardization project, all of which point to that all important goal—the elimination of avoidable industrial waste.

Within the past year or two much has been said, written and accomplished regarding cooperative efforts in establishing simplified practice. In many instances this joint procedure is probably most effective and far-reaching, but let us consider the field of individual or intra-plant simplification and standardization, says the Chamber of Commerce of the United States.

Certain applications and possibilities become evident on first thought. For instance, such items as raw materials, purchased parts, component parts, finished product, cartons, packing cases, terminology, performance, brands and finishes are all amenable to the simplified practice treatment. Consider also the extent to which centralized effort is reflected in the functioning and operation of not alone the fabricating, but of the purchasing, the accounting, the engineering, the stock-keeping and all the other departments.

No suggestion or proposition is more effective than when substantiated by actual and practical demonstration. Here then, is the philosophy which has motivated one of the largest implement manufacturers—to quote:

"This company was formed by the uniting of several companies manufacturing similar lines. It was obvious that while the respective lines were to be preserved, elimination of needless varieties within these lines would be required and that selection should be made of those features of design which had been shown by experience to be mechanically and commercially sound."

The possibilities are not confined within narrow limits, as witness the diversity of a few commodity lines which have received treatment by individual manufacturers:

Bottles	210 to 20
Bread	15 to 6
Cameras	106 to 67
Cigars	150 to 6
Clocks	600 to 80
Fertilizers	100 to 17
Fine Papers	377 to 56
Forged Tools	2752 to 671
Men's Collars	150 to 25
Saws	660 to 203
Toilet Goods	425 to 140
Wheelbarrows	42 to 16

It should be observed, however, that such an undertaking is not single purpose. Its direct results ramify widely. The dealer benefits through the reduced number of lines with their repair and accessory parts which he must carry in stock; the ultimate consumer finds the ready interchangeability of parts on his several machines of immense value; and the supplier of raw materials experiences a substantial improvement in the facility with which his orders are processed and handled.

Then too, this carrying out of intra-plant simplification and standardization in no way precludes or hampers the cooperative movement within an entire idustry. In fact, it facilitates the broader project. The individual program may, in many instances be the proper initial procedure in that the potentialities of the work have been appreciated and the increased effectiveness of operation demonstrated. Interest ordinarily would be stimulated to the extent that subsequently all the manufacturers through joint efforts could determine upon a plan for the adoption of a simplified schedule to which the entire industry and trade would gladly subscribe.

Bethlehem Earnings Increase

Net earnings of the Bethlehem Steel Corporation for the first three months of 1924 were $10,549,149, as against $9,935,147 for the last three months of 1923. The regular quarterly dividend on preferred stock and 1¼ on the common stock, payable July 1 as of record June 2, has been declared.

SEEKS SIMPLER SPARK PLUG

That the present wide diversity in sizes and dimensions of automobile spark plugs is the cause of much waste in production and distribution of these commodities has been brought out by several spark-plug manufacturers, who have suggested the desirability of reduced variety to the division of simplified practice of the Department of Commerce.

Several manufacturers say one such plug could be adopted by all engineers. Adoption of the S. A. E. Standard ⅞" spark plug, with its eighteen threads per inch (U. S. Fine Thread Series), is recommended above all others. Some are of the opinion that this plug need be made in only three lengths, known as "regular," "medium extension," and "full extension," to serve all motor cars.

BOULEVARD

Before you plan a journey, ask the

Canadian Pacific *It Spans the World*

Here in this beautiful and convenient Chicago office of the Canadian Pacific and Soo Line you may feel assured of receiving accurate travel information and unfailing courtesy. No contemplated journey is too small for our attention, and none too large.

Where do you want to go? To Europe? To the Orient? Around the World? To the Mediterranean? To the West Indies and South America? To California and the Pacific Coast? To the Canadian Pacific Rockies? To Alaska? To Honolulu, New Zealand, Australia? To any Canadian city? To Old French Canada? To the Land of Evangeline and points in the East? On a Great Lakes cruise? To great fishing and hunting districts? To Wisconsin, Minnesota and the Dakotas? To the Twin Cities—St. Paul and Minneapolis; the Twin Ports—Superior and Duluth?

This is Chicago's newest travel headquarters. It is the Canadian Pacific in Chicago. It is Chicago's office of the World's Greatest Transportation System.

it. For the quality of its articles, the beauty of its illustrations, and its general appearance, it can stand comparison with any similar periodical, published anywhere.

The Bank of Italy, San Francisco, was founded twenty years ago by A. P. Giannini, in his early life an office boy. Its assets in 1894 were $285,436.27; on December 1924, $301,963,477.77. It ranks eighth among the 31,000 banks in the United States, has 75 branches in California and powerful affiliations here and abroad, forming the Bancitaly Corporation; it has 485,000 depositors, and 2000 employes. The East River National Bank of New York, A. H. Giannini, president, is one of those affiliations. The Italian-American Bank, also of San Francisco, is another large financial institution, and so are the Italian Discount and Trust Company, and the Italian Savings Bank, both of New York. There are many State Banks owned by Italians throughout the country.

A. Portfolio, of New York, is one of the largest manufacturers of cloaks and suits in the United States. The Gazzolo Drug and Chemical Company is a well known Chicago concern. The G. Corrado Coal and Coke Company, of Connellsville, Pa., are miners of coal and manufacturers of coke; they ship over a million tons of these products yearly. Gaetano Corrado, the president of the company, banker and capitalist, interested in many other enterprises. started life as a newsboy. Italians are well represented in the tobacco industry; the largest firms in it are the De Nobili Cigar Company, of Long Island City, N. Y.; the Petri Cigar Company, of San Francisco; the Canizzaro and the Parodi Cigar Companies, both of New York. The Petri firm has a capital of $500,000, and gives employment to 600 hands in a modern well appointed factory. with many provisions for the welfare of its employes. The Italian State Tobacco Regie recently opened a factory in New York for the manufacture of a popular brand of cigarette.

There are many large Italian firms in the canning industry. The Biscoglia Brothers, of San José, Cal., were ranchers, and began business a few years ago by making tomato paste with a truckload of raw tomatoes they had not been able to dispose of: now, the yearly sales of the Biscoglia Bros. Cannery Company run into millions. Marco J. Fontana, of San Francisco, was a pioneer of this industry; in 1898, when the Fruit Canners Association was established, he was made its superintendent; he is now president of the California Packing Company. He was six years old when his family came to this country; his father had been a laborer in the marble quarries of Carrara. Can the child of an Italian immigrant be useful to America? The Greco Canning Company, of San José, Cal., and San Sebastiano, of Sonoma, Cal., are among the many other large concerns in this line. Morici Bros., of Chicago, are part owners of one of the California canning establishments.

The fishing business is also conducted on a wide scale by Italians on the Pacific Coast. There are several thousand fishermen of that extraction at Black Diamond, Cal. The Paladini Company, of San Francisco, sends its ships and barges all over the Coast, and as far as Alaska. Many of the largest vineyards of California belong to Italians. The Italian Vineyard Company owns 3000 acres of land at Cucamonga, Cal., and the Italian-Swiss Association, 3800 at Asti, Cal. A. Sarboro, of the latter company, was in 1913 head of the Promotion Committee of California. A large number of Italian families were brought to Vineland, N. J., as early as 1878, chiefly through the efforts of a Philadelphia gentleman, not an Italian, whose name was Landis, for the cultivation of the vine.

The manufacture of alimentary pastes is, to a very large extent, in the hands of Italians, whose product has almost entirely substituted the imported; millions of capital, and thousands of men are engaged in this industry. The Chicago Macaroni Company is a consolidation of three prominent Chicago firms in this business. The Canepa Company, is another well known Chicago firm in the same.

Italians have done, and are doing their share in the building line; some of the most prominent building contractors in the country, as Antonio Campagna, and the Paterno Brothers, of New York, are of this birth, or descent.

Italians are not wanting in almost every branch of industry, and they are among the leaders in the artistic industries.

CONGRESS UNDER FIRE

Manufacturers' Committee in Washington to Fight Obstructionist Legislation

ADED by E. C. Heidrich, Jr., of the Peoria Cordage Com-
)any, president of the Illinois Manufacturers' Association,
mittee of sixteen prominent manufacturers and business men
Washington this week to bring forcibly to the attention of
ress its shortcomings in constructive legislation.

e principal subjects which the manufacturers' committee has
up with members of both houses are the Mellon Tax Bill,
Iowell-Barclay Bill, the Paige Bill, the "Eighteen-Year-Old
r" Bill and the McNary-Haugen Bill.

ose who comprise the committee are—

C. Heidrich;
P. Lamont, president of the American Steel Foundries (Chi-
); vice-president, Illinois Manufacturers' Association;
bert Sinclair, Mudge & Company (Chicago);
muel M. Hastings, president of the Dayton Scale Company;
man, federal taxation committee, Illinois Manufacturers' As-
ition;
L. Mansure, E. L. Mansure Company (Chicago);
H. Mulliken, Pettibone-Mulliken Company (Chicago);
J. Barklow, Gerlach-Barklow Company (Joliet);
tto F. Schultz, Western Felt Works (Chicago);
Gullicksen, Churchill Cabinet Company (Chicago);
C. Arthurs, Mount Vernon Car Manufacturing Company
Vernon, Ill.);
L. Ames, Booth Fisheries (New York);
R. Freer, Washington representative of the National Asso-
ion of Building Owners & Managers;
ol. Gordon Strong, Chicago representative of that association;
eorge A. Hughes, Edison-Electric Appliance Company (Chi-
o);
Van Meter Joyce, vice-president of the Watkins Company,
l—
ohn M. Glenn, secretary of the Illinois Manufacturers' Associ-
on and editor and publisher of MANUFACTURERS NEWS.

onferences on important aspects of pending legislation have
n held throughout the week, following a dinner last Sunday
ning in the Shoreham Hotel, Washington.

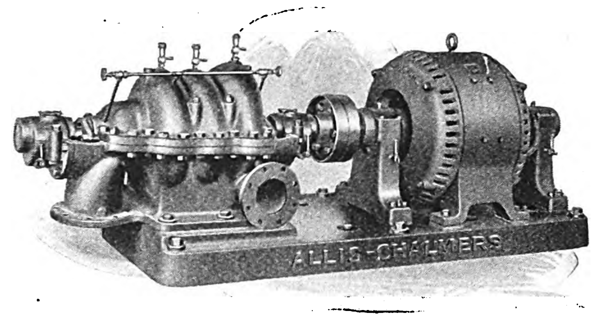
By far the most important subject undertaken was that of
Mellon Tax Plan. It is understood that the committee made
t one request of Congress in this respect—that taxation of busi-
ss be lowered just as far as possible.

It is pointed out that business as a whole, and, through it, the
tire people, is suffering by reason of existing too-high sur-taxes.
siness interests throughout the country complain, without ex-
ption, that high sur-taxes render financing difficult and serve
increase the problems of post-war readjustment.

One of the greatest complaints in this respect is that securities
e suffering, to the general disadvantage of investors everywhere.
ocks and bonds of unquestioned soundness are "going begging,"
nators and congressmen have been informed by the committee,
mply because the larger investors refuse to be "held up" and
re investing their surplus funds in tax-exempt securities.

The Howell-Barclay Bill, abolishing the railway labor board
nd substituting for it some forty-odd other tribunals, is regarded
s particularly dangerous to public welfare, affecting as it does
e vital points in the administration of the railroads. It means,
e committee fears, the "closed shop" for railway operation and
ractically, operation of the railroads by labor unions under
rotection of Congress.

While they do not desire to see the business interests of the
ountry harmed or hampered in any way, the members of the
nanufacturers' committee are nevertheless sensible of the fact
hat wages of parcel post employes (largely dependent upon rates)
hould, in many cases, be increased. The committee discussion of
he Paige Bill to increase parcel post rates, therefore, has taken
nore the form of investigation than of either favoritism or oppo-
ition.



SIMPLICITY

Contributes much to the good record made by Allis Chalmers Centrifugal Pumping Units.

For example a 3″ 5-stage pump in operation in a paper mill has only been packed once in two and one-half years. This pump is balanced by the Allis-Chalmers automatic hydraulic balancing device (which is very simple) and when this pump was opened for inspection the original tool marks still showed on the balance disc.

"The technique and mechanical side of the foreman's trai Dr. Kelly says in his report, "has already received attenti several educational institutions and private corporations, b fully satisfactory technique has been evolved for giving instru in the human engineering aspects of his task. *Training in t duties of the foreman must be given on a part-time basis, pre ably in the plant.*

"The work is of sufficient importance to rank with train employment managers and directors and instructors for indu trial education. It should receive state and federal support a ought to be made the subject of immediate research by colleg and technical institutions."

In an illuminating report the Federal Board for Vocati Education points to some strong reasons for this new interest foreman training.

"The present strong interest in foreman training as a means securing more effective industrial efficiency," the report sta "is due to two very active causes. The first is that owing to w emergencies during the past few years, the value of prop organized training and its definite results have been demonstra on a much larger scale than ever before.

"Secondly, many men concerned with the future of American industry feel that *to meet anticipated active foreign competition much more effective methods of production must be established* and that the weak links in the chain must be strengthened. Owin to these facts, many foreman-training courses are being undertaken or are contemplated in various parts of the country."

It would be interesting to know just what turn foreman training will take in the near future. It is hoped that more schools and organizations will cooperate with the factory plant to help train the factory foreman in modern management methods, an that foreman training will result in a higher type of shop execu tive, and in the elimination of the less desirable type—the foreman who refuses to assimilate in the modern production organization. It is hoped, too, that foreman training will aid the management to exercise greater care and judgment in the selection of its "key men."

There is no question that a higher type of foreman will do much to aid the management in its labor problems.

"A great deal of labor unrest results from corporations having failed to sell company policies through their own foremen," says Floyd W. Parsons, a writer on industry. "Too often, during periods of industrial strife, foremen are mere onlookers when they might have been efficient leaders and molders of thought."

What are the first results of foreman-training as already carried on in a number of industrial plants? The foreman begins to realize that mere "driving" of operatives does not increase production—that the worker has certain instincts and desires—that the worker is human—and that by appealing to these instincts and desires more can be accomplished than by resorting to browbeating tactics. He learns the delicate technique of dealing with men under stress and strain.

In a representative manufacturing plant a course of study for foremen was introduced. It consisted of a number of conferences, attended by the foremen and presided over by an efficient organizer. The groups met weekly. The foremen discussed various problems of importance. The course was supervised by a federal representative.

At the conclusion of the course this representative stated that more than 70 per cent of the problems in which the foremen were most interested were concerned with the handling of men.

Special training gives the foreman a broader outlook on the manufacturing process. He is no longer obsessed with the notion that speed in production in his department even at the expense of other factors, is the most desirable thing for the management. He comes to realize that what the management wants most is intelligent cooperation of the foreman with other factory executives. The foreman is trained for team work.

As a result of this training the foreman begins to think of the organization as a whole—of the importance of every little process in relation to the entire organization. He is encouraged to suggest improvements in methods and policies. In consequence, he lends a sympathetic ear to the suggestions offered by workmen

HE INVESTMENT BANKER

By C. W. SILLS

Vice President, Halsey, Stuart & Company

ighted 1924 by The American Bankers' Association of America

THE capital functions of the Commercial Banker have to do primarily with the collecting and loaning of his resources by means of which goods and services are exchanged in the every-day conduct of business, i. e., providing for the working capital requirements of ry.

comprehend this it is necessary to examine into the every-day ial operations of modern business. Most business is trans- on time. The manufacturer buys his raw materials on time ing to pay for them after they have been converted and ted as finished products; the same is true with the jobber etailer who buy stocks of goods on time, payment for which de after the goods are sold. Transactions such as these re credit to finance them. This practice of buying and g on time has been brought about by the growing separation tween the producer and the consumer due to the nationalizing internationalizing of our markets and the employment of -saving machinery. Thus it is that in the production and dis- tion of commodities, the interval between purchase and ent is directly proportional to the time consumed in this ess.

der our present credit structure, practically every business is both a debtor and creditor, liquidating his debts by means similar liquidation of credits due him from others. However, not common that the amounts due exactly correspond in t of time with the amounts owed, in which case it is necessary the business man to convert the credit instruments which he ls as a security for money due him, into means of payment er as cash or a credit balance which he can check against. practice is termed "discounting" or the lending of credit inst commercial paper and gives rise to the item "Loans and counts" appearing on a bank statement. The commercial k is literally a dealer in credit, financing the current needs he people as well as, to some extent, their smaller long-term ital requirements, the larger of which is the function which been assumed by the investment banker.

he investment house is the intermediary between governments, nicipalities or corporations desiring capital and the investing lic, looking for a safe place to invest its surplus funds. As h, it has come to hold a position of increasing importance in financial world.

Whereas in earlier days the local banker was ordinarily able finance the needs of his community, as well as supply local estors with attractive opportunities for placing their funds, larger demands now existing on the part of both the borrower l the lender have, in many instances, exceeded the local banker's ilities. The investment house is called upon in such cases. use. It supplies the community or corporation with the funds cessary for providing these services, safeguards and com- dities and takes in return their securities, secured by taxes the case of municipal issues, and liens on the properties of issuing companies in the case of corporations.

No less important a service is rendered by the investment use in providing investors with a safe and remunerative channel investment for their funds. The growing wealth of the coun- , the depletion in many communities of attractive local in- stments, together with the large municipal and corporate re- irements for improvements, extensions, etc., have all con- ibuted toward developing the investment house.

The investment banker operates in a dual capacity in advising th seeker and supplier of capital. His relationship with his rporate clients, particularly those who frequently come into the vestment markets, becomes very close and he is established as e company's recognized investment banker through whom all eir issues of securities are placed. The banker, to maintain is relationship, must hold himself in readiness at all times to

Selling the Man Your Salesman Never Sees

Big orders are often lost because the man your salesman sees can't resell the proposition to some man your salesman doesn't see.

In some household, some inner sanctum, some director's room, some banker's private office the decision goes against you without your ever having had a chance to present your case.

Into these blue pencil rooms where salesmen seldom penetrate advertising goes whenever you choose to send it.

Because of this it sometimes pays to use widespread advertising to influence a comparatively small number of people. Though 95 per cent of the readers of the publication may never be in the market for your product, the value of reaching the other 5 per cent may be so great as to justify the cost.

Insurance

175 W. Jackson Blvd., Insurance Exch.
CHICAGO

take care of the fixed capital requirements of his corporate c This requires substantial capital investment, coupled with s banking affiliations to enable him to underwrite, pay for carry until sold, the securities to be publicly placed.

His advice to his corporate clients must be sound and em feasibility, method, time and terms of the proposed fina He must have a highly specialized organization, including a c prehensive buying organization to analyze the financial st and requirements of the corporate client and work out a so financial plan and structure.

An efficient sales organization must be developed to ena him to distribute promptly his huge underwritings and also provide the needed capital at the minimum rate consistent w market conditions, besides establishing and maintaining a sat factory market for the issues. Prompt distribution is necessar to prevent congestion, which would cramp or eliminate his abili to serve his regular corporate clients. His failure to accurate judge the terms of an issue as well as market conditions may r sult in a heavy decline in price of the securities, which wou reflect unfavorably on the issuing corporation's credit and unde mine the confidence of his investing clientele.

While his obligation to the issuer of securities is importa his chief duty lies in furnishing the investing public with sound securities in which to place their surplus funds, so that these funds may safely be employed to the profit of the investor, in the proper advancement of our civic and industrial progress.

Probably no case in the history of the world is more illustrative of the importance of credit in securing capital than the situation developed by the enormous demands of the nations engaged in the World War. The bearing of credit on the fate of nations is brought most forcibly to light in the letters of the Honorable Walter H. Page, American Ambassador to England during the trying period prior to and immediately after our entrance into the conflict.

It was a well known fact that the submarines had been gradually though effectively destroying the means of transporting food and war supplies, which in itself was a serious menace to the Allied cause. British Officials not only admitted this serious situation, but immediately upon our entrance into the War, brought forcibly home to our Ambassador to be transmitted to the President of the United States, the equally serious credit situation confronting the Allied cause.

England's Allies had long since exhausted their credit facilities and England had loaned and used her own credit to an extent that was fast reaching a point which if the submarine did not succeed in shutting off food and war supplies, lack of credit would. Without the food and supplies furnished by the United States, the Allies could not have continued the War.

England, as admitted by her own officials, had overdrawn her credit through her American bankers to the extent of several hundred millions. How much further she could have gone before her ability to buy in the United States would have been shut off is problematical. The gravity of it, however, is emphasized by the fact that the two most important actions urged and insisted upon by British officials immediately upon the entrance of the United States into the War were the aid of our Navy to break the submarine blockade and to relieve the British credit strain.

The United States did both, a very substantial proportion of the First Liberty Loan of $2,000,000,000 being immediately diverted to clearing England's credit obligations, making possible continued purchases in this country. Subsequent loans ran into billions. This marked the turning point in the War. The prompt throwing of America's resources and credit into the balance, plus our immediate naval aid, reduced the situation to a question not of whether the Allies would win the War, but merely a question of when.

MEMBERS OF THE ILLINOIS MANUFACTURERS' ASSOCIATION have subscribed to over $750,000 of the debenture bonds issued by the Agricultural Securities Corporation for the relief of the bankers and farmers of the northwest. The full quota of the United States was $10,000,000.

OVERHEAD

By JOHN C. NAYLOR

Comptroller, Pet Milk Company (St. Louis)

Continued from Last Week

OTE: In last week's MANUFACTURERS NEWS, Mr. Nay-
fter explaining several other systems of accounting overhead,
ɪp a theory recognizing the fact that outside business condi-
have a vital bearing on the running hours of machinery and
ment, and attempting to remove this charge from the oper-
cost and place it in the administration or general section
profit and loss account. Under this plan, overhead accounts
harged with the actual overhead expenses and credited with
mount of overhead distributed to the product on the basis of
ormal overhead rate.—EDITOR.)

WHILE this theory gives recognition to the fact that
outside business conditions do have a vital bearing
on the number of operating hours, there are certain
serious objections.

In the first place, there is, of course, always the
ulty of determining standard production. In the next place,
ortional distribution is not necessarily true.

ıe expenses around any plant may be divided into two main
ses,—fixed expenses and variable expenses. Fixed expenses
those expenses which occur regardless of whether the plant
perating full capacity, and can never become zero. In other
ds, such items as rent, insurance, depreciation, etc., continue,
ırdless of how small an amount of work is done in the plant.
iable expenses, on the other hand, are those expenses which
tuate almost in proportion to the activity of the plant. For
ance, when the activities of a plant are reduced, the amount
ower used to run the machinery, and the amount of oil neces-
for lubrication, etc., are decreased.

his theory, therefore, is strictly logical only when some lines
completely suspended, and the remaining lines continue to
normal, or when there is a moderate decrease in all lines.
s not applicable, however, if great decreases occur in all lines,
there is an irreducible minimum below which the fixed ex-
ıses cannot go. It would be manifestly incorrect to contend that
shop should be charged with only one-fourth of the overhead
case the production should be decreased to one-fourth the
mal production.

Rather extensive investigations regarding fixed expenses have
n made by Nicholas Thiel Ficker, the results of which are
wn in his book "Shop Expense Analysis and Control." These
estigation show that the fixed expenses in a large number of
ınts averaged about 40 per cent of the total expenses. *Under*
se conditions it is very apparent that, as production decreases,
effect which fixed expenses have on the production cost is
ry much increased.

Mr. Ficker has therefore advanced a theory, which resembles
general principle the theory advanced by Mr. Scovell, Mr.
ıntt and others, but differs in degree. This theory is that the
pense chargeable to the product should be that portion of the
nstant expense which the current activity is of the normal activ-
, plus the actual current variable expense.

Assuming the same illustration as given before, with the addi-
ınal information that the actual overhead for the period is
,500, being made up of fixed expenses amounting to $1,400,
ıd variable expenses amounting to $2,100, the amount charge-
le to cost would be determined as follows:

Fifty per cent of the fixed expenses, that is, 50 per cent of
,400, would be $700. This, added to the variable expenses
nounting to $2,100, would give $2,800, or the amount charge-
le to current cost. The remaining expense, amounting to $700,
ould either be carried to a reserve and distributed in good years,
r charged to the profit and loss account as an idle plant expense.

The outstanding difficulty in connection with the application of
ither Mr. Ficker's or Mr. Scovell's method is the determination of
ıe exact amount which should be charged to current cost, and

the amount which should be carried as an administration item.

While these methods would seem reasonable in theory, there are certain dangers in using either of them, that should be given consideration.

They assume that all expenses due to idle machines are irrecoverable, but this is not always true. Mention has previously been made of the fact that the supplementary rate serves as a barometer of factory efficiency, focusing attention on idle machines and equipment cost. In the absence of outside influences there is a certain amount of idle expense which may be chargeable to shop management, and the supplementary rate has served a useful purpose in reducing the amount of this inefficiency, although outside influences have often had such an effect upon the costs compiled under this method as to obscure the real cost.

Another danger in connection with the use of these methods is a frequent misunderstanding as to certain special machines which are never expected to operate at full capacity. For example, in an armor-making plant some machines are not expected to operate at full capacity for the entire year. Another instance is found in the case of large machines in boiler shops, which are used only in the construction of exceptionally large boilers. It is, of course, very apparent that when it is anticipated that machines similar to these will be used only a small part of the year. of the total expenses incurred over the relatively small amount their efficiency and economy must be evident after the distribution of product made.

It is also valuable, in certain cases, to know what proportion of the factory cost is represented in a particular cost figure. In order to overcome this difficulty some cost accountants recommend showing the normal factory cost in the usual way, and then adding as an unusual item of cost the expense ordinarily charged off to profit and loss, or carried in a reserve account.

Another abuse of these methods sometimes results in the showing of a profit for different departments in periods of great depression. While at first sight this might appear to be a mockery to cost accounting, yet if the statement of undistributed expense for the same departments is available and can be examined in connection with the current cost statements, no great harm should be done.

There is always the danger that the operating department may think its responsibility is reduced when the unusual expenditures are charged to profit and loss, instead of to current costs. If caution, however, is used in determining the amount of expense that should be charged to the profit and loss account, and in seeing that if any error is made at all it is made on the side of charging the doubtful items to current costs, it would not seem that the operating department will be unduly relieved of any of its responsibility. As a matter of fact, at the present time the operating department is frequently the Good Samaritan who stands the brunt of all outside influences.

While no new principle is involved, mention should be made of the various overhead reserves methods that are mentioned in current magazines and publications from time to time. As previously mentioned, in practically all the modern theories the burden accounts are charged with the actual overhead expenses for the period. They are credited with the amount of overhead charged to the current costs. When production is above normal, the credit balance in this account will be increased, whereas when the production is below normal the credit balance in this account will be decreased, or even changed to a debit balance.

The name of the account used to record the overhead data is unimportant. It may be known as "overhead reserve," "burden account," "over-absorbed burden," "under-absorbed burden," etc. It is the principle that must be firmly fixed in one's mind. The theory of the overhead reserve account is found in all the modern methods, and is analogous to the accounts receivable reserve, with which everyone is familiar.

Much has been written about the adoption of these modern methods, rather inferring that such methods mean the abandonment or compromising of actual overhead cost. While from a mathematical standpoint this may appear to be true, from the standpoint of common sense it will readily be admitted that no other action is possible.

Cost systems should be built for service, not admiration, and

PROMINENT CHICAGOANS DEAD

H. M. Byllesby, F. C. Letts and C. F. Wiehe All Well Known, Die Suddenly

ATH claimed three prominent Chi- :agoans this week.

art disease, with which he had been ed for years, on May 1, caused the of H. M. Byllesby, head of the La street bond and engineering house, nally known promoter of public ies and one time co-experimenter in icity with Thomas A. Edison.

. Byllesby was stricken in the offices . William G. H. Logan, a dentist, at 29 Madison street. With him at the time a nurse, Miss Mary W. Kindigh, who, Dr. Logan, placed him on a couch he said he felt weak, and called a t specialist. When the specialist ar- l Mr. Byllesby was dead.

ristian F. Wiehe, prominent in Re- ican political circles and former sec- y and treasurer of the Edward Hines ber company, died in his summer home ron River, Wis., late Wednesday night.

r. Wiehe suffered a stroke of paralysis December and has been under the con- t care of a physician since. He was re- ed to Wisconsin two months ago under the advice of the doctor.

He was former president of the west park board and more recently head of the bond department of the state's attorney's office under Mr. Crowe. He was relieved of his active duties at the time of his illness and the work has since been in the hands of John P. Lenehan, a well known politician.

Frank C. Letts, director of supplies for the Red Cross during the war, owner and director of large wholesale grocery interests, died Saturday morning in St. Luke's hospital, Chicago. He succumbed to arteriosclerosis and had only recently returned from Europe, where he went for his health.

Mr. Letts was 63 years old.

Owner of fourteen wholesale groceries in Iowa, Minnesota, and Missouri, fifteen in Michigan, Indiana, and Illinois, besides his local concern, Mr. Letts' career was a romance of business. He was a director of the Durnad-McNeir-Horner company of Chicago, and owned in addition to his grocery interests, a number of vegetable canning plants and three coffee roasting establishments.

Continued from Page 7

reserve this to the last because it is so ous that it must be dealt with sepa- ly. If one could but have presence mind to drop to the floor and roll, or l a rug over them. But alas! for one will do that; ninety-nine will run, ning the flames and, in screaming, llowing the fiery vapors.

f a woman is the rescuer, *she must think herself,* else there will be two victims tead of one. It is this point which is gotten by the mother in the case of a le child—hence, "the 82 per cent of ths among mothers and little children ler school age."

A wool blanket, rug or any heavy gar- nt should be used for protection and o as a means of extinguishing the flames. e victim must be thrown to the ground, ned on the unburned parts and the fire aten out, then removed from the draught the open air, or hallway, into a room th windows and doors closed. Call for ur, scissors and aromatic spirits of am- nia; as soon as these are procured, pecially the first two, proceed as llows:

Begin to remove burnt clothing (but be reful to cut around parts which stick) d rub in oil, lard, etc. As the parts are covered, smother liberally with dry flour. rn starch would be even better! If the ce is burnt, remember the point about a ask for that part, and cut a second one to otect the first.

Over the flour-smothered body place a eet up to the chin and over all a good arm blanket. Then treat shock by giving peated sips of aromatic spirits of am- onia, in hot water, one-half teaspoon to e-half cup of water.

Permit me to explain this form of first-aid treatment, especially in reference to the use of flour or corn starch.

You will recall that I stressed the point that the reason for the high death rate from such extreme burns was due to shock, because the rendering of first aid or medical assistance was usually delayed. So then, every moment is telling upon the victim. It is almost impossible to procure cloths in sufficient quantity, or oils, or baking soda solution at once, and even if those are to be had, too much time is taken by preparations. But with flour or corn starch it is but the work of a moment to apply. Thus the air is quickly excluded and shock from exposure minimized. With the help of that wonderful stimulant, aromatic spirits of ammonia, there is a good chance of saving life, because this expeditious treatment means much to the medical treatment to follow.

Automatic Phones Ordered

It has been announced that the principle of conversion to automatic working of the whole Durban (Australia) telephone system, in sections of 2,000 telephones a year, over a period of four years, has been approved by the Durban Town Council. The cost is estimated at £40,000 per annum. Durban is the only town in the Union in which the telephone system is owned and operated by the municipality.

Peters Machinery Company Moves

The Peters Machinery Company has moved into its new plant at 4700 W. Ravenswood av., Chicago, according to an announcement received by MANUFACTURERS NEWS recently. The new building is about a block in length.

To Better and Increased Business

Letters of high character are more productive and cost no more.

Forty years of experience and service have equipped our organization to produce effective result-getting literature and direct mail campaigns.

We are fully equipped to do any kind of printing or letter work.

Our mailing lists are up to date, which insures maximum results.

We will fold and mail, relieving you of all the details at less cost than if done in your organization.

Creating business where your market is can only be done by careful analysis, effective sales copy and proper presentation.

Our Staff and Craftsmen will gladly serve you.

Chicago Addressing Co.

Why not a profit— instead of a loss on your rags?

Forty-nine tons of rags saved in a single year was the record made by one big printing plant with its Troy Rags and Waste Reclaiming System.

How many *Tons* of rags ($) a year are you burning each year?

Our equipment will enable you to *re-use your rags* many times—thereby showing you a *profit* where a loss now exists.

Are you burning your rags, simply because they are grimy, dirty, or oil soaked, when we can show you a far better and more profitable disposition of them by our Reclaiming System?

FOREIGN TRADE

Current Requests from European Buyers

Fifty thousand tons of saltpeter are requested this week by a manufacturer in Danzig, whose needs are listed in the offices of MANUFACTURERS NEWS.

Other good orders open to American manufacturers include 1,000 square yards burlap for covering walls, 5,000 kilos of oil for electric transformers, complete equipment for a peanut butter factory, motion picture apparatus and sugar.

Confidential information concerning any of the week's opportunities in foreign markets may be obtained by any manufacturer who will write to MANUFACTURERS NEWS stating the serial number of the item concerning which information is desired.

Requests from abroad received this week are—

AUSTRIA—
10050: Saltpeter. Turpentine.
10028: Office supply novelties.
BRAZIL—
10065: Printing and binding equipment, modern.
10048: Vulcanizing machines with table; capacity for handling three tires at one time.
CANADA—
10080: Hosiery.
10035: Lawnmowers, power.
CHILE—
10082: Cotton piece-goods, particularly grey sheetings and drills. Flannels.
COLOMBIA—
10043: Galvanized iron articles for domestic use.
10029: Motion picture apparatus.
CZECHOSLOVAKIA—
10063: Carbon paper.
DANZIG—
10055: Saltpeter, 50,000 tons.
EGYPT—
10083: Burlap, 1,000 square yards, for covering walls.
ENGLAND—
10023: Carbon paper. Colored leads and inks. Office supplies including filing systems.
10066: Carbon paper.
GERMANY—
10057: Alligator skins, raw, salted.
10078: Corsets, maternity, medium-priced.
10071: Flour and grain, best quality.
10073: Lard. Corned beef. Skins.
10072: Lard. Tallow.
10049: Paraffine, table. Rosin. Sulphur, block. Turpentine.
10081: Rags, woolen and half woolen.
IRELAND—
10038: Radio apparatus and parts.
JAVA—
10040: Asbestos cement sheets and piping.
10062: Newspapers, old.
MANCHURIA—
10032: Ozonizers.
NETHERLANDS—
10031: Buttons. Belts, leather, waist. Cigar lighters. Garters. Hosiery. Kitchenware enamelled. Knives, pocket. Laces. Leather cloth. Pyrophoric metal. Paper. Petrolatum pomade. Prayer rugs. Singlets. Stationery. Typewriter ribbons. Wire netting.
POLAND—
10025: Knitting machines, hand.
PORTUGAL—
10064. Sugar.
SCOTLAND—
10037: Caffit picks (hoes).
10053: Sulphur, crude, for explosives.
SOUTH AFRICA—
10026: Glass containers for peanut butter. Machines for vacuum sealing of glass containers. Machines for blanching peanuts
SPAIN—
10041: Brass tubes for locomotives. Copper and iron sheets.
SWEDEN—
10074: Egg products, yolks and albumen, best quality.
10077: Tubing, rubber, with flexible metal core
SWITZERLAND—
10037: Caffir picks (hoes).
TURKEY—
10075: Galoshes.
URUGUAY—
10022: Oil for electric transformers, 5,000 kilos.
WALES—
10039: Garnet ore, crude and graded.

Leather Bids Sought

Leather manufacturers and dealers are bidding on stated requirements of the Government Indian Service, which requires leather, show findings, saddlery, etc., under Class 11, fiscal year 1925. Bids are to be opened May 23 at St. Louis, Md. Bids for hardware, plumbers' supplies, etc., for the Indian Service will be opened at St. Louis May 29; proposals for medical supplies, May 19; for laundry equipment, furniture, etc., May 27.

Veterans' Bureau Asks Bids

Sealed proposals are being received by the United States Veterans' Bureau, Washington, D. C., and will be opened May 21, for water softening plant, including water storage tank, changes in the present distribution piping and heating and lighting of the boiler house addition at veterans' hospital No. 97, Chillicothe, O. A deposit of $10 is required.

Steel Wanted in Hankow

There is a fair market in the Hankow consular district for imported steel products and metals of all kinds, although steel is made locally, at the Hanyehping works. The demand, therefore may be expected to increase along with the industrial development of the region. The chief consumers of iron and steel are the railways, although orders for railway materials are generally placed with the Ministry of Communications at Peking.

Certain quantities of iron and steel are required from time to time for modern office buildings and residences constructed in Hankow as well as for the modern industries springing up in the various centers throughout the district. Structural steel is a large item of import, comprising wire mesh and expanded metal reinforcement.

There is a steady demand for galvanized sheets with an extra heavy coating to resist rust.

Continued from Page 22

›st system fails the manufacturer when it is most sorely , and prevents him from obtaining new business when an ed production is the only possible solution to his diffi- iis cost system is worthless.

actual expenses will still be ascertained, and can be com- not only with the actual expenses of any other period may be chosen, but also with the estimated or standard cost ined for the period in question.

nswer to the charge that by using these methods there may ilure to include some overhead expenses in the cost of the ›t and therefore in the selling price, let it be said that under ›dern methods the cost system will be more likely to show ınufacturer how to recoup his losses than under the method tributing the entire overhead expenses regardless of the ıt of product made. Management should not only bear the se of subnormal production, but should be rewarded for mal production, because it is only in the good years, when ction is above normal, that the manufacturer can hope to in his selling price the amount necessary to recoup his in lean years.

much for these different methods, their merits and their . By way of summary, the following important points d be considered in the distribution of overhead, particularly ıormal times:

.. Consider only the production expenses.
2. Charge direct to the job or process wherever possible, thus reducing the amount which must be charged to the overhead account and distributed arbitrarily.
3. Segregate expenses by departments.
4. Analyze your expenses by means of a complete "Card of Accounts," in order that you may determine how much has been spent for each classification.
5. Establish a standard rate of overhead based on a period long enough to take in all variations of expense, season, depression and prosperity.
6. Insofar as possible, distribute overhead expenses to jobs in proportion that they have made use of the manufacturing facilities. In other words, make a distinction between a file and a large boring machine.
7. Establish the necessary accounts, whether they be called burden accounts, reserve accounts, or by some other name, to control this over-and-under-absorbed burden.
8. Combine theory and common sense.

ıdging from the slowness with which other matters of over- l distribution have been adopted generally by manufacturers, ribution of overhead in abnormal times will also experience safe to assume that modern theories in connection with the ther slow introduction, but there is no doubt that these methods e passed the theoretical stage, and are here to stay.

Continued from Page 18

ıis department. The management, in the long run, benefits.

'oreman training is a sort of insurance for the future. Ex- ience has shown that when factory foremen are trained in ir duties and are prepared for any emergency, sudden ex- ısion in production can be taken care of as a matter of course. foreman will readily assimilate in the new organization.

lthough, in the highly organized plant, the instruction of rkmen is not the concern of the foremen, yet in daily contact h workmen he actually exercises the functions of the job tructor. This is especially true in smaller plants where fore- n are expected to break in new men, and instruct old hands in ter methods. Foreman training makes a better, and more npathetic teacher out of the foreman—it gives him a better derstanding of the teaching processes and the mental capacities the workmen under his charge.

All these things are important to the plant management. In long run these factors determine the quality of the product. ›dern industry demands a fine, standardized product, produced minimum possible cost. But the danger is cheap production, the expense of quality. The management must take care of ›s. It is the foreman's job, above all.

J. J. O'BRIEN HEAD BYLLESBY & CO.

Arthur S. Huey Elected Chairman Board; Both Long Associated with Firm

H. M. Byllesby & Co., Standard Gas Electric Co., and Northern States Power Co. elected new officials Tuesday to vacancies created by the death of H. Byllesby. Directors elected Arthur Huey, chairman of the board; John O'Brien president and Robert J. Graf. vice-president. These men will direct the public utility companies scattered throughout the United States under management of H. M. Byllesby & Co.

These three men have been associated with Col. Byllesby in the founding and upbuilding of the Byllesby organization and with him composed the executive committee in which full administrative and executive authority has been lodged since the practical retirement of Colonel Byllesby from active duties, due to ill health last October.

Henry C. Cummins was elected a vice-president of H. M. Byllesby & Company and Albert S. Cummins was elected a vice-president of Standard Gas and Electric Company and Northern States Power Company.

Rubber Exports Gain

The total value of exports of rubber goods from the United States in 1923 was $36,972,170, a gain of $2,962,862 over the 1922 value. This result is the more remarkable because of the lower 1923 unit values in practically every line of products, says the Rubber Division of the Department of Commerce. Exports of tires and tire sundries decreased in value from $20,702,98 in 1922 to $20,320,753 in 1923, in spite of heavier unit shipments of each of the seven classes of products reported in the group. There was however, a decided and striking increase in the exports of solid tires for automobiles.

Sloan Tells of Market Conditions

Alfred P. Sloan, Jr., President, General Motors Corporation, recently made the following statement regarding conditions in the industry:

"Movement of General Motors cars to its dealers during the first quarter will exceed in number the corresponding period last year, by 20 per cent. Movement from dealers and branches to actual customers, although hard to measure exactly, is at least equal to, and undoubtedly somewhat in excess of, the corresponding period last year. Stock of cars in General Motors hands to day equals about 10 days' current production. Cars in dealers' hands are in excess of corresponding time last year—a condition sought in view of the experience suffered last year of being unable to effect prompt deliveries—hence, loss of busines

AILROAD NOTES

ırge Line Smashes Rail Rates

n-day service from Chicago to New s at rates approximately 20 per cent all-rail rates, is announced by H. E. nan, general agent for the Federal Line. Weekly express boats, leaving uis every Friday, are being operated anection with the Illinois Central ge car service.

M. nks succeeds Mr. Needles as vice-presi- in charge of operations. B. W. Herr- becomes vice-president in charge of ic; J. M. Crawford, general manager, J. M. Rodgers, general manager.

Railroad Earnings Increase

uarterly reports of earnings, made lic this week by three railroads, all wed increases in net operating income. Pere Marquette's net operating income the three months ending March 31, 4, was $1,542,945, as against $1,379,- last year. That of the Delaware, Lack- ınna Western was $3,219,000 as against 247,875 last year, and that of the Wis- sin Central was $546,045, as against 3's $502,145.

Benefits Paid by Pennsylvania

Benefits totaling $4,215,689, were paid employes of the Pennsylvania Railroad l members of their families, through the ıployes Voluntary Relief Fund, in 1923. ese payments included $2,714,540 in ıefits to employes who were unable to rform their regular work on account of kness or other disability, and $1,501,- 9 in death benefits to the families of em- oyes who died during the year. In ad- ion, superannuation allowances amount- g to $488,285 were paid to retired em- oyes who had been members of the Re- f Fund during the period of their active rvice.

Illinois Manufacturers Mutual Casualty Association

(INCORPORATED)

A Service Department of the Illinois Manufacturers Association

The Illinois Manufacturers Mutual Casualty Association, Inc., has been organized by Manufacturers of the State of Illinois to furnish to the employers of the State efficient service in the solving of plant accident problems.

The Association through co-operation can effect a large saving on Compensation Insurance premiums each year and in addition furnish superior service to its policy-holders.

Full information and rates will be furnished prior to the expiration date of your present policy.

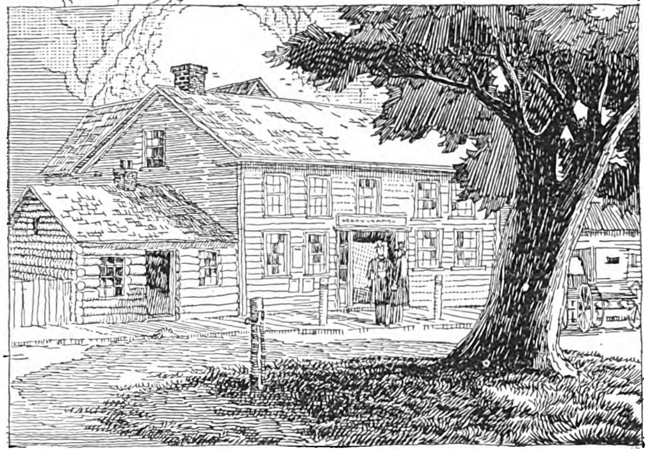
Victory Bridge, Danville, Illinois —a memorial to those who served in the Great War



Law Office of Abraham Lincoln at Danville, Illinois, 1855

ABRAHAM LINCOLN—outstanding figure of the century—adamant in defeat, magnanimous in victory! Powerful as his influence was in life, it is greater still in death. Today, as never before, every section of the country unites to honor his name.

If the Great Emancipator were here now, how he would glory in this splendid memorial which stands in the country he knew and loved so well and which serves as a connecting link between his age and the present!

We're proud of the part we've played in building the Victory Bridge. For all time to come it will stand to commemorate the valor of those who gave their all in order that Democracy might live.

"NONE SO BLIND—"

IN its refusal to accept the Mellon Tax plan, Congress has disregarded the wishes of its constituency. The people wanted the Mellon plan. Public sentiment favored reduction of taxes as provided in the Mellon plan, especially reduction of surtaxes on major incomes. Every thinking citizen chafes in the knowledge that high surtaxes bar capital from industrial enterprise and hamper industrial progress.

SUBSTITUTION of something "just as good" is not acceptable to the majority of the public. In its attempt to smooth over the revision, Congress itself confesses its knowledge that its action has not met with popular approval.

THE people know that their own welfare depends upon the progress of the country's industries. And they know that high surtaxes mean that investment in tax-exempt securities will be continued by the country's big capitalists, and that *that* means that the money that spells continued employment at good wages is being diverted from industry.

IN cramming tax revision legislation down the people's throat, Congress is playing the role of a temperamental and egotistical prima donna. It ignores the welfare of the citizen and of the nation. The substitute will not obtain sufficient revenue for the necessities of Government. Industry, the people's means of livelihood, will suffer.

THERE is none so blind as he who will not see.

THE INDUSTRIAL ENGINEER

The Engineer's Relation to Management *

By HUGO DIEMER

Director, Industrial Management Division, LaSalle Extension University.

Advance Copy of a Chapter from the new edition of Col. Diemer's tory Organization and Administration," published by McGraw-)

---

1. Modern Industry Demands Broad Knowledge and Wide Vision.

UP to a comparatively recent period business managers and engineers adhered to a philosophy which contented itself with confining the thought as well as internal activities of the production organization to operative technique.

he actual production in the factory was left to the rule-of- nb ability, based on experience, of superintendents and works agers of the go-getter type—usually men with little general cation and without knowledge of the broader problems of iness administration. In "A Study of Engineering Education" C. R. Mann, the statement is made that less than five per cent he production managers of the country are college trained. be sure, the graduate of the engineering schools was accorded e recognition by giving him a place in the designing or test- department. His line of promotion, however, was circum- bed by a well-defined barrier surrounding the so-called engi- ring department.

his barrier is well recognized by the President of a well-known aufacturing company, who designates the average college- ined engineering graduate as one "who will take his place ong those students of the clerical type that are the hand-books industry, much thumbed and used, and who frequently show ns of wear and tear and dilapidation, referred to for a state- nt of facts or formulation of law; but in emergencies of every- life, frequently passed by in the race for accomplishment. The yclopedic type is sufficiently common to meet the need."

n the earlier days of industry the term "engineering" included signing, production and marketing. And this is still true where petitive manufacture is not a predominant feature.

A report on Production Engineering made to the Society for omotion of Engineering Education, says, "So definitely has oduction drifted away from the engineering curriculum that newly graduated engineer considers he is losing caste to go o crude production. He fears to be deprived of scope for his hly technical training. Some graduates change their view- int a few years later, but in the meantime valuable time is lost. e development of quantity production is materially retarded ause of this side-tracking of men to the more technical fields design, who, because of their higher training could give an petus to its progress which is difficult to estimate."

Some concerns have given the engineering college graduate a ance to work a year or two in the operative departments with view of giving him a place later on as a salesman on the road in a district sales office.

But even today production is very largely directed and carried t by men without adequate breadth of basic education and ining.

The definite technique of production control, organization and system, including such work as planning, scheduling, dispatching, inspecting and cost accounting, has been well developed. It must be recognized that a training and vision confined to a knowledge of production engineering, production control and cost accounting is entirely too narrow for a man who expects to rise to a position of leadership in industry today. In fact, it is too narrow even for a man who expects to function satisfactorily as an individual member of the production force. Not only the foreman but even the stock clerk, time-study man or cost clerk needs a broader outlook.

The reasons for this are well stated by Dr. H. S. Person, Managing Director of the Taylor Society, in analyzing the new industrial and marketing conditions which confront us today. "These conditions," says Dr. Person, "involve the necessity for continous attention to future policies and long-run planning."

Activities in the remotest corner of the shop may be affected by considerations which involve a knowledge of these conditions by the individual directing these minor activities. Among these conditions are:

Variable demands of the market.
Variable strength of competition.
Financial and technical resources.
Competence and contentment of workers.
Government restrictions and regulations.
Changes in habit and attitude of consumer.
New discoveries and inventions.
Changes in social machinery.

2. Why Men Holding Minor Positions Must Think Beyond Their Jobs.

Men holding minor positions in the line or staff in industry need this broader training—not because we expect them to become, through a course of reading, ready for quick promotion to the job of general manager—but because the principles of management, practically applied, will lead them to make correct solutions of many problems which arise every day in the conduct of their own work. It would be presumptuous to assume that merely reading and thinking about the broader aspects of industry and the special methods of factory organization and administration, can ever take the place of actual operative experience and maturity. But there is no surer stimulus and no surer remedy for the so-called social unrest in industry than education and training along general and specific industrial lines.

3. Why Men at the Top Need the Broader Outlook Furnished Through Study

There are, and will always continue to be, many men in the higher offices and positions in industry who hold these positions as a result of family interests, inherited wealth or friendship. There are also, at the present time, many young executives who hold their present high positions due to the shortage of executives during the period of tremendous industrial expansion of the last decade. It is important that the men of this type become students of management science, of right human relations and of the technique of production organization and control. Such knowledge is necessary for them in order that they may be able to distinguish between real merit and pretense; between symbols and realities; between self-styled industrial and management engineers with no engineering training or experience, and real engineers; between what policies, methods and systems are applicable and analogous to their particular business and those which do not apply.

4. The Fields of Study Containing Principles and Data Underlying Factory Organization and Administration.

The engineer can serve those engaged in production in the most effective way by getting a mastery of the facts which govern successful production.

What are these facts and where are they to be found?

The operation of factories is designated by economists as one of the secondary industries, primary industries being those which have to do with mining, lumbering, fishing and other undertakings which are of the so-called extractive variety dealing with nature's products.

The engineer who directs production should draw from each of these fields such material as is essential to the man who is going into manufacturing more efficient, more successful and more satisfactory to the worker, consumer and investor. Let us glance for a moment at the accepted definitions and the scope of study of each of the related fields.

5. Economics.

Economics has been defined as the science of wealth. A knowledge of economics is one of the scientific fundamentals, not only of the factory and of industry, but of all business. Economics deals with the production, distribution and consumption of wealth. A study of economics is a pre-requisite or accompaniment to any course in business administration, and is equally important to the student of factory administration.

6. Business Administration.

A well-rounded study of business administration includes a study of business finance, credits and collections, budgeting, accounting and auditing, statistics, marketing, including creation of demand and agencies for distribution. It deals also, in a general way, with the operation of stores, offices, financial institutions and factories, and the human relations involved in these operations. It should be appreciated and understood that a course in business administration must, of necessity, be comprehensive and must adopt the economic viewpoint in discussing the administration of production. There is usually not room in such a course for training in the preliminary basic and applied sciences involved in operative methods. A combination of a course in business administration with a standardized course in engineering, while giving a student a broader outlook on industrial life as well as the technique of designing and testing, is still lacking in the specific training required by the production executive in that it does not include a study of production engineering and production control, nor even the principles of industrial engineering.

7. Production Engineering.

Production engineering is properly a sub-division of the more general field of industrial engineering. The discussion of this topic is here introduced for the specific purpose of showing the contrast between its activities as well as the type of mind required to conduct these activities, and those involved in business administration. Production engineering deals with all of these engineering problems which have to do with the lay-out of fabricating processes, the decision on special aids and devices called for in these processes, including special fabricating equipment, jigs, fixtures and gauges. It involves a knowledge of the scope and limits of standard equipment used in the general run of factory operations as applied to a specific undertaking.

It is the business of the Production Engineer to know every single item and component that constitutes his finished product and every step involved in the handling of every component. He must know what is the most advantageous manufacturing quantity of every item so as to secure uniformity of flow as well as economy of manufacture. He must know how long each step should take under the best working conditions.

Production engineering is effectively taught in engineering shops, laboratories such as those of the University of Michigan, the University of Illinois, and the Pennsylvania State College. Production engineering can be and has been carried on quite independently of and aside from any effort to introduce organized production or industrial engineering.

8. Production Control.

In order to control production, there must be definite plans covering purchase and use of materials and supplies, a list of the operations to be done and assignment of these operations with proper tools and equipment to certain departments. There must be established production programs and schedules covering financial expenditures, flow of materials, additions to and shiftings in the working force, and a check up on schedule as well as on actual costs as compared with predetermined costs. Production control is an essential and outstanding feature of factory administration, and its methods are gone into detail in the later chapters of this book.

Production control, like production engineering, can be and has been carried on without the existence of an industrial engineering department. However, like production engineering, production control includes some of the most important activities to be conducted under the direction and preferably under the continuous supervision of a competent industrial engineer.

9. Industrial Engineering.

When we add to production engineering and production control the planning, forming and fitting of organizations to work and men to organizations, and write out definite procedures covering the methods and systems involved in this tie-up of production engineering and production control with organizing engineering, we have what is the commonly accepted concept of industrial engineering today.

The industrial engineer considers a manufacturing establishment just as one would an intricate machine. He analyzes each process into its ultimate, simple elements, and compares each of these simplest steps or processes with an ideal or perfect condition. He then makes all due allowances for rational and practical conditions and establishes an attainable commercial standard for every step. The next process is that of attaining continuously this standard, involving both quality and quantity, and the interlocking or assembling of all of these prime elements into a well-arranged, well-built, smooth-running machine. It is quite evident that work of this character involves technical knowledge and ability in science and pure engineering, which do not enter into the field of the accountant. Yet the industrial engineer must have the accountant's keen perception of money values. His work will not be good engineering unless he uses good business judgment. He must be able to select those mechanical devices and perfect such organizations as will best suit present needs and secure prompt returns in profit. He must have sufficiently good business sense to appreciate the ratio between investment and income. He must be in close enough touch with the financial management to be able to impress upon them the necessity of providing sinking funds to provide the more perfect installations and organizations which future demands of a more educated and enlightened public will necessitate.

The industrial engineer today must be as competent to give good business advice to his corporation as is the skilled corporation attorney. Upon his sound judgment and good advice depend very frequently the making or losing of large fortunes.

10. Recognition of Industrial Engineering.

The recognition of industrial engineering as a distinct field is evidenced by the growth of the Society of Industrial Engineers. Still further recognition of industrial engineering as a distinct field is evidenced by the increasing number of colleges and universities establishing departments of industrial engineering and

THE COURSE OF STUDY

Third Article on Training Factory Foremen

By J. K. NOVINS

All Rights Reserved

STARTING out to plan a course of study for its factory foremen, the management faces a pretty stiff problem.

Although foreman training is now in vogue in a number of plants, large and small, throughout the ntry, it cannot be said that a strictly standardized course of man training has yet been developed. Attempts in this direc- have been made by the federal government, state and private itutions, and by individual firms, yet a great deal has been to the individual initiative of the employment manager, or ever is in charge of foreman study. The nature of the indus-, the size of the plant, and the experience and educational ipment of the foreman are factors that enter into consideration. efore the management plans such training it should make a vey of the conditions in the plant with a view to making the dy meet a worth-while purpose. It should also study the cational needs of the individual foreman.

It is a known fact that the average foreman is averse to book dy. More often he is skeptical about theory. *He is usually ex-workman who knows his particular job thoroughly and he apt to resent instruction by someone who may know all about ctory organization and production factors but who can be told hing or two about the particular job by the foreman himself.*

While it is often true that the foreman does not always antici-te any substantial benefits from a course of study, especially it has no direct bearing on his particular job, yet the manage-ent should consult the foreman on the matter. *It must be re-embered that no foreman training will be successful unless e foreman's interest is aroused.* In most plants foreman train-g is entirely voluntary, and unless the study is made interesting ough many foremen will stay away or pursue the studies with ly half-hearted interest.

Before enumerating the subject matter which should form the ckbone of foreman training, let us ask ourselves the question, What should be the chief object, or objects, of our foreman aining course?" This question is answered in a report issued by the Federal Board of Vocational Education, in which the objects are as follows:

1. The material presented in the course must meet a real vocational need.
2. In order to do this it must be specialized in terms of the particular occupation followed by the members of the group to which it is given.
3. The members of the group to which it is given must either have a common vocational aim or a common background of the same kind of vocational experience.
4. The membership of the group to which the course is given must be confined to individuals who are able to profit by the instructions.
5. The working conditions must be such that the members of the group can benefit by the instruction, that is, the course must be specifically efficient.

You will generally find that foremen will soon become interested in the course if they get out of it something that they can easily apply on the job.

The management must discover the weakness or weaknesses in its organization and shape the course to strengthen this weak link. Every factory organization, large or small, presents certain complexities. In the small organization it is not so much a matter of detail work, such as record keeping and filing, but the proper management of men and the elimination of waste. Left on "his own hook," the small shop foreman is liable to jeopardize the owner's labor policy by "lording it" over the men unreasonably. In the larger factory the management places a check on the foreman, and he becomes merely a cog in a huge machine. In the small plant there is a tendency to waste material. In the larger and more efficiently operated plant the management places many checks on waste, For one thing, there is a cost accounting system. The foreman must account for every man, for every machine, for every bit of material used in his department.

In the small plant it would therefore be useless to teach the

oto by Keystone

NEW STANDARDS

By Secretary of Commerce HOOVER

Continued from Last Week

A SELF-GOVERNING industry can be made to render needless a vast area of Governmental interference and regulation which have grown up out of righteous complaint against abuses during the birth pains of an industrial world.

Some people have been alarmed lest this associational movement mean the destruction of our competitive system, lest it inevitably destroy the primary individualism which is the impulse of our society. This alarm is groundless. Its rightful activities do not destroy equality of opportunity or initiative. In fact they offer new avenues of opportunity for individuals to make progress toward leadership in the community. Anyone of them will die at once if it does not offer equality of opportunity to its members; or if it restricts its membership, rival associations at once emerge. They are the safeguards of small business and thus prevent the extinction of competition. They are the alternative to capital consolidation. They are not a growth toward socialism—that is Government in all business—they are in fact a growth directly away from such an idea.

Right here for the benefit of the gloomy persons who have a frozen belief that every form of associational activity is a conspiracy to fix prices and to restrain trade, to perpetuate tyranny of employer or employe, we may remember that there are some crooks in every line of endeavor. The underlying purposes of the vast majority are constructive. A minority may be violating the Ten Commandments and need the application of criminal standards. I am speaking, however, of something more vital than porch climbing.

I am, of course, well aware of the legal difficulties that surround certain types of associational work. I do not believe that the development of standards of conduct or the elimination of abuses in public interest has ever been challenged as a violation of the Sherman Act. Moreover, to establish either a physical or a moral standard directly sharpens competition.

When standards are agreed upon by the associations representing the manufacturer and distributor and by those representing the user, we have a triple force interacting for their enforcement.

Now I do not wish any one to think my feet are not on the ground in all this, and I propose to give a few illustrations from real life of what can be effected by constructive associations and by cooperation among them.

The Department of Commerce has, at the request of the lumber industry, held a number of conferences to discuss the rules of the road in that industry and its relations to the other industries and the common good. The problem was to establish more general and more constructive standards of practice, ethics, and waste elimination.

In the toil of formulating these standards there arose a question of how thick a one-inch board should be. It sounds easy. But it quickly developed to be a question whether it should be one-inch thick when it was green; after it was dried; when planed on one side, or when planed on both sides. It developed not only that a choice had to be made among these four alternatives, but also that this choice had to be based upon a proper consideration for the conservation of our forests on one hand, and the provision of a material of such structural character as to constitute a square deal to the consumer on the other. It also developed that there were 32 different thicknesses of a one-inch board in current use and that some minority of manufacturers in the drive of unfair competition were gradually thinning the board until it threatened to become paper. There also had to be developed the exact differences which threw a board into four or five different grades, and there had to be a determination of standard trade names for different species of wood. The point was that an accurate standard had to be determined before discrimination as to fair dealing and public service could be gauged. That occasion was the foundation of ethics in one-inch boards.

These conferences established some 80 questions involving the whole technology of lumber and comprising for the first time a definite series of national standards. Here is the sum of our problem. It could only be accomplished through an association in the industry. It is proof of industrial conscience and service.

The second part of the practical problem which I enumerated before is enforcement. Again associational activities were called upon. The manufacturers were not alone in these conferences, but the distributor and consumer were also represented by the Architects' Association, the Building Contractors' Association, the Railway and other Purchasing associations, and the retailers' Associations. The action and reaction of the buyer and seller upon each other in their desire to secure fair dealing in industry can procure enforcement. Joint inspection bureaus have been erected where complaint for violation can be lodged and determination made. Enforcement may not be 100 per cent, but the standards are there and a sense of individual responsibility and self-interest will eventually, I am confident, make them universal.

For years aggrieved persons and some of the trade have been agitating this question of lumber standards in Congress. Numerous bills have been introduced. If this effort succeeds no legislation will be necessary. This is keeping the Government out of business through the remedy of abuses by business itself.

I propose now to mention one other case of a most vitally important and entirely different order, rendered possible only through associational activity in which the Department of Commerce has been in active cooperation. That is in the bituminous coal industry. There have been developed in this industry, as many of you are aware, 30 per-cent too many mines operating intermittently during nearly every week of the year with a large seasonal dip in summer. Thus they required 30 per cent more labor and 30 per-cent more capital than was necessary to produce the nation's coal. One effect of this situation was that some proportion of the employes secured too few days work to yield them a reasonable standard of living, even at the apparently high daily wage. This minority of employes was naturally a constant source of agitation and disturbance. The result of all this was a higher cost of producing coal and consequently a higher national coal bill; speculation and uncertainty to the operators; hardship and difficulty and instability to a considerable portion of the workers. The fundamental cause was a vicious cycle of seasonal fluctuation in demand, annual shortages in coal cars, and periodic strikes which grew out of the instability of labor relationships. These periods of shortened or suspended production always resulted in famine prices for coal and great stimulation to the opening of new mines.

At least four Government commissions have examined this question. Probably 40 bills have been introduced into Congress proposing Governmental regulation in an attempt to correct the abuses and wastes and public danger that lay in the situation.

The associational agencies in the field were those of the operators, of labor, of the railway executives and of the various associations of industries as consumers. The first problem was to secure a general knowledge of the causes to which I feel the Department of Commerce contributed substantially. Remedy was undertaken in many directions. The railway association induced the construction of a more ample supply of coal cars and greater expedition and interchange in handling between different railways. The Department of Commerce in cooperation with the Chambers of Commerce, manufacturers' associations, railway and public utilities associations secured that more coal should be put in storage during the summer season. The result was that last

CONGRESS—AND POLITICS

What's Happening in Washington

By JOHN M. TOWNSEND

Special Correspondent, MANUFACTURERS NEWS

DESPITE the earnest efforts of President Coolidge to bring about a working agreement between the republicans in Congress and himself so that the party responsible before the country for what is done and not done in government shall present a united front the presidential campaign, there is no outward evidence as yet the republican leaders in Congress can either lead their co- s in Congress or that they, themselves, are ready to work with White House.

n the contrary, evidence of an opposite state of affairs devel- d this week, especially in the Senate, re Senator Lodge, the republican lead- on three separate occasions made all trouble possible for the administration. he present negotiations break down and President is forced to travel alone the h he has chosen for himself with respect pending legislation, the issue not only ween the President and Congress but ween the President and the republicans Congress will be clear and unmistakable the elections this fall.

LODGE'S GAME

Senator Henry Cabot Lodge, chairman the committee on foreign relations and minal leader of the republicans in the nate, continues to call at the White House ily in his official capacity and consistent- jabs the administration in the back ienever he gets a chance. He has had ree chances this week, has jabbed twice, d is ready to jab again when opportunity ers.

Strange as it may seem, Senator Lodge, io comes from the President's own state, is one of three so-called regular republi- ns who were in doubt when the Presi- nt's friends undertook to find out whether not he would support the President's veto the Bursum pension bill. Those three ites were necessary and yet Senator Lodge ing back. How he will vote when the st comes remains yet to be seen. This is e one jab not yet delivered.

Notwithstanding the fact that Senator odge is chairman of the foreign relations committee and, as such, ight to know the amenities between nations as well as the Presi- ent and Secretary Hughes, nevertheless, when the conference port on the Immigration Bill came before the Senate with the rovision that Japanese exclusion shall not take effect until March , 1925, unless a treaty with Japan excluding Japanese is agreed before that time, Mr. Lodge gave all aid and comfort to the abid exclusionists by declaring that he personally favored a law ather than a treaty on the subject. Finally, after hearing wit- esses representing the religious and civic organizations of the and who favor the entry of the United States into the World ourt along the lines of the Harding-Hughes plan, also favored y President Coolidge, Senator Lodge has suddenly presented a iew plan to the Senate for the creation of a new court at the Hague pon which nobody has been heard.

It is clearly evident that Senator Lodge is in complete disagree- nent in detail on every item of foreign relations for which the idministration stands; that he will not approve any plan which Iughes prepares or advocates; that he is pursuing the same course n opposition to Calvin Coolidge that he has pursued toward every New Englander in Congress in twenty years who threatened his own prestige, and that he regards himself, rather than the President, as the real republican leader of his party. There is no escape from this conclusion: the record of opposition on his part is too habitual and consistent to be judged otherwise.

BREAKDOWN IN LEADERSHIP

As one high official recently remarked: "If there is anything this administration has ever done which met with the approval of Henry Cabot Lodge, I would like to know what it is."

MR. CHAIRMAN!

William M. Butler of Massachusetts will manage the 1924 Republican National Campaign and will succeed John T. Adams of Iowa as chairman of the Republican National Committee, if President Coolidge is nominated by the Cleveland convention, the President has decided.

P. & A. Photo

Complete breakdown in leadership among the republicans in Congress began with Senator Lodge. Since 1918, when he took control of a republican majority in the Senate, there has been no solidarity on the republican side of that body. The progressive republicans ignore him and many of the regulars fail to consult him. He initiates no party policies, leads no party assaults, throughout the present session has organized no party defenses against the political assaults of the democrats. Once or twice he has raised his own feeble voice in an indignant, silk-stocking protest against violations of the dignity of the Senate and once he actually praised President Coolidge, but that is all.

Exactly the same condition of party disorganization confronted the republicans in the House in 1918, which confronted Senator Lodge in the Senate, with the single exception that Senator Lodge has a treaty fight on his hands and the House leaders did not. Nevertheless the republicans in the House worked out some semblance of party solidarity and even in the present Congress, with an organized group on the republican side cooperating with the democrats, "Nick" Longworth and his associates beat the democrats in a compromise on the tax bill, lined up enough republicans to waylay the Barkley bill this week and have shown occasional signs of party solidarity on other occasions.

Undoubtedly Lodge threw in his court proposal not only to embarrass President Coolidge in his relations with Secretary Hughes but to force a compromise, if possible, on the World Court plank at Cleveland next month, which plank President Coolidge is expected to write himself. It was furthermore designed to befuddle the issue and fool the people but it has not fooled the President. According to all reports he stands where he stood last December, in favor of finding some way to join the existing World Court. Some day somebody in high quarters will get peeved and tell the truth about the gyrations of Senator Lodge who has shown himself slippery enough to make an eel look like a paralytic.

HOWELL-BARKLEY BILL

After losing a battle in the House to prevent the discharge of the House committee on interstate commerce from further consideration of the Howell-Barkley Bill, substituting a series of advisory and mediation boards without real power for the Railroad Labor Board, the republicans in the House rallied sufficiently to prevent that measure from receiving any further consideration for a period of at least two weeks. A dozen members of the

A VICIOUS BILL

AN effort is to be made on or about May 19 to jam through the Howell-Barkley Bill in Congress.

This measure abolishes the Railroad Labor Board. *That* invites strikes. The whole country—everyone—will suffer.

All railroad employes will be unionized 100 per cent under this proposed Act. It will permanently fix high wages, or make them higher.

Railroad wages inevitably are reflected in wages for factory employes, especially at industrial points where railroad shops are located. We believe in good wages to good workmen, but we don't believe in being blackjacked into artificial and ruinous rates by professional demagogues.

The labor unions are not thinking of the country's welfare. If they were, they would not attempt to put through an Act that will surely mean increased freight rates and, because of them, higher prices all around.

The Howell-Barkley Bill is a vicious attack upon the national well-being by an organized gang of self-centered labor profiteers. *Wire or write your representatives in Congress to work and vote against it.*

YOU—AND WE

AT the upper left-hand corner of this page appear the words, "Manufacturers News—A National Weekly for Manufacturers' Officials."

That's us.

Beginning with the State of Illinois, more than twelve years ago, MANUFACTURERS NEWS has gradually expanded its territory and its reader-interests until today it occupies a place peculiarly its own among other *national* publications.

MANUFACTURERS NEWS is not a "trade" or "class" journal. Its contents are unlike those of any other publications issued. It is distinctively—itself.

Its readers are the *big* men of the manufacturing world. MANUFACTURERS NEWS isn't found on the average executive's desk. It *will* be found, *every week* on the *big official's* desk—or, more likely, in his hand.

The big fellow—"the boss"—appreciates MANUFACTURERS NEWS because it is a magazine designed for *him*. In it he obtains a sweeping view of *his* world, week by week. It's his club—friendly, talkative, cosmopolitan, interesting.

"The Boss"—the manufacturers' official—is cordially invited by the editors of MANUFACTURERS NEWS to make suggestions wherever and whenever he sees fit for the betterment of *his* magazine.

CARRY ON!

SAFETY of Maj. Frederick Martin and his mechanic, Staff Sergt. Alva L. Harvey, the two intrepid army airmen forced down in Alaska in their around-the-world cruise, was a pleasurable news item of the week. All America awaited word of these two brave men. That they are unhurt and expect to rejoin their command "on the other side" is, and rightly, a subject for national rejoicing.

Development of aerial transportation rests with such men as Maj. Martin—men who, whether in military or civilian walks of life, have the courage, the vision and the tenacity to *carry on.*

It is not many years since we laughed at the automobile—nor, for that matter, since we hooted the notion of railroads. And even the younger generation can remember when, for an aviator to *fall*, meant that he would be picked up *dead.*

Mere falls—"crashes," as airmen term them—are no longer "sure death." Forced landings are not even provocative of interest. Aviation is progressing. The dangers of air travel are being eliminated or overcome.

Aviation awaits only one development before expanding as the automobile, the railroad and the steamship expanded. The development is the helicopter—the machine that, in addition to flying on horizontal lines, will rise and descend *vertically*.

When *that* is realized, all men will fly.

THE PUBLIC PAYS

EXPERIENCE is a dear school. Sometimes it's worth it.

For a good many years, public utilities and the railroads have been the special playthings of professional and amateur politicians. The professionals stepped heavily and wielded a big stick—for what there was in it. The amateurs stepped equally heavily and wielded an equally big stick—to make a big noise.

The public has been fooled many times. And the politicians, professional and amateur, have gained votes. Utilities and railroads were the "goats," and if they didn't like it they could quit.

They did—several of them.

The public suffered.

The public paid.

Experience. The country today is a great deal less gullible than in the past. Political hot air balloons aren't attracting the old crowds. The politician who attacks private industry in the hope of currying public favor is "out of luck."

The public knows. Mr. Politician probably would get a job out of his ballyhooing. But the taxpayers would get the bill.

HOOVER'S SPEECH

HERBERT HOOVER'S address before the Chamber of Commerce of the United States (the complete text of which is contained in two parts in this and last week's MANUFACTURERS NEWS) is understood to have created something of a sensation in Washington.

Coming as it does just before the Republican National Convention, it is believed to hint at the economic program upon which the President is to base his campaign.

In essence, Mr. Hoover says that business generally must voluntarily formulate and enforce rules and regulations which will bring about more ethical conduct in business.

It is a large order—but it can be filled. In fact, it is being filled. There is not a business, industrial or manufacturing association or group in the United States but what is working to that end—"new standards" of business ethics—new and *higher* standards.

We are too often given to confusing the ideal with the actual achievement. Because we do not immediately achieve the ideal, we assume we are achieving nothing. That is not the case. "Rome was not built in a day."

"UNSEEN COSTS"

By ABBOTT W. SHERWOOD

Illinois Glass Company, Alton

An address delivered in St. Louis, Mo., before the Southern Division, Illinois Manufacturers' Costs Association.

SOMEONE has said that an efficiency expert reminded him of a Welsh-rabbit—because it isn't Welsh and it isn't rabbit. Personally I do not believe that is a fair description, but never having been an expert myself I am hardly qualified to pass judgment.

nd because I am not an expert in any line I thought perhaps ight be refreshing to this group of men, most of whom I am are technical men—to listen to some thoroughly untechnical unscientific opinions about "unseen costs."

nd as a further proof that I am not an expert—even at speak- —I am inflicting these opinions on you in the form of a paper.

n business—just as in all of life—there are the "things visible the things invisible" and so there are costs which are seen costs which are unseen. The principal business of the Cost artment, as I see it, is through accurate finding of the costs ch are *seen* to point the way toward eliminating or reducing costs which are *unseen;*—just as in a mathematical equation en you are given certain known factors you apply certain rules ormulas to determine the unknown.

lobbie Burns said, "Wad some po'er the giftie gie us—to see sel's as ithers see us,"—and the modern Cost Department is ng even beyond that and is showing us as we really are. Truly vill "Fra' mony a blunder free us" through systematically re- ving the elements of uncertainty and guess work. Like the shman at the picture show who placed his hat on the next seat ere a lady failed to see it before she was seated. Very apolo- ically she said—"I'm sorry, but I believe I sat on your hat." ving an efficient Cost Department of his own the Irishman said. ou *believe* you sat on me hat! You know damned well you sat it."

In almost every business enterprise there are two principal jectives:—first, the production of a certain article or line of icles of the proper quality and at the lowest possible cost, and, ond, the sale of that article or that line of articles at a price ficiently above the production cost to assure a profit. There- e it is fairly safe to regard the Production Department and Sales Department as the two Key-operations.

But in addition to these two departments—a modern business ust necessarily have a number of other departments without hich neither production nor sale could be properly performed. w materials must be secured and transported to the plant;— finished product must be transported to the point of consump- n;—money must be collected and disbursed for material, wages d salaries;—books must be kept;—insurance must be carried; and costs must be found and the results applied before the ecutive Branch of any institution is in position to assure the vestors that their money is in safe hands.

It is the function of the Cost Department to correlate and, in a easure, tabulate all of these different activities because the cost every one of them naturally and inevitably enters into the cost the article or the line of articles which is produced for sale d which must be sold at a profit.

The cost department therefore deals primarily with the seen known costs. It knows the cost of buildings and equipment— e rate of depreciation and the annual maintenance. It knows e cost of raw material, and the fuel, and the power, and the cost the time spent by men and women in the various functions ecessary to make the completed article. It knows the amount of e freight charges which were paid to bring the raw material in nd to take the finished product to the consumer. The cost department knows the selling expense, the advertising cost, the salaries aid the salesmen—and their traveling expense. It knows the ost of maintaining the overhead departments—insurance—credit, ookkeeping, traffic, purchasing and legal departments and their ubsidiary departments.

When the cost department has found all of these figures and as compiled them in such a way that they can be carefully analyzed—it has opened wide the path whereby many of the unseen costs can be ferreted out of their hiding places.

But the unknown factor is the human equation. The most perfect machine can be wrecked, and the most perfect system can be spoiled by the human operators.

There is an old saying that a man is known by the company he keeps and this might be transposed with equal force into the statement that "a company is known by the men it keeps." This is true of the largest institution down to the smallest where two men or more engage cooperatively in rendering service for profit. And the degree of success which comes to any institution varies in the same ratio as those connected with it—through their own individual effort and through cooperation with others—keep down the unseen costs which are the direct result of carelessness, disloyalty, and ignorance. These three human short-comings are at the root of all of the unseen costs and they are the hardest things for the cost department or the management to find, for, of course, no management would intentionally have associated with it people who are downright destructive, or people who are openly opposed to its ideas or policies, or people who are so densely ignorant that they are incapable of learning.

Carelessness means without care, which means that there is a lack of personal interest in what one is doing. Disloyalty is a word of many fine distinctions and has varying degrees of meaning but in business it means anyone who does not really feel and *act* as though he feels that his or her own personal success is closely bound to the success of the institution he is with. Disloyalty may be active or passive. If a man is not true to his trust—he is disloyal to it. If he is not *for* his institution—he is against it. I am using the word chiefly in its passive sense because *active* disloyalty is treason and is more easily discovered and dealt with. Ignorance may mean either a lack of direct knowledge or failure to know how to apply that knowledge, and it is closely related to carelessness and disloyalty for anyone who is *not* ignorant should be able to recognize the fact that those who are careless and those who are disloyal not only lose for themselves but cause others to lose with them.

Practically all of the unseen costs in business spring from these three sources.

The workman who loafs—who wastes time and material—whether he be in production or sales or in the office—is ignorant of his own welfare because he is careless and disloyal. Or perhaps he is careless and disloyal because he is ignorant.

The foreman of a department who fails to cooperate with other departments or who fails to promote intelligent carefulness and enthusiasm and loyalty among his men is producing "unseen costs" through inefficiency.

The incorrect order hurriedly sent in by a salesman may not actually create a loss on the company books but it may cause a heavy addition to the cost of selling through failure to get another order from a dissatisfied customer. Or when he goes to the ball game—and his competitor gets the order because *he* was on the job. Or when he creates an unpleasant impression among the trade through carelessness in his appearance. Or the thousand and one ways in which the salesman can *mis*represent his house, to its lasting disadvantage and the piling up of heavy "unseen costs."

There is a strong movement today for "Truth in Advertising." Someone once said that Theodore Roosevelt discovered the Ten Commandments. Now someone seems to have discovered that "Honesty is the best policy." The advertising manager who is careless of the truth,—or who is ignorant of the true facts—is not only disloyal to the standards of his profession but he is creating trouble and dissatisfaction for his house, and adding to the "unseen costs."

The buyer who is discourteous to salesmen or who is unmindful of the golden rule in doing business can, in this way (as well as in many other ways), detract from the prestige of his house and add to the "unseen cost" of buying through failure to have the right kind of material at the right place, at the right time, and at the right price. He is disloyal to the interests of his house and he is careless of its welfare because he is either ignorant of its policies or the management is ignorant of what its policy should be.

The traffic manager who fails to realize that the problems of transportation can only be worked through cooperative effort;—who does not so conduct his department that the transportation costs shall be fair and satisfactory to both sides;—or who tries to take unfair advantage of a competitor—that traffic manager is ignorant of the fact that his methods are not sound and he is both careless and disloyal to the best interests of his company because in the long run he can keep only what is fair, and some day he will fail to keep what is fair, because, like the boy who cried "Wolf! Wolf!" the transportation companies will have lost confidence in him and in his statements.

The credit manager who demands his pound of flesh—who fails to realize that there is such a thing as a good moral risk and is ignorant of the fact that many times a man who intends to pay but cannot pay on the dot should be given more consideration than the man who can pay but won't—that credit manager is short-sighted, and short-sightedness is both ignorance and carelessness. He adds to the unseen cost by creating sales resistance and actually driving away business which might be profitable.

The insurance department is the Noah's Ark of business. We remember that a lot of people thought Noah was crazy—they didn't believe it was going to rain and if it did rain it wouldn't rain much. Think what would have happened to us if Noah had weakened, and had cut down the size of his Ark or reduced the specifications of the timber. When the animals went in two by two some of them would have been left out and it might have been some of our own ancestors. So with insurance—which is not of any value until the fire or the tornado or the accident actually happens; but when it does happen if the insurance manager has placed his insurance for insufficient amount or with weak companies, he has added materially to the "unseen cost" through both ignorance and carelessness. Or if through over-zealousness in endeavoring to collect for his institution more than it is actually entitled to, he arouses suspicion and antagonism in the minds of the insurance men, he is again adding to the "unseen cost" through additional premiums.

One might go on indefinitely but outside of the things that I have mentioned it has always seemed to me that the largest item in the unseen costs is the result from poor business letters. There is absolutely no way to calculate the amount of harm and expense which come from this cause. The letter which, through indifference, is not acknowledged promptly;—the information which is not given correctly;—the letter which, intentionally or otherwise, conveys the wrong impression;—the letter which is so badly phrased or badly typed as to arouse either irritation or amusement and thus detract from the selling value of the letter! Volumes have been written about these and a whole evening might be used to discuss them. They add tremendously to the unseen cost of doing business by creating resistance instead of cooperation, and the fault springs from one or all of the same three roots. The man who dictates a faulty letter—the stenographer who "balls up" a well dictated letter—each is both ignorant and careless and as such both are in a sense, disloyal to the best interests of their house.

The answer lies in the hands of management because the greatest problem in business or in the home or in the world is the problem of human relation.

Management is simply leadership. The greatest business institutions the world has seen have been built by and around one strong outstanding personal leader who has been big enough and broad enough to create an organization of specialists who *cooperate* with each other. Henry Ford is, I think, the greatest living leader in industry, and he is actually practicing something that Andrew Carnegie said—that he attributed the success of his business to the fact that he had surrounded himself with men who knew more than he did.

Carnegie also said, "A man is valuable in business just so far as he is able to work with other men." How true that statement is, every one of you know, if you are part of a big organization.

That, then, is the problem of leadership—or management. T secure or to induce men to cooperate—to work together in harmony with each other and in harmony with the ideals of the organization.

And true cooperation—true working together means that each one must not only do his part, and do it well—but he must do it in such a way that others who *need* to know *will* know that it is being done.

The admonition not to let "your right hand know what your left hand doeth"—cannot be used in industry; but there must be the most painstaking teamwork which can only come from full understanding.

And how shall this problem of arousing interest, and enthusiasm and cooperation be solved? The word "management" is such an abstract term. Too often we think of it as a sort of impersonal thing. But as a matter of fact *management* is nothing more or less than a group of human beings who have accepted personal responsibility. Just a group of men,—with the same tastes and appetites and habits as the rest of us,—who are responsible for the results of work done by other men.

Every man who has charge of other men is a part of the management. If they all feel that personal responsibility of leadership—if each one realizes that he has a duty to the men *under* him as well as to the men *over* him—if each one, as he advances in responsibility, can remember and be guided by the remembrance of his own experiences on the lower rungs of the ladder,—then the problem is being solved.

If management, and each part of management, feels that *personal* responsibility to judge and act calmly,—to deal fairly and squarely,—to take the good breaks without elation, and the bad breaks philosophically—then the problem is being solved.

When the management of an institution, from the president to the foreman, has developed that thing called "character"—then the problem will *be* solved.

In and address delivered at Norton, Massachusetts, in June, 1923, Calvin Coolidge said:

"We do not need more material development, we need more spiritual development. We do not need more intellectual power, we need more moral power. We do not need more knowledge, we need more character. We do not need more government, we need more culture. We do not need more law, we need more religion. We do not need more of the things that are seen, we need more of the things that are unseen."

Industry—as President Coolidge said—needs more of the things like truth and fairness, and character, that are unseen.

I personally have never thought very highly of the phrase or the schemes covered by the phrase "Industrial Democracy." I can go further than that and say that from what I have observed and read—I do not believe in the effectiveness of democracy of any kind as a form of government whether of states or institutions.

The United States of America, thank heaven, is a republic—a government by representation, under a constitution which clearly sets forth the purpose and powers of government. We have strayed pretty far away from it but I believe we are coming back.

It is my strong belief that an industrial enterprise should be directed as a republic or a representative government.

The unwritten constitution would be that everyone connected with the institution is entitled to life, liberty, the pursuit of happiness, and opportunity for advancement. The object of the institution is to render a public service in return for which the institution and those connected with it would profit as it and they deserve. And the cornerstone of this institution-republic will be the Golden Rule.

Under this unwritten constitution the foremen would be the representatives of their respective groups. The superintendents and division managers would represent their groups of foremen. The officers would represent the different departmental activities, and the spirit and the intent of the institution would be represented by its president, and directors.

When some such plan as this can be put into practical operation—when the spirit of such a constitution can permeate an institution from the top to the bottom—then all of these unseen costs will disappear.

Illinois delegation voted to discharge the committee but some of them reconsidered their actions when it came to forcing the bill up for immedate consideration.

In the meantime, the democratic-LaFollette coalition in the House has moved again, this time to force the discharge of the same committee from further consideration of legislation to repeal section 15-A of the Esch-Cummins act requiring the Interstate Commerce Commission to fix rates so as to produce an income to the railroads not to exceed 6 per cent, including the fixed charges to which they are liable above operating expenses. It is clearly evident that LaFollette is paving the way to force this legislation through if possible, and to prevent an adjournment until a vote is taken.

Thus far the democratic-progressive coalition has not accomplished much constructive legislation which will look well to the voters. While the democrats have the votes, LaFollette has the honor of suggesting most of the legislation which both the democrats and third party advocates regard as good campaign bait and the question now is whether the democratic party is becoming the catspaw of LaFollette or whether LaFollette is the catspaw of the democrats. The democrats cannot pass any legislation without LaFollette, so that it looks as though the Wisconsin senator has the democratic party on the hip.

VETOES COMING

A veto of the bonus bill is confidently expected to come from the White House at any time. The President has been working on both houses for support of his veto of the Bursum pension bill which takes $58,000,000 out of the treasury next year. He has withheld his veto message on the bonus bill, appropriating $135,000,000 until that contest was settled.

There is no doubt but that the President will veto the tax bill unless it is materially changed in conference. While the President might not balk on a mere question of a difference in rates between the Mellon plan and the House bill, fixing maximum surtaxes at 37½ per cent, he will not accept several of the Senate amendments, including publicity for all income returns, the new corporation tax and some minor features. The republicans in the House are mustering their strength to support the President against the Senate and if they can hold their ground, there is a chance for a tax reduction bill at this session. If the President does veto the bill and is sustained, Congress will be afraid to quit without reducing this year's taxes at 25 per cent, which is all the benefit the taxpayer will get in 1924 anyway.

If the amended Japanese exclusion feature stays in the Immigration Bill, the President probably will sign. Work is now being done on an agricultural relief bill to be passed before adjournment, but if the compromise measure is no better than the McNary-Haugen bill the President will think twice before signing it.

DEMOCRATIC LINEUP

A composite of the views of democratic leaders in Washington shows that William G. McAdoo will go into the New York convention with approximately 475 votes on the first ballot, 75 less than a majority and 257 short of a nomination; that Gov. Smith of New York will have around 240 votes; Senator Underwood, 175; James M. Cox, 75 and the balance scattering. If McAdoo and Smith cannot compromise, one of the other candidates, or a "dark horse," should win.

Fyrac Buys Clymer Spotlight

The Fyrac Manufacturing Company, Rockford, Illinois, makers of the Fyrac Night Guide, have purchased the complete business, good will and assets of the Clymer Manufacturing Company, Denver, Colo. Both companies are engaged in the manufacture of through-the-windshield spotlights. Operation of the two companies will be continued separately. The offices of the Fyrac company will remain in Rockford, and those of the Clymer company will remain in Denver, Colorado. The Clymer company will be under new management.

Central "Y" Reunion May 19

"Old Boys" who formerly attended Central Y. M. C. A. Schools (Chicago) will hold their Thirty-fifth Annual Reunion Dinner in the "Y" May 19, at 6 p. m. F. L. Bateman, Central Y. M. C. A. Schools, 19 S. LaSalle st., Chicago, is chairman of the reunion committee in charge of reservations.

Biflex and Halladay Consolidate

Olson & Enzinger, Inc., Watkins bldg., Milwaukee, advertising agency have announced a consolidation of the Biflex Products Company, Waukegan, Ill., and the L. P. Halladay Company, Decatur, Ill., manufacturers of automobile bumpers.

Otterson Promoted

N. E. Otterson, formerly of the New York District sales office of the Osgood Company (Marion, O.), manufacturers of excavating machinery, has been transferred to Chicago to become district sales manager there. C. C. Phillips, former Chicago district sales manager, has resigned to go into business for himself.

Chandler to Merchants Exchange

W. H. Chandler, manager of the transportation bureau of the Boston Chamber of Commerce, will succeed the late J. C. Lincoln as manager of the traffic bureau of the Merchants Exchange, of New York, according to a late announcement.

New Service on Munson Line

Effective today (May 17), the Munson Steamship Line begins a bi-weekly service from New Orleans to Matanzas and Caibarien, Cuba.

Power Transmission Text

A very complete text book on power transmission, particularly silent chain transmission, has just been issued by the Ramsey Chain Co. Inc., Albany, N. Y., manufacturers of the "Chain with the Compensating Joint." It is a 6x9, 48 page book in two colors, beautifully illustrated and bound, and treats of the various methods of drives—leather and rubber belting, gearing, direct, and silent chain. It also covers the transmission problems in the following fields: textile, machine tool, punch presses, shears, wood-working machinery, fans and blowers, mixing machinery, grain elevators and flour mills and pumps.

Continued from Page 8

for the first time in many years we had no interruption in listribution of coal due to car shortages. One element of the us cycle in this situation is eliminated, provided we can con- this same cooperation in future.

ie second part of the solution was the general agreement by operators and labor that stability could not be restored in ndustry unless there was a long period of continuous opera- in which the absence of coal famines and profiteering would inate the speculative and high cost producer and reduce the s in the industry and thus its intermittency. The labor agree- t between these associations made last February for a term hree years has assured this improvement.

ere we have an example of the most profound national im- ance in at least the beginning of stabilization of an industry lved in a most vicious cycle of waste and trouble. The na- al savings can be measured in hundreds of millions and the ian hardships greatly lessened. There will be some prelim- y hardship in so great a self imposed surgical operation but n confident it will heal to the mutual interest of the operators, public, and the workers. Today I do not believe there is any iment for Government regulation of the bituminous coal in- try.

could give you a multitude of examples of the beginnings of structive self government in industry among many other Asso- ions. The very publication of codes of ethics by many associ- ons instilling service as the primary purpose; the condemnation specific unfair practices; the insistence upon a higher plane relationship between employer and employe—all of them at least indications of improving thought and growing moral ceptions.

All of this is the strong beginning of a new force in the busi- s world. The individual interest is wrapped up with public erest. They can find expression only through association. ree years of study and intimate contact with associations of onomic groups whether in production, distribution, labor or ance, convince me that there lies within them a great moving pulse toward betterment.

If these organizations accept as their primary purpose the lift- of standards, if they will cooperate together for voluntary forcement of high standards, we shall have proceeded far along road of the elimination of government from business. Ameri- n business is never secure unless it has public confidence behind Otherwise it will always be a prey to demagoguery and filled th discouragement.

The test of our whole economic and social system is its capacity cure its own abuses. New abuses and new relationships to the iblic interest will occur as long as we continue to progress. If are to be wholly dependent upon Government to cure these uses we shall by this very method have created an enlarged and adening abuse through the extension of bureaucracy and the umsy and incapable handling of delicate economic forces. The d law merchant is the basis of much of our common law. A naissance of a new law merchant could so advance our standards to solve much of the problem of Government in business.

American business needs a lifting purpose greater than the ruggle of materialism. Nor can it lie in some evanescent, emo- onal, dramatic crusade. It lies in the higher pitch of economic fe, in a finer regard for the rights of others, a stronger devotion obligations of citizenship that will assure an improved leader- iip in every community and the nation; it lies in the organiza- on of the forces of our economic life so that they may produce appier individual lives, more secure in employment and comfort, ider in the possibilities of enjoyment of nature, larger in its pportunities of intellectual life. Our people have already shown higher sense of responsibilities in these things than those of ny other country. The ferment of organization for more definite ccomplishment of these things in the practical day-to-day prog- ess of business life is alive in our business world.

The Government can best contribute through stimulation of and ooperation with voluntary forces in our national life; for we ius preserve the foundations upon which we have progressed so ar—the initiative of our people. With vision and devotion these oluntary forces can accomplish more for America than any pread of the hand of Government.

10¢

a motor-year kept these

80 ball-bearing motors in repair through eleven years of dust and heavy overloads

If you use motors, particularly if you use motors in severe service, you should read every word of this owner's story:

"For eleven years the cost of repairs on over eighty Fairbank-Morse ball bearing motors installed in our wood-working plant has averaged only 10 cents per motor and starter per year.

"These motors have been in continuous service since 1912. The dust conditions under which they operate are unusually bad and the load fluctuates suddenly from no load to a heavy overload."

For twelve years ball bearings have been a *standardized unit of design* in Fairbanks-Morse motors. Ball bearings keep the oil out of the motor windings. They are dust-tight. They insure the rotor against striking the stator. They require lubrication only once a year—twenty minutes work for one man.

It will pay you to find out about these motors FROM USERS in your own industry

THE McFADDEN BILL

THE most striking features of the McFadden Bill, which, after having been under consideration by the committee on banking and currency for several weeks, has now been reported to the House as H. R. 8887 with considerable revision, are those dealing with branch banking.

The policy of the bill is to outlaw what is known as state-wide or country-wide branch banking. This is in accord with the views and desires expressed in opposition to branch banking last Autumn by Comptroller Dawes.

State banks, under Section 1 of the bill, would be permitted to consolidate with national banks only upon relinquishing any branches which they may have outside their home cities. Section 8 of the bill would prohibit national banks from having branches in any state which does not permit branches to state banks. It further prohibits national banks from maintaining branches outside their home cities, although it permits a national bank, upon approval by the comptroller of the currency, to establish branches in its own city where such privileges are usual to state institutions.

This latter provision for the establishment of city branches by local national banks is declared to be a measure of protection to the national banks, since, it is claimed, in a number of cities the branch banking facilities of state banks have put them to serious disadvantage.

Section 7 reenacts the old amendment of 1865 which permits a state bank, upon converting into a national bank, to retain in operation whatever branches it might have. It has been by virtue of this amendment that national banks, in the cities where state banks are permitted to have branches, have been able to engage in branch banking. This is what has been called "the back-door method." Under this section of the bill no such converting State bank could now come into the national system and elect to retain any branches which it may have in operation outside of the city in which the parent bank is located. This provision, it is said, will bar from the national banking system all of the great branch banking institutions in California, since it is unlikely they would ever make the sacrifice of dispossessing themselves of their out-of-town branches in order to become national banks.

The corollary of Section 7 in this respect is Section 9. This section would prevent any state bank from becoming a member of the Federal Reserve System without, as a condition precedent, giving up any branches which it may have in operation beyond the limits of the city of the parent bank. The immediate effect of this provision is definitely to exclude several large State banks in California from the Federal Reserve System. This section would also stop the further spread of state-wide branch banking in the Federal Reserve System by making it unlawful for a member bank to establish, after the enactment of the bill, any new branches beyond the corporate limits of the municipality of the parent bank. The status of existing branches is not affected.

The cumulative effect of the other sections of the bill is to make an important renovation of the charter powers of the national banks. Among the bills important provisions in this respect are those providing indeterminate charters in place of the present 99-year term; legalization of the position of chairman of the board; direct consolidation with a state bank under national charter; legalizing of stock dividends; clarification of Section 5200 of the Revised Statutes by making clear what paper is exempt from the 10 per cent loan limit to any one individual; enlargement of the powers of the Federal Reserve banks to rediscount commercial paper, and punishment under Federal law of the robbery of a national bank, the obtaining of credit through false financial statements with intent to deceive and the circulation of false reports for the purpose of wrecking the bank. The power of a national bank to loan money upon the security of improved city real estate is increased by changing the time limit of the loan from one to five years. The proportion of time deposits which may be so loaned remains at one-third as in the present law.

The question of departmental banking for national banks was

idered by the committee. Several
ers from California urgently recom-
led that the committee include in the
provisions similar to those in the Cali-
ia Banking Law under which the state
s are operating in three separate ca-
ties—namely as commercial banks, as
companies and as savings banks—un-
a single charter but with capital segre-
d to each. The theory of this plan
is to be that a bank may fail in one
artment and remain solvent in the oth-
However, from the bill as reported
it appears that the Committee was not
ly to espouse that kind of banking.

Hooper Reelected

espite his announced opposition to
ther term, Ben W. Hooper of Newport,
n., was reelected chairman of the United
es Railroad Labor Board this week on a
ion offered by Edwin F. Morrow, for-
governor of Kentucky. G. W. W.
iger, the third public member of the
rd, was selected vice-chairman.

H. H. Windsor Dead

Ienry Haven Windsor, founder and
lisher of *Popular Mechanics Maga-*
e, died Monday in his home in Evanston,
Mr. Windsor was 65 years old. Fun-
l services were held last Tuesday.
Ir. Windsor achieved a remarkable rise
a publisher, having been one of the
t to inaugurate a magazine of science
ritten so you can understand it." He
survived by his widow and one son, H.
Windsor, Jr.

Order Rates Reduced

Without a roll call, the Senate this week
ssed a resolution, reported by Chairman
ith from the interstate commerce com-
ttee, directing the Interstate Commerce
mmission with the least practicable de-
to lower freight rates on agricultural
oducts, including livestock.
The resolution declares agriculture to
a basic industry and that it is the policy
Congress to promote, encourage and
ster that industry. The commission is
ected to promote such lawful changes in
rate structure as will promote freedom
movement of agricultural products
ompatible with the maintenance of ade-
ate transportation service."

Hardwood Mfrs. Elect Officers

E. B. Norman, of E. B. Norman & Co., Louis-
le, Ky., was elected president of the Hardwood
anufacturers Institute, at the annual meeting
ld in Louisville last week. He succeeds C. H.
errill, of the Sherrill Hardwood Lumber Com-
ny, New Orleans, whose term expired. Other
icers elected are: John Raine, Meadow River
umber Company, Raineville, W. Va., first vice-
esident; J. W. Link, Kirby Lumber Company,
ouston, Texas, second vice-president; C. C. Dick-
son, E. Sondheimer Company, Memphis, treas-
er. John M. Pritchard was reelected secretary.

Outdoor Life Conference

Call for a national conference on outdoor life
d recreation has been issued by President Cool-
ge. The conference will be held May 22 to 24
Washington.

Closing The Books

Use the Date that Suits You Best

Habit is a wonderful saver of mental effort. But too close adherence to habit in business limits efficiency by shutting off initiative.

This is particularly true in the adherence of general business to the habit of following a fixed date for closing the so-called "fiscal" year.

The best date for closing the books and preparing financial statements for the "fiscal" year is when business is in its most liquid condition—when bank loans and other liabilities are lowest, accounts receivable reduced, and, especially, when the inventory is at a minimum.

The most logical date for closing *your* "fiscal" year is that time when *your* business is logically over for the twelve months—when stocks are lowest—when prices are normal—when selling is not being forced—when you are not buying heavily—when profits can be most accurately determined—when your accounting department is not working nights, or your bank is not burdened with December 31st reports. In other words, close *your* books when *your* business is most naturally through with the rush of *your* year, when proper time and attention can be given, and your public accountants can serve you best.

Continued from Page 12

This may be altruism and it may be that the selfishness of human nature will put it off for a long time, but we are living in an age of industry, and if we have no ideals—no star to guide us, modern civilization will fail. We must—as the poet said long age—"Still achieving, still pursuing, learn to labor and to wait."

And, because this is an association of manufacturers, no closing seems quite so fitting as this recent poem by Edgar Guest:

What do you see in a factory?
Wheels that turn and fires that blaze,
Metals twisted in countless ways.
What is the coal and what is the ore
Heaped and piled at the factory door?
What is this army of men about,
Hurrying in and hurrying out?
Is it only something that's being made?
Is it only an evidence of trade?

This I saw in a factory—
A kindlier world than war can make.
A world where fewer hearts shall break,
For the coal and the ore mean a thousand things,
Beyond iron wheels and gears and springs;
And I said to myself, there is bread in there,
There are clothes for the children of men to wear,
There are schools and churches and books to read
And every blessing which mortals need.

This I found in a factory—
As the army came and the army went,
A grave man over his problems bent;
"Oh, we know so little," he slowly said,
"But each day shows that we've gone ahead;
Yes, each day finds us with something done
Which makes life better for every one,
And whenever the light of knowledge breaks,
The world is freed from its old mistakes."

I thought as I stood in that factory:
'Tis here that a nation lives and dies,
From the ore and the coal must glory rise;
Here where the metals are mixed and poured
Shines civilization's surest sword.
'Tis here that the lasting things are done
And the world made better for every one;
'Tis here, in a factory, wise men see
A glimpse of the world that shall come to be.

HOOVER ASKS AID FOR COAL TRAFFIC

THE following letter on the subject of cooperation between shippers and the railways with respect to efficient handling of the national coal traffic has been addressed by Secretary of Commerce Hoover to national and state trade associations in the United States.

"During 1923 the railways through the cooperation of the manufacturing the distributing trades and the coal operators and distributors were able to handle the national coal traffic in a most efficient manner without car shortages. This was accomplished to a considerable degree by cooperation among the trades for the purchase and storage of coal during the summer season. As you are aware, the great danger point of traffic congestion is the fall season when the combined crop, winter goods, and household coal movements have always, except through last year's cooperation, combined to create a car shortage.

"There is, therefore, every transportation and financial reason for storing coal during the next few months in preparation for the autumn need. It would be a contribution not only in the interest of the consumer but of the railways and the coal industry if we could this year produce the same successful results that your association so materially assisted in bringing about last year."

ıct courses in industrial engineering. These courses have designated in some colleges as courses in engineering admin-ion. The terminology and content matter in such courses not yet become stabilized. Most of them still remain com-tions of courses in engineering fundamentals with class work ted from the courses in business administration or commerce finance. As the understanding develops among engineers educators of what is really involved in production engineer- production control and industrial organization aside from fields of commerce and finance and engineering fundamen- there will, no doubt, be a training in those essential branches ıdustrial engineering also.

ɔ be sure, there are some men lacking in ability in any of aforementioned lines and without any engineering training, still insist on calling themselves industrial engineers but r number will become less as the business and industrial lds come to a clear understanding of what is involved in real ıstrial engineering.

11. Limits of Industrial Engineering.

ıdustrial engineering has suffered a considerable setback in development not only because of the adoption of the title by erprepared and inexperienced men but also by reason of the r-ambitious statement of its scope and aims by some of its well-ıning friends and promoters. Some of these have defined ıstrial engineering as the formulated science of management ıpplied to any undertaking in which human labor is directed ıccomplish any kind of work. There is such a broader field in ch definite principles have been established. This broader d is today designated as management; its principles and meth- are called management science and some of those who profess mselves as capable of giving competent advice in management ence are willing to designate themselves as management en-eers, although, from a standpoint of engineering ethics, the title ıgineer" should be used only by a man who has attained an en-eer's degree.

Management Science and Management Engineering.

As soon as Frederick W. Taylor's writings and accomplishments re generally known it became quite apparent that some of the inciples developed as an outgrowth of Taylor's philosophy of entific management of industry were capable of universal ap-cation. The management of any undertaking, whether it be ucational, political, military, religious, financial, mercantile industrial, can best be developed by following the same prin-les which Taylor applied to factory management.

These principles include analysis, research, measurement of isting organizations methods and results, standardization, meas-ement under standardized conditions, control through planning. eparation, scheduling, dispatching and inspection, functional ganization, selection and training of workers and equitable pay-ent based on individual efficiency.

Messrs. Church and Alford have defined management principles condensed form as:

A. Systematic use of experience.
B. Economic control of effort.
C. Promotion of personal effectiveness.

13. Taylor's Definition of the Methods of Industrial Management.

Fred W. Taylor summarizes the methods of industrial manage-ent as follows:

(1) *The Establishment into Scientific Form of all of the Working Data and Rule of Thumb Knowledge Relating to a Given Industry.*—As an example of the practical application of this method we have Mr. Taylor's own exhaustive treatise on "The Act of Cutting Metals."

(2) *The Scientific Study of the Workers.*—To illustrate what sort of investigation this involves we may again refer to Mr. Taylor's investigations as to the physical and tempera-mental qualifications of men best adapted to such work as shoveling iron ore, carrying pig iron, etc.

(3) *Bringing the Science to the Worker.*—This is accom-

ILLINOIS NORTHERN
RAILWAY
AND CONNECTIONS

Manufacturing Locations for Sale

Along the lines of the Illinois Northern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Illinois Northern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

For complete information, including rates for transportation and prices of land, apply to

NORTHERN States Power Company has arranged additional financing through sale of $5,000,000 6½ per cent gold notes maturing Nov. 1, 1923, to Guaranty Company, H. M. Byllesby & Co. and Spencer Trask & Co. The issue is being offered publicly at 97½ and interest to yield 6⅞ per cent.

Proceeds of this transaction will go toward the 1924 construction program, including completion of the initial installation in the High Bridge power station and a new turbine at Sioux Falls, improvements at the Riverside steam station, completion of the Aldrich substation in Minneapolis and other additions and improvements.

P. B. Schuss, manager of the Trenton (Mo.) Gas & Electric Company, this week announced the construction of two new transmission lines, one from Trenton to Galt, ten miles, at a cost of $20,000, and one to Cainesville, twenty-seven miles, to cost $50,000. Galt will take about 3,000 and Cainesville about 7,000 kilowatts each month. The company recently made a contract with the municipality of Gallatin to take energy from Trenton for a long term of years.

Construction on the electric transmission system of the Community Power & Light Company between Marlin (Tex.) and Groesbeck is making rapid progress. When completed this line will connect the Mexia and Marlin plants.

The Kansas City (Mo.) Power & Light Company has started to increase its potential output 30 per cent, from 90,000 to 120,000 kilowatts. The 1923 output of 290,000,000 kilowatt hours was an increase of 66 per cent over 1920. The company serves directly towns in nine counties in Missouri and two counties in Kansas. It delivers energy, wholesale, to other companies, which distribute it, in ten Missouri and four Kansas counties. Meters in service number 104,480, an increase of 29,468 since 1920 and a 40 per cent larger gain than in the four years previous to 1920.

Manila Electric reports earnings, for the year ended Dec. 31, 1923, of $1,060,789 (net income after taxes)—equal to $15.15 a share on $7,000,000 capital stock outstanding, as against $1,063,646 or $21.27 per share in 1922. Iowa Southern Utilities reports net income of $445,985 for 1924, as against $416,196 for 1923. Portland (Ore.) Electric reports net earnings of $4,174,373 as against $3,799,642 the year before.

The fifty noiseless street cars ordered by the Chicago Surface Lines from the Lightweight Noiseless Electric Street Car Company of Minneapolis will be built at the shops of the Twin City Rapid Transit Company. This marks the first step in a plan to establish a street car building industry, with nation-wide distribution, in the Twin Cities.

Construction of the 3,800-pound cars, incorporating features of the noiseless type which attracted attention of the nation's car building engineers to the Twin City lines, is to begin at once. The Snelling shops of the Twin City Rapid Transit Company are to operate at capacity, employing at least 100 additional men.

Other cities are considering adoption of the twin city type of noiseless cars, and contracts may be let for their construction in the Snelling shops according to Horace Lowry, president of the Twin City Rapid Transit Company.

The contract awarded by the Chicago Surface Lines involves about $750,000. The car building company was organized by A. L. Drum & Co., Chicago. The Twin City Rapid Transit Company has entered into contract with the new company to build the cars in its shops. The first of the Chicago cars are to be delivered by August 15 and the last by October 15. The cars adopted by the Twin City system are of lighter construction than the type adopted by Chicago.

A TRADE OPENING

Business Awaits American Exporters Here

XTY-FIVE percent of all the products of the Straits Settlements go to the United States, says Consul General E. L. Har- n a report from Singapore, and yet at the present time there ot a single American exporting firm in that place.

iose located in Singapore during the war were attracted by ial conditions then prevailing and have long since disappeared n the scene. There is but one American firm interested in elling end and this office is maintained more as a distributing er than as an agency for getting new business. There is one American advertising agency, but it limits its activities lacing American firms in contact with prospective buyers.

ie principal articles imported into Singapore are cotton piece- ls and textiles, drugs and medicines, cigars and cigarettes, ring apparel and hardware of every description, electrical liances, motor cars, soaps and perfumes, stationery, tools, and lements.

f the $2,000,000 annual importation of drugs and medicines, 000 is the largest amount which has originated in the United es, Great Britain supplying the rest. No less than $12,000,000 th of cigars and cigarettes are purchased each year in Singa- for Malayan consumption. America's share of these imports unts to only $2,500,000.

nports of wearing apparel have attained nearly $5,000,000 in ie, of which scarcely $50,000 come from the United States. $7,000,000 worth of hardware and cutlery used by the colony year, American manufacturers supply scarcely anything.

he soap and perfume trade of the colony is controlled by nce and England. The greatest of all importations, cotton e-goods, which aggregate $60,000,000 in value yearly, come ost entirely from Great Britain.

Continued from Page 7

men complicated record-keeping system that would serve no lent purpose. On the other hand, stress should be laid on elimination of waste, the improvement of operating conditions, that more production could be obtained under the limited p facilities, and getting more production from individual kmen by cutting down needless operations and reducing idle- s. Of course, it wouldn't hurt to introduce the foreman to the re elaborate system material, such as proper record keeping, so much of the material should be served out as the foreman ld easily digest and apply on his every-day job. In other ds, *the instruction should serve to make his job easier for*

he labor element is none the less important in the larger l more efficiently run plant, but it takes on a slightly different ect—at least as far as the foreman is concerned. Government estigators estimate that 70 per cent of the foreman's problems the large plant is concerned with labor management. Not y is the foreman concerned with more production-per-man, he must help the operative adjust himself to the machine and the process. This involves a knowledge of the machine, the cess *and the entire factory system,* and without such knowledge foreman cannot properly cooperate with the management to p the laboring man adjust himself.

A great deal of the trouble in the modern factory grows out of tendency of the foreman to follow instructions blindly, with- regard to the human instincts of the workman and the relation the individual executive to the firm's management policy.

An examination of the foreman training courses given in factory ablishments show that labor management forms a most im- tant branch of the study. With that comes instruction in the ing out of work, filling out and filing of important records, handling of material and equipment, safety work and sanita- n.

The foreman is given an insight into the workings of the other tory departments, such as the cost department, the employment nager's office, and even into the operations of the sales depart- nt. The foreman learns how to cooperate with these depart- nts to help lower the direct labor cost on the production, to

maintain a high quality product and to maintain delivery schedules of the raw and finished products.

The safety factor is important, as it has been shown that the foreman is largely responsible for failure of workmen to report slight injuries sustained during the workday.

The greatest weakness of the factory foreman is misunderstanding of the significance of cost accounting and his lack of cooperation with the cost department. During the course of the workday the foreman is required to fill out certain records. In a good many plants the foreman is rid of this detail by assigning the work to a clerk especially trained for the work. Nevertheless the foreman is responsible for the proper filling out of the records. He must see that the records are sent to the proper offices without delay. He must see that they are correct in every way, that they are kept in prescribed form, that they are kept to date, that they are legible, and he must know offhand which of the records could be reported orally.

If the foreman is already familiar with the general process of manufacture his course of study should stress plant machinery, equipment, materials and processes and the various statistical helps which he requires during his day's work.

The modern foreman shows his efficiency by his manner of handling records in his department. He has his "order of work" sheet, on which he enters the number of each machine and the job assigned for each machine. This sheet he must send to the superintendent's office for approval before operations on the job can begin. He has other records, such as records of men employed in his department, men idle, machines idle and reasons for idleness, reports on delays in production and tardy arrival of tools and material. The filling out of these records will prove an irksome task unless the foreman is informed of the significance of the cost department, unless he is informed through the medium of proper instruction how the cost department makes use of these records in figuring the cost of the finished product and how the sales department is helped to plan sales campaigns on the basis of cheaper production. He begins to realize that an idle machine means a loss of money. During the period of idleness the factory loses interest on the cost of the machine, on its depreciation, and on operatives being paid for doing nothing.

Waste of material in his department may not amount to much but proper instruction will impress the foreman with the astounding fact that the sum total of waste in twenty or thirty departments may run into a hundred thousand, and even a million dollars a year.

By telling him of the methods by which the storeroom, the employment department, the power house and other departments operate, the foreman learns how to cooperate more efficiently with these departments in the future.

More recently, another factor in factory organization has come into the foreman's sphere. This is the matter of job analysis. By analyzing the various processes entering into the manufacture of an article and in turn analyzing each process the factory management is enabled to eliminate unnecessary processes and thus reduce the cost of production. The foreman is expected to cooperate intelligently in the job analysis and to help the management reap the harvest from this simplification process.

The question presents itself whether the study of economics, finance and management and personnel problems in general should form part of the foreman's training course. That depends on the length of the course. In some plants the general courses precede the technical studies, such as were touched on above. In other plants the general courses are given after the foreman has completed a course of study of a strictly technical nature, on the theory that by that time he is more receptive to generalized study.

(NOTE: The fourth article of Mr. Novins' series, "Forming the Study Group," will appear in next week's MANUFACTURERS' NEWS. Requests for additional copies containing the first and second articles of the series (twelve in all) are being filled as quickly as possible. Our May 3 issue, however, is practically exhausted and that for May 10 is rapidly dwindling. It probably would be wisest for officials desirous of receiving additional copies to order them in advance hereafter.)—EDITOR.

. H. SIMMONS HEADS STOCK EXCHANGE

"Youngest Financier" Elected President of N. Y. Mart

om brokerage clerk to president of the York Stock Exchange in twenty-seven .

at is the career in the fewest words ble, of E. H. H. Simmons, newly ed head of the heart of the American world. But what a world of romance etween these lines of type.

erk at twenty, member of the firm and ber of the stock exchange three years ; and then an unbroken rise to in- ce, responsibility and the confidence of ssociates until he becomes one of the popular choices for the presidency of Stock Exchange in the history of the d street institution.

hen admitted to the stock exchange in arly twenties Mr. Simmons was one of youngest ever to gain a seat. Today, ident at forty-seven, he has again set cord by becoming one of the youngest nciers ever to occupy so important a tion.

espite his comparative youth, however, ncial and stock trading circles, both and out of town, agree in applauding choice of Mr. Simmons as successor to mour L. Cromwell as president. He is of the best qualified and best experi- d men that could possibly have been cted, is the universal verdict.

he new head of the stock exchange has n prominent and active in its affairs management for many years. He has n vice president and is thoroughly unded in all departments through mem- ship on many of its committees.

le was a member of the business conduct mittee, the law committee and member chairman of the odd lots committee, all these bodies dealing with matters of the hest importance to the well-being and stige of the exchange.

The new president is connected with the Harriman family, his name being E. H. Harriman Simmons. He is known as "Harry" Simmons familiarly and affectionately by his many friends and associates.

He is a member of the brokerage firm of Rutter and Gross, 52 Broadway, a well established and substantial house with a splendid reputation for conservation and strength.

The election of Mr. Simmons recalls to members of the exchange the presidency for two terms of J. Edward Simmons, famous lawyer and Democratic leader who piloted the exchange through the perilous waters of the panic of 1884.

The election to the presidency is an annual procedure, it being the custom of the exchange to accord reelection as a matter of courtesy.

Comment in Chicago on the election of Mr. Simmons was marked by satisfaction and even enthusiasm. Charles T. Atkinson, secretary of the Chicago Stock Exchange, voiced the general feeling when he said:

"The selection of Mr. Simmons is an admirable one. I know of no one better qualified to fill the position."

Harry A. Brennan, Roscoe C. Conklin, E. L. Jones, A. J. Lane and W. E. Valentine were elected members of the board of governors for one year, while the following were elected for two year terms: John Brennan, H. D. Bultman, Roger Dunscombe, R. Tracy Falk, S. R. Green, W. S. Hautau, Jerome Kennedy, L. A. Looram, Gerry Philbrick and W. E. Power.

At the Consolidated Stock Exchange, Thomas B. Maloney, who has been chairman of the law committee, was elected president to succeed Laurence Tweedy. Mr. Maloney and the other officers elected with him will assume their new duties the first Monday in June.

G. M. Contract for Handeyside

ontract for the road work at the General tors proving ground, a tract of 1,146 acres in neighborhood of Milford, Mich., has been let he C. A. Handeyside Construction Co., Detroit, work will begin at once, with W. J. Lehner, Clemens, Mich., as engineer in charge of con- ction. It is estimated that six months will required to construct the stretch of more than t miles of concrete and gravel roads which be used for testing cars. A force of 100 or e men will be required. Approximately two es of concrete roadway, 20 feet wide, will be t: one mile will be a perfectly level, straight- y course, with 20 feet gravel turns, and the er mile will be concrete road of varying grade, to as high as 12 per cent. All of the concrete struction will be installed in accordance with specifications of the state highway depart- nt.

New Office, Marvin & Pleasants

arvin & Pleasants of New York, international yers, have established a branch office in the amber of Commerce Building, Chicago. At- ney Dwight K. Emigh and Clifton Hildebrand e been placed in charge. Marvin & Pleasants cializes in foreign legal business and services manufacturers.

Baldwin, Inc., Has New Branch

Nathaniel Baldwin, Inc., manufacturers of high-grade radio loud-speakers and headsets, have established a branch for Mid-West distribution in the building leased by the Midland Warehouse & Transfer Company, 1524 S. Western av., Central Manufacturing District of Chicago. J. L. Broadbent is branch manager. The home office is in Salt Lake City, Utah.

Too Much Waist in Business?

American business and many American business men are carrying too much weight around the waist to function properly, according Edward N. Hurley, war chairman of the United States Shipping Board, and member of the Foreign Debt Funding Commission. Hurley's declaration is in the nature of a warning to American business men to trim down to fighting weight to meet the growing vigor of foreign competition.

"American business has been so prosperous and self-satisfied, that we have grown fat and are out of condition for a real fight," Hurley says. "On the other hand, European business has had to fight every inch of the way for the past few years. The result is that our European competitors are in better condition for the fight than we are."

ROYAL MAIL
The Comfort Route

PASSENGER AND FREIGHT SERVICE

Cabin Steamers to EUROPE

THE MODERN TREND IN TRAVEL—

The comfortable, well appointed cabin liner with its moderate priced accommodations—40% less than on express steamers—has opened a new era in European travel. People of moderate means, who have hesitated to visit the Old World because of expense, today are traveling by cabin liners.

To meet the ever increasing demand for this economical and agreeable transatlantic service, the Royal Mail now has four famous "O" steamers, the OHIO, ORCA, ORDUNA, ORBITA—a luxurious cabin liner fleet. Each of these splendid ships is noted for its delightful atmosphere, spacious cabins, broad promenade decks and excellent cuisine. An unsurpassed service at moderate cost, with sailings from New York to

CHERBOURG SOUTHAMPTON HAMBURG
PLYMOUTH BELFAST GREENOCK

PACIFIC LINE

Regular sailings from NEW YORK to SOUTH AMERICA (West Coast) via HAVANA and PANAMA CANAL. *Popular Steamers "EBRO" and "ESSEQUIBO" carry only first and third class passengers.*

Are You "Behind the Times"?

Not many years ago your grandfather reaped his crops—picked his cotton — dug canals and loaded his ships by hand. He also shoveled coal on his fire and hauled out ashes.

Today — you have advanced. You have machinery to do the work your grandfather did by hand. But—do you still shovel coal and haul out ashes? In Chicago today—Manufacturers are keeping abreast of the tide of industrial advancement and *improving* their products, simply because they know that—

If it's done with heat—

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

DOUGLAS FIR SOUGHT ABROAD

Other Good Markets Open to American Manufacturers

DOUGLAS fir for freight-car sides, in quantities of from 300,000 to 400,000 feet per month, is sought this week by an English manufacturer.

This is one of many foreign trade openings, confidential information concerning which may be obtained by addressing MANUFACTURERS NEWS, giving the serial number of the item regarding which data is desired.

Among the other items on file this week are requests from Trinidad and Newfoundland for steel rails, from Australia for 30,000 pounds of Alaska salmon, from Mexico for theater seats, amusement devices and oak, cedar and walnut in carload lots, and from Greece for bullock, cow, veal and buffalo hides. The complete list follows:

AUSTRALIA—
10135: Canned salmon, red Alaska, 30,000 pounds.
10155: Phosphorous amorphous and chlorate of potash in large quantities.
10118: Supplies and sundries suitable for woollen and knitting mills. Knitting machinery for hosiery manufacture. Textile industry machinery. Yarn of cotton and artificial silk for hosiery.
AUSTRIA—
10127: Cotton for surgical purposes.
10178: Crude and gas oil. Oils, lubricating. Paraffin.
10106: Shoes and snow boots, rubber. Shoes for men, women, and children.
10105: Shoes for men and women.
10107: Shoes for men.
BELGUIM—
10179: Galvanizing machinery. Machinery for manufacturing containers from steel sheets.
CANADA—
10189: Ice-making machinery, electrically operated.
CANARY ISLANDS—
10102: Heaters and ranges, kerosene.
COLOMBIA—
10093: Hardware, carpenters.
CUBA—
10161: Telephone instruments, coin boxes and dry batteries.
DENMARK—
10133: Yarn, artificial silk, mercerized cotton and combed cotton for making hosiery.
ENGLAND—
10164: Douglas fir in lengths of 12 to 17 feet for freight car sidings, 300,000 to 400,000 feet per month.
10132: Hats, all kinds, for women.
FINLAND—
10192: Marine motors, 700 to 1,500 horsepower.
FRANCE—
10086: Hydropathic instruments.
10095: Machinery for making gold pen points. Pen points, gold.
GERMANY—
10134: Butter.
10117: Gas masks, industrial. Airplane hangars.
GREECE—
10193: Hides—bullock, cow, veal, and buffalo.
INDIA—
10089: Books, periodicals, and stationery.
ITALY—
10186: Coffee mills.
IRELAND—
10188: Refrigerator, self-contained, detached type.
JAVA—
10148: Canned salmon and sardines, cheap grades.
10162: Electrical goods, especially wiring supplies and line devices.
10185: Match-making equipment, complete.
10171: Pipe, galvanized iron.
LATVIA—
10185: Sugar mill machinery and equipment for handling 500 tons of beets daily.
LITHUANIA—
10195: Box calf, all colors, of finest and medium grades.
MEXICO—
10087: Amusement devices such as merry-go-rounds and roller coaster.
10166: Glass bottles, 21-ounce, amber colored. Iron sheets, galvanized. Oils—vegetable and tallow. Oak, cedar, and walnut for making furniture, in carload lots. Paper, kraft. Sulphur. Wire, barbed. Wheat.
10180: Paper and pasteboard-making machinery.
10129: Sacks, cotton, for flour.
NETHERLANDS—
10088: Office supplies including drawing utensils, stationery, paper clips, and tacks.
10190: Automobile sundries, tools, garage supplies, and chassis and body equipment.
NEWFOUNDLAND—
10175: Rails, tramway, 20 tons.
NEW ZEALAND—
10182: Belting. Woodworking machinery and tools and equipment for mills.
PALESTINE—
10168: Black and galvanized iron sheets. Iron, round.
10169: Pipe, 2,600 meters, and valves and fittings. Pipe cutting and threading machinery.
10165: Fir, white or balsam, and Southern yellow pine and fir.
PERSIA—
10152: Drugs. Drygoods. Yarn and mercerized thread.
POLAND—
10182: Wood-working machinery and veneer-making machinery
SCOTLAND—
10172: Bolts of various kinds. Files. Rasps. Woods screws.
SOUTH AFRICA—
10094: Hardware specialties.
STRAITS SETTLEMENTS—
10187: Ice-making machinery, medium sized.
SWITZERLAND—
10090: Beads, glass, Bohemia.
10196: Druggists' and surgical rubber goods.
TRINIDAD—
10159: Rails, railway, complete with fish plates and tie rods.
VENEZUELA—
10131: Underwear, athletic style, twopiece, for men.

Sugar Factory for Canada

Erection of the first beet sugar factory in Western Canada will soon be undertaken near Raymond, Atla., according to an announcement by the Utah-Idaho Sugar Company.

Good Market for Safes

There appears to be a splendid opportunity for American manufacturers of bank vaults to develop sales in Hongkong and in the South China market, which is supplied through Hongkong.

What Are You Looking For From a Printer and Binder?

Equipment The necessary modern efficient machinery and buildings to economically and speedily produce the printing and binding required.

Personnel An organization of thoroughly trained men and women to operate the plant and deliver according to agreement, both as to time and quality.

Experience Forty-six years of active continuous operation under the same name and management.

Our advice is to place your printing and binding with a firm that you know has these qualifications.

Your inquiries will be given our utmost care and attention.

MANY manufacturers starting up business on a small scale find it advantageous to install some of our used (Rebuilt) Electric Motors and Generators.

Many large manufacturers operating hundreds of motors also install our used (Rebuilt) motors because they are every bit as *good as new,* will do the same work, and show a big saving in cost.

GREGORY REBUILT

motors have been overhauled—and inside—outerhauled—the *Gregory way*—they are free from faults and fully tested and practically new. They are always a good buy and sold with a satisfactory "Your money back" guarantee.

Send for our MONTHLY BARGAIN SHEET, showing complete stock and net prices—America's headquarters for Rebuilt Electrical Machinery since 1893.

plished through the medium of functional foremanship. Each functional foreman is an export teacher in his specialty.

(4) *The Assumption by the Management Itself of its Due Share in the Above-mentioned Three Divisions.*

14. Recognition of Management Science.

Recognition of management science as a distinct field is testified by the growth of the Taylor Society. This society was originally organized under the name of the Society to Promote the Science of Management, but changed its name in honor of Dr. Frederick W. Taylor after his death.

The Taylor Society through its national meetings, its meetings of local sections, and its bulletins has encouraged the development and appointment of executives of the thinking, investigating and planning type who survey conditions and tendencies, formulate precise plans, establish schedules and budgets, keep departments coordinated, maintains precise control of operation; have regard for efficiency and economy of methods and all the time appraises progress and results in terms in plans. The society has consistently endeavored to apply scientific and professional methods and viewpoints not only to production problems but to finance and marketing.

Another organization for studying management is the American Management Association. The association is an outgrowth of a merger of two older associations, namely, the National Personnel Association (originally the National Association for Corporation Training), and the Industrial Relations Association of America. The American Management Association recognizes that human problems principally expressed in terms of selection, training and development constitute the major portion of office management, sales management and general management. Hence the staff personnel executive needs a basic knowledge of management in addition to a knowledge of the technique of personnel work—conversely the line executive needs a knowledge of the principles, policies and methods of personnel work.

In changing the name from the National Personnel Association to the American Management Association the directors state, "It seems that the time has now come to broaden our title to include management in commerce and industry," with an explanatory limitation that its activities shall be non-engineering—that is, confined to the consideration of the human factor in commerce and industry.

In addition to the organization mentioned the management section of the American Society of Mechanical Engineers has done and continues to do effective work in the promotion of a knowledge of the principles and development of management science. It should be borne in mind that it was this society which furnished the forum for presentation and discussion of the work of Towne, Taylor, Gantt, Halsey, Emerson, Gilbreth and other men whose names are well known as management authorities.

FOR
RENT

Six-story and basement brick building of concrete and steel construction for manufacturing and storage purposes.

Dimensions, 41 ft. by 90 ft. or approximately 26,000 sq. feet. Location about 10 minutes walk northwest of loop.

Ideally situated with reference to the various freight stations. Ready for occupancy May 1st.

Heat furnished if desired.

Magic Yellowstone!

Its mammoth terraces, mighty geysers, boiling pools, mud volcanoes and other hot water manifestations; its gorgeous Canyon and Great Fall, its whole mountain grandeur; its recreational facilities—stand unchallenged among the world's summer vacation lands.

You can't make Yellowstone relative because there is no standard of comparison. No imagination can picture it.

You'll just have to see it!

Via two widely divergent routes the BURLINGTON operates through trains and through cars direct to the Park gateways. The most-for-the-money way is to enter at Gardiner and leave over the famous Cody Road—the most scenic 90 miles in America. Then you can travel via Scenic Colorado—no extra transportation cost if your ticket reads "Burlington."

Let me explain how well Burlington Service may be utilized on any western tour, and provide you with interesting booklets about vacations in Yellowstone and elsewhere in the west.

Clothes washed by Thor last longer

Thor laundered clothes wear longer and appear fresher. When washed in dubious surroundings and handled by uninterested strangers they do not receive the care which gives them long life. A Thor in the home saves you many dollars and your wife many hours. It keeps your clothing free from contact with other washings and does away with expensive replacements of lost garments. Thor launders for you quickly, economically and efficiently. See it in operation today—you'll understand its superiority.

BUILDING ECONOMY *and* ATLAS

THE need for home construction is evident in every community. Oddly, it is the impermanent home, the one generally considered cheapest, whose cost has risen most. The prospective homeowner can better afford to build permanently today than ever before.

For instance, a house of concrete blocks, covered with stucco made with ATLAS White, costs in the beginning only from 2 per cent to 5 per cent more than one of less permanent materials. In a few years, because of saving in upkeep, it will have actually cost less. Such a house is fireproof, permanent and free from annoying repairs or painting bills. Its beauty is an additional feature, costing nothing.

Such construction is also rapid. The contractor who encourages this type of building is benefiting the homeowner by safeguarding his investment, benefiting the community by raising its standard of homes, and benefiting himself by increasing the number of homes he can build. A man's home deserves to be built of ATLAS—"the Standard by which all other makes are measured."

A large assortment of informative literature, covering practically every phase of concrete construction, is available to contractors or others interested in building. The ATLAS *Service and Technical Department also will gladly furnish any special information on concrete construction or the cement industry.*

THE
G. A. R. BUTTON

ONLY a little bronze button, worn with a modest mein,
But bearing a greater honor than gifts of King or Queen:
For the wearer shares the glory of Him who died on the tree,
For he offered his life also that all the world be free.
And what there is of glory on fields of blood and strife,
Is his, for he won it nobly in war for a Nation's life.
And his deeds shall live in story as long as the earth shall stand,
For he wiped from our starry banner the curse that covered the land;
And he made "Old Glory" spotless, as spotless as stars above,
Without thought of pay or glory, a hero for duty and love.
Though he's old and gray and wrinkled, and filled with many a sin,
The heavenly gates are open to gladly welcome him in.
For there on the "Rolls of the Blessed," where our deeds and our acts
  are laid bare,
His name has been written by angels, their peace and their glory to
  share.
So when you see that small button, though it hangs on a ragged coat,
Lift your hat in reverence to it—the wearer your history wrote
In deeds the brave of the bravest, in acts unselfish and grand,
That you and your children's children might live in a freeman's land.

"THE G. A. R. BUTTON" was written more than a decade ago by the late WILLIAM BRADFORD MAIN, a member of the first board of directors of the Illinois Manufacturers' Association, who served through the Civil War with the Thirteenth Illinois Volunteer Cavalry.

THE STUDY GROUP

Fourth Article on Training Factory Foremen

By J. K. NOVINS

All Rights Reserved

IN most manufacturing plants no systematic foreman training is given, yet it cannot be said that the foremen there do not receive some sort or form of instruction. The foreman's daily contact with other executive officers. of the plant usually results in con- t interchange of valuable information. The foremen meet in rooms for social purposes; they gather to listen to lectures other executive officers or by outside speakers of prominence. shop paper in many cases has proven a good influence.

he management recognizes the advantages of such contact, and re foreman training courses have been instituted the social tact factor is in no wise neglected. Rather, it is encouraged, sometimes the systematized training course serves as an effec- adjunct.

sually the foremen's club meeting is of a semi-social nature. s attended by foremen, sub-foremen, superintendents, and by er major and minor shop executives. Perhaps the foremen ng their wives and sons. The employment manager generally anges for a lecture by an authority on a subject of special rest to the foremen. The meeting may be held weekly or nthly. It is usually well attended.

n the larger plant there is the factory council which, as a rule, ets once a week, and sometimes oftener, during the working urs, to discuss company policies. The factory council is usually nposed of the general foreman, foremen and assistant foremen, erintendent, employment manager and other department heads, luding the sales manager. In some plants it is a standing rule t the head of each department represented at the council be en an opportunity to act as chairman of the council. The tory council discusses policies and even makes definite recommendations to the management. By interchanging information l viewpoints, the foremen learn from the sales manager, the es manager gets the foreman's viewpoint, and so down the line. whole scheme is conducive to a broader understanding of the tory policies and conditions by the various executives.

The shop committee and the works council movement has also ntributed its share toward a broader understanding of the execu- functions of the foreman. In the governmental type of demo- tic management of the factory the foreman is usually a member the Senate, or upper house, which as a rule passes on management policies discussed and proposed by the lower house, or rkers' governmental body. According to a report by the tional Industrial Conference Board, the works council idea s introduced in two hundred plants during the war, affecting half million workmen. In its report the Board says:

"Works council is intended as one means of satisfying the desire the worker for a share in the adjustment of his work conditions; a means of lessening labor difficulties, of allaying industrial rest, of increasing production efficiency; and is an opportunity informing employes in production, technical and economic estions."

Effective as these schemes have been, they have not met a real ucational need, at least as far as the foreman is concerned. While desirable in all other respects, especially in fostering the "get-together spirit," there is no definite educational aim, the foremen are not learning fundamentals, and the plan management is not availing itself of the opportunity to afford the executives a deeper understanding of the problems taken up at such meetings.

These educational advantages are not to be found in the average small plant employing only one or a half dozen foremen. How shall these men study? Well, there are the various industrial and technical schools and colleges, located in industrial centers, some of which offer special educational facilities for the foreman-student. It has been only recently that such courses were inaugurated. We can name such institutions as the Carnegie Institute of Technology at Pittsburgh, and the Lowell Institute of the Massachusetts Institute of Technology. Without minimizing the importance of these educational institutions, it must be admitted that very seldom are the foreman-courses there really adapted to the diverse needs of the foreman, and very often instruction is largely theoretical.

It is to be expected that these very same institutions will yet make wonderful progress in this field of industrial education. The University of Pennsylvania, located in an important industrial district, recently inaugurated a course of lectures for foremen in nearby industrial plants. Meetings were held in the auditorium of a city high school. Some 500 foremen, representing a variety of plants and industries, attended. They listened to a lecture. The class then broke up into small groups, each group composed of men having common executive interests. The groups adjourned to separate rooms in the building. They discussed the lecture and cleared up some of the mooted points introduced by the speaker of the evening. The men were prepared with facts, figures and individual experiences, for a week previous to the meeting the foremen had been supplied with mimeographed outlines of the subject to be discussed.

On the whole, these educational institutions have been chiefly successful in training prospective foremen, and the minor executives for the local manufacturing plants. In this way they are performing a definite service to industry.

Another medium for the instruction of foremen is the correspondence school. This institution offers a wide range of subjects, the foreman-student picking those that interest him most. The chief disadvantage of the correspondence school is that the foreman does not enjoy contact with the instructor. This deficiency has been overcome somehow by the practice of some correspondence schools which send trained instructors to the plant at stated intervals to meet the student in person and advise him on his individual problems. Many plant managements actually encourage the foreman to pursue a course of study with a correspondence school, defraying half, and even the whole of the tuition fee.

Another development is the standardized course of study introduced in the plant by an outside educational institution specializing in foreman-training. One such institution claims that it has

MACHINERY VS. MAN POWER

How Far Can Machinery and Better Use of Labor Supply Offset Immigration Restriction?

By L. D. H. WELD

Commercial Research Department, Swift and Company

THE United States has adopted a definite, drastic, probably permanent policy of immigration restriction. This step represents a radical and revolutionary change. The country has been built up and has become the richest nation in the world under a policy of unrestricted immigration, except so far as certain Asiatic countries are concerned. Now that our population has reached 110,000,000, we have decided that we can rely principally on natural increase of population for such growth as is necessary or desirable for the future.

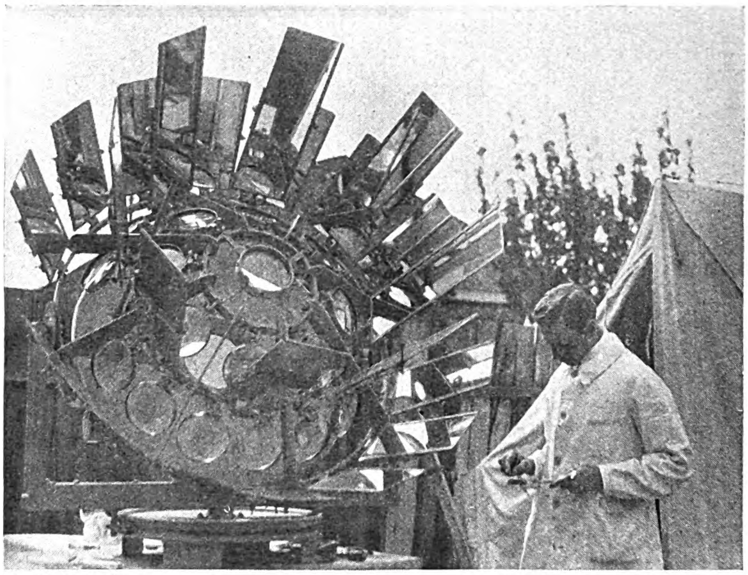
Before the European war, we often admitted over a million foreigners in a single year. The movement from Europe to America since 1900 has outstripped all human migrations in the history of the world. Our net increase of population due to immigration before the war was around half a million a year. If we go back far enough, our total population, exclusive of Indians, has been due to the annual influx of immigrants plus the offspring of former immigrants. During recent years our increase in population has been due very largely to the annual influx of immigrants plus the first generation of children of former immigrants. Now we are definitely limiting the growth of population from this source. The law that has been in force since 1921 limits the number of incoming aliens to about 350,000 a year. The bill under consideration in Congress at present limits to approximately 160,000 with most drastic cuts in the number of southern Europeans permitted.

Unless we make up for this smaller immigration through earlier marriages and larger families, the growth of population will be perceptibly retarded in the future. Estimating from past experience, we might expect 135,000,000 people by 1940, without restriction of immigration; the policy that we have now adopted will probably mean 10,000,000 less than that by 1940.

How will this policy affect our future development? To what extent can the smaller number of laborers be offset by utilization of our present supply of human beings, and by the introduction of new machines and processes? No definite answer can be given to this question, but it is worth while to consider some of the factors involved.

Because of our great natural resources, the productivity per man in the United States has been greater than in European countries. This has resulted in a higher scale of wages and in a higher standard of living than has existed in other countries. Things have been relatively easy for us and we have always been regarded as a wasteful nation. We have not had to bother with details, and our people have not been willing to go to the same pains to save a penny.

SUN-POWER



P. & A. Photo

"To what extent can the smaller number of laborers be offset by utilization of our present supply of human beings and by the introduction of new machines and processes?" While Dr. Weld was writing this article a California inventor was perfecting the above machine, which extracts sufficient heat from the sun to melt practically all substances. The highest temperature obtained is in the vicinity of 3,200° F.

We have come to the point where we must take stock. It is assumed that immigration restriction is going to act as a great incentive to increase production and keep down costs through better use of our present equipment. The first thought that comes to one's mind is that there is likely to be a great increase in the use of labor-saving machinery. But this is not the only way in which productivity can be increased, and possibly not the most important way.

The principal ways by which immigration restriction may be offset are as follows:

1. Better management.
2. Introduction of new machinery and processes.
3. Better use of labor supply.

The problem of increasing the productive capacity of our present physical and human equipment is largely one of elimination of waste. The committee on Elimination of Waste appointed by Herbert Hoover as president of the Federated American Engineering Societies, made a study of this problem in 1921. The report of this Committee has attracted a good deal of attention. It reported that management is more than 50 per cent responsible for the present waste in industry, and that labor bears less than 25 per cent of the responsibility. The Committee said that "in every industry there are outstanding examples of good management, but the bulk of industry doesn't approximate this standard." Some of the most important reasons for waste, as reported by this Committee, are as follows:

1. *Faulty control of material*—It was found that the loss from idleness in shoe-making, for example, occasioned by waiting for work and material, amounts to some 35 per cent of the time.

2. *Faulty control of designs*—There is great opportunity for standardization of mill work, window frames, doors, and other similar items in the construction of buildings. As an example of the disregard of standard size, it is reported that the Federal Reserve Bank check will not cut without waste from any of the regular paper sizes, and that a draft questionnaire, issued during the war, was of such non-standard size as to require special file cabinets. This matter of simplification and standardization is one on which the Fabricated Production Department of the United States Chamber of Commerce has been working with considerable success. There is little chance for progress of this kind in industries where the style element or the personal equation enter in an important way; but there is plenty of opportunity in other important industries.

3. *Faulty control of production*—This refers to the lack of effective planning and administration in the average manufacturing plant.

ATMOSPHERE—A BUSINESS ASSET

Furnishing the Office in Good Taste

By FRED E. KUNKEL

WHERE aesthetics and business blend there is inevitable "atmosphere," and if the "atmosphere" of business offices breathed the same spirit of stage management that David Wark Griffith achieved when he produced his screen classic, "Broken Blossoms," the average erican office would be a thing of beauty and a joy forever. The rd Chinese "atmosphere" incidental to the production of oken Blossoms" was brought out by decorating them with rry blossoms and using as ushers Chinese girls dressed in their ive costumes. Lighted joss sticks permeated the air with their fume and the orchestra played oriental selections. This setting idly reminded the audience of the local color of Chinatown. ere was inevitable "atmosphere."

Why should there not be more local color and "atmosphere" the business office? Why should a man who spends eight hours more every day in his office as against four or more in his home, t counting the time consumed in eating and sleeping, follow ndly the custom of furnishing his office like a jail warden's room d barbarously placard his walls with calendars or other inordin- propaganda, instead of creating an atmosphere of comfort and raction? This does not mean his office should degenerate into boudoir or be adorned like the foyer of a theatre or a hotel, or il in the necessary tools and furnishings of business, but it is a ticeable fact that certain business and professional men whose ices have almost the atmosphere of the libraries in their own mes, suffer little from fatigue, nervousness and strain. By the me token, there is no longer any reason why the business office ould be a noisy, turbulent place to work in rather than a quiet, lent, efficient room, for making the office noiseless is a compar- ively simple matter in this modern age with the use of noiseless pewriters and of sound-proof felt on walls and ceiling.

The offices of a large packing plant in Chicago and of the West- n Union Telegraph Company are virtually sound-proof where nce the employes were constantly interrupted by the din of voices nd office appliances. One of the most aggravating causes of efficiency has been removed in the stenographic pool of the nited States Chamber of Commerce at Washington where more an fifty stenographers are operating noiseless typewriters with quiet, silent efficiency.

After the walls have been rendered sound-proof they can be reated in the matter of color—painted to reflect light, and deco- ated as are business libraries, with drapes on the windows. Then omes the question of artificial lighting and last, but not least. he furniture. Executives and office employes alike must have the roper tools if they are to do their best work. Modern desks are lesigned to place everything at the finger tips of the worker, within lbow reach, without ever moving a chair. There are also many ppliances which save time, steps and labor. These must be known nd utilized if the office is to have unmistakable "atmosphere."

What principles should guide in the selection of the necessary ffice appliances and furniture? Many business executives are too usily engaged upon other tasks to have either time or inclination to decide the correct principles for equipping their offices or to learn the proper tools with which their office forces should work. A decade ago this question might not have been so important, as specialization in office furniture had not developed as it is today. Then a desk was a desk, a safe was a safe, and a file cabinet most anything available. The roll-top desk was in vogue, typewriters were put on tables and the bookkeeper sat on a high stool if he didn't stand up.

Today the manufacturer of office appliances and equipment places at your disposal from twenty to forty different styles of desks (including the modern roll-top), to meet individual preference and up-to-date efficiency, where everything is placed at your finger tips. In addition there are special purpose desks, such as card record tubs where everything is within easy reach of the operator without moving from the chair, each operator controlling as high as 10,000 index cards; there is the posting machine desk for those using bookkeeping machines; and the office safe is no longer a ponderous cast-iron receptacle but a light, commodious steel cabinet, fire-and-burglar proof. There are literally hundreds of useful office appliances which save time, labor and money. Yet, with all this variety, the average business office is still a stranger to the right type of furniture and tools.

The average American office may be said to be in a slow state of progress, a pragmatic state according to the inclinations of the individuals in charge. All offices are more or less autobiographical for that matter, and their manner of furnishing is often a clear indication of the persons who transact business there. Some of these offices are travesties on American business as it is conducted today, relics of a bygone day, while others reflect the personality of the modern progressive business men, and are beautiful manifestations of what those people really are.

In selecting office furniture the predominating tendency should be one of comfort and convenience, every piece definitely selected for the performance of a certain function. Economy does not mean a saving in price but a saving in the worker's time as well as in depreciation and floor-space. These are more important than the initial outlay because they are a larger liability over a period of years. Utility and length of service must be considered, while standardization cannot be lost sight of without loss of efficiency or lack of uniformity.

In every nine cases out of ten, office decorations are the gradual accumulation over a long period of time. Their owners believe in patchwork instead of creating a new office at one stroke, so they slowly acquire and discard, substituting for the silly, the futile and the ugly that which quickens the eye and comfortably accommodates the body, while saving steps and time. The trouble with some offices is that youth has gone out of them and senility crept in with dust and cobwebs. They are dusty with old traditions, old furniture, old books, and old methods which were good enough forty years ago but, like their owners, these indicia reflect old ideas which have not kept pace with this workaday world. They need some of the springtime of youth again, to make them new and bright.

Creating "atmosphere" in the business office is a matter of knowing how to create the effect that will impress visitor and worker alike, whether of wealth, of cleanliness, of dignity, or what not, and how to dodge eye-strain which comes from bad lighting and which is often removed by curtaining and an indirect lighting system. Hence the atmosphere of double drapes at the windows of modern successful business offices, carefully chosen rugs and carpetings or linoleum, private rooms for the brain-working executive, the creative man whose thoughts must be protected from untimely interruption, desks and cabinets of utility—capable of expansion, the chaste green of metal, clean, dignified and commanding, with fitness, simplicity and efficiency everywhere. It is the tone of such an office that creates "atmosphere," begets confidence and builds business.

Certain it is that the walls of the office and the furniture about us should be more than mere stage sets before which we make the gestures of business living, for the business office can be and is being decorated and stage-managed into an environment where furniture and color harmonize to produce a pleasing setting. Many business men are beginning to understand the elements of decoration and decorating their offices so skillfully that they actually give the impression of being lived in, while all the illusions

Continued on Page 23

THE PASSING OF THE BONUS

The Week's Doings in Washington

By JOHN M. TOWNSEND

Special Correspondent, MANUFACTURERS NEWS

THE Senate, by a vote of 59 to 26, this week overrode President Coolidge's veto of the soldier bonus bill. The measure becomes law automatically, the House, last Saturday, having also refused to uphold the Chief Executive's veto.

The immediate result of the passage of the bonus is this, that, with expenditures now definitely in prospect, conferees in the Senate and House on the tax bill are faced with the necessity of so adjusting that bill as to avoid a large deficit.

The Senate Bill has been estimated to cause a deficit of at least $120,000,000, not including the cost of the bonus. The tax bill as passed by the House was estimated to cause a deficit for 1925 in excess of $50,000,000, not including the cost of the bonus. Adding the bonus expenditures, the deficit would be in the neighborhood of an estimated $200,000,000.

There are, according to those somewhat optimistically inclined, sufficient disputed sections of the tax bill to permit the conferees, *if they will*, to reduce the threatened deficit under the Senate Bill by as much as $100,000,000.

However, if the tax bill, as finally sent to the White House, points to a deficit of about $50,000,000 for the fiscal year 1925, not counting the bonus, it would mean a total deficit of $200,000,000, and it is considered quite possible that this will approximate the situation.

Under ordinary circumstances, President Coolidge's smashing veto of the bonus bill would have fallen upon the ears of a Congress interested primarily in the general welfare. It is necessary to emphasize at this time that this Congress is not that kind of a Congress. It is a disrupted, disorganized body of men who are in a political panic in which each member is looking after what he believes to be his own political interests, first, last, and all the time. Congress has picked out the World War veteran and the farmer, and perhaps the railroad employe, representing three large bodies of votes, as factors which should receive special treatment with an eye to the elections next fall. The President alone is thinking of the country at large.

BURNS

The resignation of William J. Burns, world-famous detective, from the United States Department of Justice, furnished one of the sensations of the past fortnight. Mr. Burns's resignation was tendered Attorney-General Stone "effective immediately." In retiring, Mr. Burns stated that he did so for reasons of personal business and that he left the Bureau of Investigation at what he believed to be a high and enviable point of efficiency.

CHAOS

If anyone had predicted after the great Harding victory of four years ago that twelve republican Senators from New England would have voted to override a presidential veto to protect the treasury from an admitted raid for the benefit of a few persons, that president being a distinguished New England man, he would have been set down among serious thinking men as a fool or an idiot. Yet that is exactly what happened when the President's veto of the Bursum civil war pension bill was sustained this week by the narrow margin of a single vote. Even Senators Henry Cabot Lodge, and Brandegee and McLean, of Connecticut, turned down personal requests from the President to support the veto. Senator Lodge's record in this respect is understandable—it is consistent in that he has yet to support anything the President wants. It is not so understandable with respect to the eighteen so-called regular republicans who voted against the President, and the country alone benefited by the fact that it was the bulk of the democratic leadership who voted to sustain the President, aided by a corporal's guard of republicans, of whom Senator Harreld, of far-off Oklahoma, was the star performer when he changed his vote at the last minute and saved the day for the President and, incidentally, $58,000,000 for the taxpayers.

So far as a large majority of both houses was concerned, the courageous veto message of the President on the soldier bonus bill was tantamount to firing a sixteen-inch gun 200 feet underground. It fell on ears so stuffed with political promises of long standing as to infuriate rather than convince men who knew what the public welfare demanded, but whose word was out in a manner which could not be rescinded. It is safe to say that the President's veto of the bonus bill will be remembered in history long after those who voted to override it will be forgotten, but it is not unlikely that the logic of events in this session of Congress as presaged by this vote message, will cause the bonus advocates many an unhappy hour in this year's elections.

Last December the President told Congress and the country that the treasury could not stand tax reduction and a soldiers' bonus simultaneously, and that he, substantially, favored tax reduction first, on the ground that it would yield the greatest benefit to the greatest number, not only immediately but through its permanent effect on the high cost of living. If the bonus veto means anything, it means that, having been overridden by the House and Senate, the President cannot sign the pending tax bill because there will not be money enough in the treasury to pay for both.

In his bonus message, the President laid special stress on the gratuity it contains to a comparatively small number of beneficiaries as compared with the benefit which would come to the whole country from tax reduction.

There is every indication that the President must take the same stand if Congress insists on passing the McNary-Haugen agricultural relief bill, for the exclusive benefit of the farmers, at an expense of $200,000,000 to the taxpayers of the whole country. Today there is in Washington a tremendous lobby insisting on the passage of this bill. In the past, Congress has turned down many a similar bill on the ground that it was class legislation of a paternalistic character, but this year, rank as the bill is in its violation of good principles of government and finance, it is likely to be voted up because the farmers have votes for which every party in Congress is bidding. There is, however, no certainty that this measure can be passed over a presidential veto.

Beneath the surface, the contest in Congress to override the presidential veto was bitter in the extreme. There was no such thing as a regular republican organization in either house to defend the president. On the contrary, democrats, progressives, and even some of the regular republicans ran around to solicit votes to override the veto in a manner bordering on plain hysteria. The casual onlooker could easily believe in looking at the scene that there was a war of some kind on between the executive and legislative departments. So far as Congress is concerned, this is the fact. Congress has done little else but make war on the executive

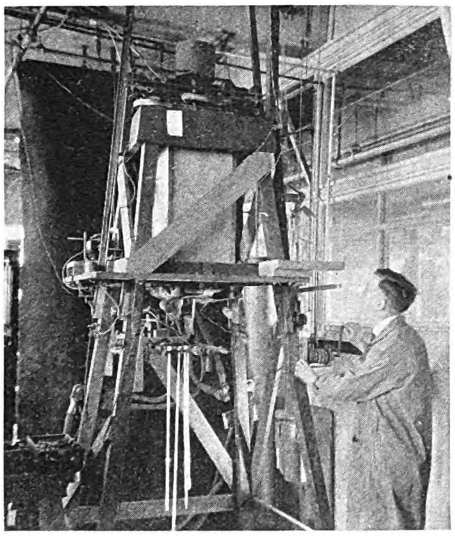
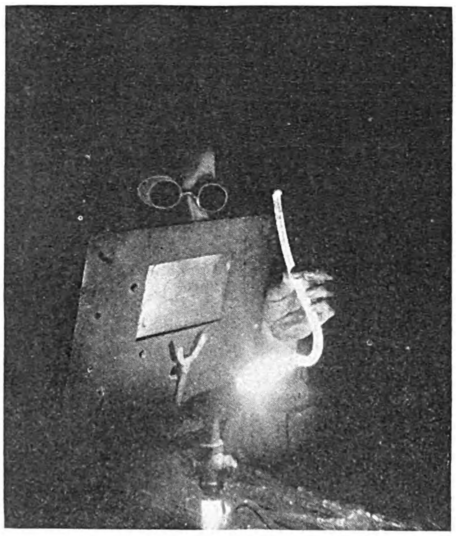
CLEAR FUSED QUARTZ

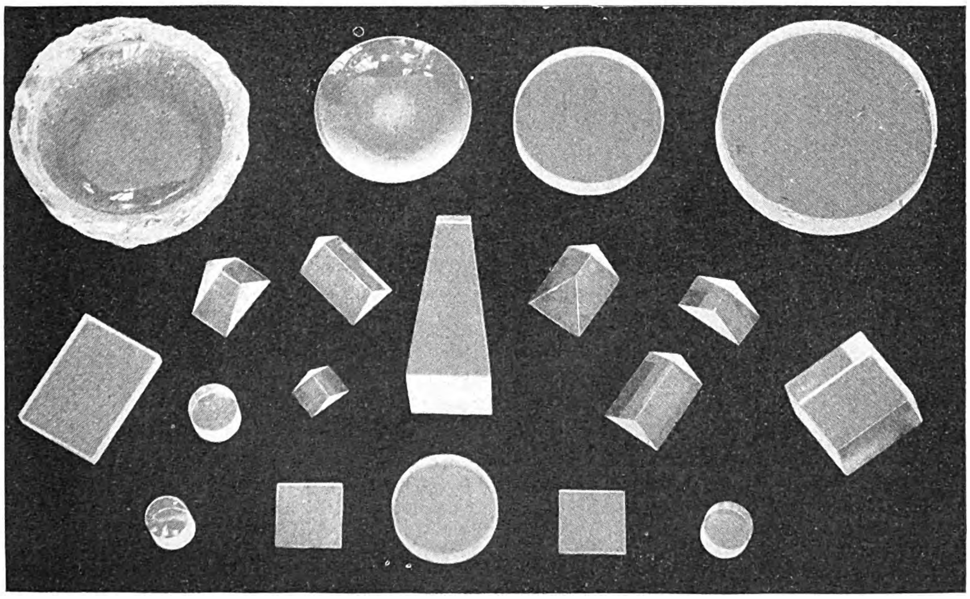
A New Manufacturing Substance of Which Great Things are Hoped

A NEW aid to men of science which may develop into one of the most signal contributions of the century is clear fused quartz. According to Edward R. Berry, assistant director of the Thomson Research Laboratory of the General Electric Company, clear fused can now be produced on a commercial basis, in sizes and ities heretofore impossible of achievement.

bably the two most important properties of this substance first, its ability ansmit wave- ns which cover a range in the um, ranging the infra-red or t rays, through arious colors vis- o the human eye on down to those er wave-lengths n as ultra-violet, ible, but health- ng; and second, xtremely low co- ent of thermal ex- sion.







ecause of its abil- o transmit visible d invisible rays, nd curves if nec- ry and with little , this material, it aid, will be of nt benefit in thera- tics. Because of low co-efficient of rmal expansion, cision apparatus, e tools with which nce works, will be reased in accuracy d utilized in new ys which will add the sum total of nan knowledge.

In using the micro- pe for examining l structure in bio- gical work, it is ten necessary to in the slides in or- r to bring out the ll's construction. metimes the proc- s of staining changes the actual character of the cell, certainly injects an element foreign to its nature. Using a clear fused artz lens, and ultra-violet light, a photograph can be taken of e cell-photographic plates being affected by ultra-violet although is invisible to the human eye. It is quite possible that the result- t knowledge of cell tissue will be new and valuable, perhaps artling.

The standard of length, housed in the Bureau of Standards, is meter bar, with two studs inserted marking off the international nit of measurement, 100 centimeters. Great precautions are taken keep this standard of length at constant temperature. A rod fused quartz one meter long will expand about six-tenths of a millimeter for a temperature increase of 1,000 degrees Centigrade. This remarkably low co-efficient of thermal expansion may also be utilized in the construction of pendulums of clocks, where a change in length must be compensated.

A thermometer made from quartz is not subject to the appreciable "lag" known to exist in glass thermometers. When a mercury-in-glass thermometer and a mercury-in-quartz thermometer were placed in a bath of melting ice (zero degrees Centigrade) and the temperature raised to 515 degrees Centigrade, then slowly lowered to zero, the glass instrument read four degrees below zero while the quartz instrument read zero exactly. Clinical thermometers are also subject to this discrepancy, and where a difference of a half-degree is of incalculable value to the physician, quartz may well replace ordinary glass.

Clear fused quartz may find a field of usefulness in the musical world. A tuning fork made from this material does not change its pitch with temperature changes. It may be corrected in manufacture without having its pitch appreciably affected by an increase of temperature due to grinding or otherwise working the material, as is the case with metallic forks.

For therapeutic treatments quartz seems to offer valuable contributions. It is possible to localize and direct rays of ultra-violet light by the use of a quartz rod. This rod being curved into the necessary shape the light is transmitted into the body cavities which have hitherto been inaccessible or difficult of access. Ultra-violet light, produced by a mercury vapor lamp also constructed of quartz, is used as the source of the rays.

Water is sterilized when subject to these rays. Due to the absorption by the atmosphere, comparatively few ultra-violet rays from the sun reach the earth. It is now possible to obtain and direct ultra-violet light from quartz mercury vapor lamps, and to send it around corners.

Since the image of a star is always a point on the axis of a lens, the axial aberration is of chief importance in astronomical work.

TAX-RIDDEN

MANUFACTURERS of Illinois, led by the Illinois Manufacturers' Association, have done effective work in Washington in the interest of tax-reduction. They have also effectively presented organized opposition to the Howell-Barkley railroad labor bill which, if enacted into law would inevitably lead to higher freight rates.

Efforts of an Illinois Manufacturers' Association committee and the energetic work of the Associated Industries of Massachusetts had considerable to do with the unfavorable attitude of the House of Representatives on the railroad labor bill when it came up on May 19.

Why are manufacturers so particularly interested in these measures? *Because they pay a large per cent of the taxes and a large share of the freight rates.*

The farmer complains of high taxes and high freight rates and he has a right to complain. The manufacturers get less sympathy because many people think the average manufacturer is rolling in riches. As a matter of fact, the tax-ridden average manufacturer frequently lies awake at night with payroll worries.

The manufacturing establishments of the United States paid 34.9 per cent of all income and profit taxes collected in 1920 according to Nathan B. Williams, associate counsel of the National Association of Manufacturers. The net income of manufacturing establishments for 1920 after deducting the taxes paid was 4.12 per cent. The net income of manufacturing corporations for 1921, after deducting the taxes paid was minus 1.23 per cent—a shrinkage of 5.35 per cent in a single year.

THE LABOR VOTE

ORGANIZED labor cannot and never could deliver the so-called labor vote. Working men are independent. They think for themselves.

Latest efforts made by the railroad brotherhood overlords to intimidate members of Congress have been in connection with the Howell-Barkley bill to abolish the railroad labor board. This is a bill to turn the railroads over to the brotherhoods. The public will be left without representation; strikes will be invited if it is enacted into law. Freight rates will be increased.

Congressmen and Senators who are intimidated by the brotherhoods in this instance might, with advantage, recall the attempt made by the American Federation of Labor in 1922, to defeat those who voted for the Esch-Cummins Transportation Bill. The attempt was a failure as pointed out by Frank X. Noxon, of the Railway Business Men's Association.

Two hundred and nine members of Congress who voted for the bill ran for another term and only fourteen or six per cent of them were defeated. Of those who voted against the Esch-Cummins bill, 128 ran another term and forty-six were defeated, or thirty-six per cent.

WAIT!

Wait! You May Lose. Cross Crossings Cautiously

THIS is the slogan which, with an fective poster design, won a $600 i prize offered by the American Railw Association. Millions of the posters a stickers reproducing the design in miniatu will be distributed during the coming s son by the railroads.

It is time for the American publ especially the millions who use auto biles, to slow down. An average of f persons a day are killed at railroad gra crossings, mostly because the drivers are i too much of a hurry.

Some drivers may think they can pu a train off the track but as an avera limited of ten Pullmans and a locomotiv weighs 2,014,200 pounds and going at rate of sixty miles an hour would strike blow of 245,056,715 footpounds, it is discretion to avoid such an encounter.

Don't hurry. Slow down. Put on the brakes. Stop, look and listen when approaching a railroad crossing. Don't g hurt.

CONGRESS

WHAT'S the matter with Congress? From one end of the country to the other, the cry is growing. *What's* the matter with Congress? What *is* the matter?

It is no longer only "big business" that is demanding the answer. The general public—the working man, the housewife, the salesman and the clerk, all are beginning to realize that something is *wrong*.

The whisper is going the rounds that "bad times are coming." No one knows why, nor how, nor when—but what's the matter with Congress? Something's wrong. Watch out.

That's the sort of thing that breeds panic. Every analyst knows that there is no reason for panic or distress—economically. The country is sound. Money is plentiful. Business is good.

But Congress is greasing the skids. A couple more "bonehead plays" will serve to set the nation on the toboggan. Congress must know it—but Congress doesn't seem to care.

That's what's wrong with Congress. It doesn't care what happens to the country as a whole. It "hasn't time." "Our representatives" are too much wrapped up in serving "their" constituents to serve the country's welfare.

Too much sectionalism; not enough Americanism—*that's* what's wrong.

PACIFISM

IT is a principle of Americanism and of American government that every man is entitled to his own opinion and to a reasonable expression thereof.

MANUFACTURERS NEWS does not believe in the theory of absolute and unconditional

$500,000,000 LOST SALES*

By ROY DICKINSON

Associate Editor, Printers' Ink

NO stingier man exists than the one who has lost $20 the night before at poker. Let his wife come to him with plans for a new hat, or Sanitas to fix up the front hall where the children have put their dirty fingers, or even with ideas for a set of Fuller brushes for the and she will find him cold as any stone. With the memory loss fresh in his mind and the money gone from his pockets, definitely out of the market even so far as the baby's new are concerned. As a prospect for the first payment on a new kitchen cabinet he is worthless.

en my Uncle Peter lost $1,000 in a fake oil well he didn't ıe tractor for the farm. The house and barn didn't get a oat of paint that year either. Sherwin & Williams never where that lost sale went, but I could have told them. It nto the pockets of a flashy individual in a swell sedan who a distant oil well look like ready money. When he disap- l from sight he left a nice-looking certificate in exchange oney Uncle Peter would have invested in advertised products ear. He sold blue sky and you manufacturers lost sales.

ltiply the man who lost $20 at poker and temporarily was the market for necessary products by 5,000,000, or multi- y Uncle Peter by 500,000 and we have a really tremendous em which is affecting the manufacturer of every advertised ct from gas ranges and waffle irons to furnaces, tractors and That 5,000,000 people would make a big parade. Even 00 people, who each threw away $1,000, would worry the facturer if they kept marching past the stores where his prod- vere on display and never stepped inside. For a half-billion ollars were gathered in by get-rich-quick promoters during This is one of the low estimates, issued by the Treasury rtment. Some other estimates run to twice this figure.

m going to take the lowest estimate, that put out by the con- ive Treasury Department, to point to a situation which I requires the immediate attention of manufacturers who ad- e, advertising agents, publishers and all men interested in ıle of goods and services. When Secretary Mellon issued tatement in the form of a booklet entitled "How to Save Your gs" he said: "The pitiful fact is that these millions have wrung from those who can least afford to lose them; from eople, small shop owners, small farmers, workers and la- s, whose savings, won by hard work and sacrifice, have been away and lost to them forever." In other words, this tre- ous loss in which hard-earned cash was turned into certifi- worth only the paper they were printed on, came from our urchasing power classes, the farmer and the wage earner, great part of this money was taken right away from the ledgers of you manufacturers who are selling advertised -marked merchandise. It's from your profits this money is A half-billion dollars of lost sales!

en look at the report of the McKenna Committee of repara- experts. It shows that of the total of $2,000,000,000 of loss to the purchase of marks by people outside Germany, it is ıated by other experts that a full half came out of American ets. Truly we are a nation of economic and financial illiter- The situation offers a real challenge to the selling brains merican industry.

ıe man who has been stuck by a get-rich-quick promoter sell- wamp lands instead of real estate and phoney certificates in- l of investments; who has bought marks instead of bonds, is ired to pay his rent, his gas bill, his doctor's bill, and the necessaries of the family budget. The thing he does not is the vacuum cleaner his wife needs to make her work easier, ıe new davenport for the living-room. He lets another year go by before he puts a new coat of paint on the house or asbestos shingles on the barn. The thing that faces us is a definite, preventable waste in purchasing power which is putting money, which should be put into productive industry, into the hands of an unscrupulous bunch of harpies who should be behind bars. I want all of you manufacturers, publishers, agencies, and the rest to do something about it.

I realize fully that a great deal is being done and being done well. Publishers have probably done more than any one group to help check this orgy of wastefulness, this stealing of money which should be going into better living conditions, which should be keeping factory wheels turning and other men employed in useful labor. I have been examining a great many of the questions-and-answers columns of various newspapers, magazines, farm papers and the like, and have found much of value in them. From the publications I have looked over, the present good works seems to be taking two definite forms. One group of publications, for example, runs a series of good, sound articles on finance which take up the history of a certain security, or the equity behind good securities, telling the investor how he or she can differentiate between the good and the bad.

In one periodical I have seen, a recent article deals with a new organization whose plan it is to make available to all bank depositors complete information from their bank regarding securities. A similar article in another publication takes the form of an advisory discussion. It analyzes various types of securities and gives the reader some fundamental facts about safe methods of investments. Other periodicals operate a regular financial department in which the individual investor with $5,000 more or less, is given specific and definite information about certain stocks or bonds which he is considering. Without fear or favor the propositions put up by stock salesmen and others to the individual investor, who in turn goes to his publication for advice, are answered fully, frankly and in the greatest detail by the man who runs the department. Publications running either kind of department are extremely careful about the type of advertising they accept and carefully exclude from their pages questionable flotations.

Newspapers and periodicals which run either articles on finance or a definite readers' guide to answer in detail questions put up to them, are doing an extremely valuable service, not only for their readers, but for the manufacturers of America. I remember reading in one such department of a widow who had received $48,000 in life insurance. She asked whether she should invest a third of it in a stock which had been highly recommended to her by a friend. She had been told it was safe and that it had in addition great speculative possibilities. The editor of the financial department of this paper advised strongly aganist the stock and told why. He suggested in its place investment in a list of well-secured bonds which he described in detail. Now this man, in addition to the great humanitarian service in saving a widow from want and suffering and total loss of her money, also did a great thing for a whole group of manufacturers who may never have realized the extent of his service.

He sold a Ruud heater for the widow's house, a set of Cutex materials, new rugs for the floor, and a whole flock of other items which in the years to come will go into her home because her money is being saved to produce dividends instead of being given over now to a crook.

A man writes to another publication that he is fifty-one years of age and has three children. He "worked out" a quarter-interest in a great establishment where he had been employed since 1897 and later sold his holdings to one of the other partners. He gives a list of bonds and stocks he owns which at the present market price amount to about $82,000. He has been in poor health and writes that he has been approached to sell some of his present

---

urtesy Printers' Ink

holdings to purchase stock in a new commercial enterprise which promises a greater return on his money. He wants his wife and children to have a larger income in case he should die. The editor tells him not to buy the new stock and gives him four suggestions for changes in his investments which will make his present and future income more secure. He saves misery and unhappiness for this little family, which of course is the most important point. But also, Mr. President of the American Radiator Company, and you, Mr. Vice-President in charge of sales for the Mohawk Carpet Mills, and you, Mr. Sales Manager of the Chamberlain Weather Strip Company, he, and the other men in many lines who are trying to save people from bum investments, are saving sales for you over a long period of coming years.

There is no amount of sales resistance that can compare to empty pockets—there is no good in consumer acceptance when the bank balance disappears.

It's a sales problem, men—what can we do about it? What can manufacturers do to help along the valiant efforts now being made by some publishers and other organizations mentioned hereafter in this article?

In these days of big figures on reparations and bonus bills and the like, it may not mean much to say quickly: "We lost $500,000,000 in sales to the blue-sky promoters. Isn't that terrible?" Let's say it this way: "There go 10,000,000 suits of clothes at $50 a suit into a big black hole with no return to the maker, no profit to the retailer; or there go almost 1,000,000 tractors at an average of $600 each. There goes a pile of farm implements, millions of beds and Victrolas and hardwood floors. There go 200,000,000 Congoleum art rugs, size 3x6 feet, retail price, $2.50 each." Five hundred million dollars put into pretty certificates that can't even be used as wallpaper, instead of being invested in the things you manufacturers are making for the comfort and well-being of your fellow citizens. It's a rotten situation and I think men interested in making and selling adverised merchandise can help to clean it up. Many of you are doing something now in the way of contributing to worthy organizations which search out and prosecute fraudulent promoters.

There are many valuable slogans around, such as "Before you invest, investigate," and "Ask your banker first."

A farmer in New Jersey, who had read the latter slogan, went to the president of his local bank three months ago to ask him about an investment of $4,000. A neighbor had received a high pressure circular which painted a certain oil stock in glowing colors. The neighbor "took a flyer" and advised him to do likewise. The banker didn't even need to make an investigation of the company. A quick look at the circular was enough. He proved to the farmer's satisfaction that a flyer would mean a total loss of the money. The upshot of his visit was that he invested $2,000 in a Liberty Loan bond, and preferred stock in two good industrial companies. With the other $2,000 which had been saved for him by the banker, he bought a truck to carry tomatoes and garden truck to market. This is an incident I know of. It's the way it works in thousands of cases. It is truly a sales problem for all of us. What more can we do?

Just as a definite suggestion—because I think something should and must be started aggressively—I am going to offer ten rules right here. You can probably write better ones. But let's get ten rules, then use them. You men have more sales ability than these fakers and swindlers. You can get out better booklets. All we need is subject matter in common terms to appeal to plain folks.

(1) When a stock salesman tells you "now or never," the answer is always "never." Good investments will be here tomorrow. Get sound advice before you buy.

(2) Don't try to combine gambling with investment. The more interest the more risk.

(3) Don't buy swamp land 1,000 miles away. If you buy real estate, buy right near home.

(4) Watch out for the man who offers a big stock bonus. It's cost many folks their life savings.

(5) Don't invest in another man's dreams. Be especially suspicious of the man who tells you how much a $100 investment in original Ford or telephone or other similar stock is worth now. For every big winner many more fail. A man who has discovered a diamond mine doesn't tell the world about it. Out of every 100 new businesses started, 87 fail and only thirteen prove successful!

(6) Mining costs big money. Shun the man who tells of the mountains of gold that beckon on the blue horizon.

(7) If you must gamble, gamble on yourself. Don't play the other man's game.

(8) Don't stay on a sucker list. If strangers write offering to make you rich, tell them to remove your name from their list. Get off the list. Some of those birds can write.

(9) Crooks take advantage of every invention. Watch out now for fake radio stocks.

(10) Most fake promoters use the money from stock sales to pay running expenses. Buy mahogany furniture for your own house instead of for a bucket shop.

There are many better sets than Dickinson's rules. There are, for example, "Eight ways to test safety of investment," and "Six questions to ask a stock salesman" which I have seen lately. Mine have only the advantage of not being too technical as some of the rules are. The blue-sky salesmen talk dreams and castles and a large house by the side of a lake. arguments can't be licked by charts and figures alone. I think your organization can write as good a set of rules as mine, probably And I think he ought to do it right away. The situation of you losing share of $500,000,000 is mighty bad.

We need more literature in understandable language to compete honeyed words of the crook.

Your own set of rules with your name at the bottom can be used sorts of advertising purposes such as package inserts, dealer helps, letters to employes, pay envelope stuffers and pages of copy in house-organ or employes' magazine. I mention this simple plan first I am sure that some of the best literature to beat the crooks at their game could be produced by men who know how to talk to plain folks in ple but dramatic words. Let's try it.

But don't stop at the production of new ideas. We must market and also encourage and aid the many present agencies which are helping kill off the sale of worthless securities, and in addition start some new working; ideas based upon sales strategy which has been found successful selling merchandise.

Let us consider some of the agencies now doing excellent work; that might do more work, and how we can help them. There are, for example, the excellent Better Business Bureaus working with the National lance Committee. At present there are thirty-eight active bureaus all men of experience. With the *Printers' Ink* Model Statute as their right these bureaus have kicked out many promoters of worthless securities their limousines and mahogany offices and put them at the far more occupation of cracking stones. These Better Business Bureaus exist the help which business men like yourselves give them. They want tributions and other help. Give them money and tell them when a friend yours gets literature from a man selling fig farms or gold mines. be a case for them. The Better Business Bureau of New York in to its punitive work against crooks has recently published some very lent guides to investors which, if generally used, would save millions the public. There is probably a Better Business Bureau in your city. list will be furnished on request.

Of course, when crooks are driven from the advertising columns of lications they seek some other medium. Usually it is found in the You can block them there. Make a complaint to the Post Office when you get advertising matter through the mails that you are of. The Post Office welcomes such complaints. And it can clamp the crooks. Look what it did to "Doc" Cook and his fake oil promotion He got his deserved sentence.

Then there is the Young Men's Christian Association which every runs a Thrift Week. The Associated Advertising Clubs of the World Savings Division of the United States Treasury Department and other national banking, commercial and social welfare organizations cooperated. A real drive is held for one week. Mats are distributed local committees, millions of pieces of direct-mail distributed and all of machinery brought together and coordinated. The crooks, work all year long. Perhaps you and I, if we get excited about this can encourage the Y. M. C. A. to keep its machinery active all through year, to keep it running both in favor of thrift and to distribute a a week to whole communities. A steady stream of warning literature, advertising and speeches, under the control of a national committee I feel sure, lop off five or six million dollars from the easy money the are now getting.

The Association of National Advertisers has in the past done much work among its members to make the work of fake stock promoters difficult. This association, too, could cooperate effectively with other zations.

The National Association of Manufacturers has done much for the past. It, too, could edit a series of warnings against the wildcat written in simple language, which could be distributed as envelope every factory of a member. Simple words well illustrated could as warnings on factory bulletin boards, motion pictures used in projection rooms. These same suggestions apply to the American ment Association and the scores of other associations of manufacturers to the United States Chamber of Commerce with its strong local tions. Charts alone won't do for this drive. We've got to make the dramatic and simple and to the point. We've got to present our unexpected ways and in unexpected places. That applies to Much valuable work for thrift and against the promoters of blue been done by the American Bankers Assocation and by local banks tising cooperatively. But everyone expects banks to utter warnings.

More copy in less expected ways, more dramatic window the bank in Chicago which used 17,000 live bees on one side of the at their work of storing a little in a safe place against a rainy day, the other side, a pile of worthless stock certificates with play cards with their warnings. Such things are necessary. more copy, bigger space, more dramatic warning messages if help save part of this $500,000,000. The American Bankers branches in every city and hamlet. It can do much more to make of the fake promoter difficult.

Many department stores now run editorial preachments in their daily copy. Many could adopt warning rules for use in this many retailers would be glad to be furnished with suggestions lines as well as unusual window displays to swat the crooked is stealing their sales as well as yours.

Corporations when sending out their dividend checks could warning slips. The crooks are after the wise investors, too, and get a stockholder to trade real stock for a pretty certificate.

AND THIS IS AMERICA!

How the Unions Have Become Virtual Dictators

By JOHN C. DINSMORE, PH. B.

Purchasing Agent, University of Chicago; Secretary-Treasurer,
Purchasing Agents' Association of Chicago

USURPATION of Authority to the degree of dictatorial control in more than one commonwealth in the United States by organized minorities is some-
g with which citizens of this community
e been regaled at various times for more
ı a year. Outraged citizens have burnt
vhole sections of the dictionary in voci-
us "Vox Pop" communications con-
ıning first one and then another of
acts of privately organized minorities
ch have made laws apart from those
ed by the legally constituted bodies of
federal, state and local governments
forced them down the throat of Mr.
n Citizen, taxpayer, man of family and
ector of laws.

ut right here in Chicago these same
estors of outraged government are con-
ıted with the specter of something
ally as bad. That something is the
that no man in this great metropolis
so much as undertake to build for him-
a home of his own in which he and
family can reside without first genu-
ing before "laws" and regulations laid
n by leaders of private organizations,
er known as labor unions—organiza-
s in which pistols instead of gavels
used on the rostrum by czarlike bosses
querading under the grand titles of
esidents" and "business agents."

/ithout even official government protest,
e men are able to force any citizen
lo things their way at greater cost to
Citizen, and often in direct violation
he Federal Constitution.

or illustrative purposes, let us take
case of any average citizen in Chicago;
instance, a man employed by a large
oration as purchasing agent and earn-
let us say, $5,000 or more a year.
us call this man "Al Barnhard" for
same reason, and add that his employer
he "Kennedy Metal & Refining Com-
y."

Al" started to work for the Kennedy
ern several years ago. We find him
ıis writing advanced to the position of
chasing Agent, 40 years old, and the
essor of a wife, two kids and an ob-
tion to pay a landlord of the specu-
e variety at least one-fourth of his
re income for rent.

he scene now is laid in the living room
he Barnhard "apartment." The kids
been put to bed and Mrs. Barnhard
roaches "Al" with a question and a wor-
look.

"The landlord is going to boost the rent again in the spring," she begins. "We won't be able to stand it. This is hardly the time for us to start life over again living in cheap districts. There is only one thing for us to do—own our own home quit paying rent. I've still got that little nest egg that Papa gave me and we can start on that. It is up to you to carry out my plan."

"Al" agreed. Further discussion and "Al" was enthusiastic. He became elated. They would not only build their own home but he would save a bit by buying his own material and hiring the workmen instead of farming out the job to a contractor.

A lot in a suburb was purchased and plans drawn for a modest bungalow. The architect broached the subject of a contractor.

"No," said "Al," "give me your bill and I will pay it; you hire the workmen but as for buying material, that is my second name; I'll buy the material and build my own home."

What "Al" Found Out

Barnhard went to studying the building plans with this result: He found the various mechanics are working under what is known as the Landis Award, which is as follows:

Excavators,	Union or	Non-Union
Laborers	"	"
Carpenters,	"	"
Lathers,	"	"
Glaziers,	"	"
Painters,	"	"
Roofers,	"	"
Sheet Metal,	"	"
Plumbers,	"	"
Gas Fitters,	"	"

He discovered the following to be strictly union, under the old time rule:

Masons,
Plasterers,
Steam Fitters,
Electricians,
Fixture Hangers,
Tuck Pointers,
Pipe Coverers,
Drain Layers,
Teamsters,
Chauffeurs.

The problem which then confronted "Al" was as follows: When an individual tries to build his own home, if non-union workers of Landis Award jurisdiction are employed on the building, the men belonging to the unions who refused to abide by the Landis Award, refuse to work. "Al" then took himself unto a lawyer.

Tells It to His Lawyer

"What can I do?" he asked. "No matter which way I turn these skates are able to tie me up so I will lose everything. I tried to do this thing so that I will be able to give a home to my wife and kids. If I have to build the way the Business Agents tell me I have to build, then I can't afford it. Between the speculative landlord and the leaders of these unions my case is that of the fish which can only jump from the frying pan into the fire and vice versa."

Learned counsel then speaks:

"Until the majority of people rule in this country without bowing to organized groups and blocs of one nature or another, the average citizen will have a hard time of it. When all men compete on their merits rather than with blackjacks, and politicians pay heed to the people rather than self-appointed leaders of organized minorities, then you can build your house your own way. In the meantime, get an honest contractor and trust to luck."

The lawyer has said all there is to say, Mr. Reader. You now behold the spectacle of the Purchasing Agent who, because of his ability, was entrusted to spend close onto a million dollars a year for his employers, but still when he wanted to benefit by purchasing for himself and building a modest home, was held back by hidden powers which have made for every freeborn American citizen laws beyond the law.

MINIMUM WAGE LAWS

Tried and Found Wanting

WAGE fixing by law, like price fixing, never works. It does the wage earners more harm than good. It disorganizes industry.

At nearly every session of a state legislature, attempts are made to pass a minimum wage law. These bills are introduced by organized bodies who know little or care less of the economic effect of tampering with industry. In states where a minimum wage laws are effective, notably in California, those expected to benefit by such legislation find themselves worse off than before.

A minimum wage law was passed in Babylonia during the administration of Hammurabi, who antedated old King Tutankhamen by 3000 years. King Hammurabi's minimum wage statutes, fixing the wages of artisans and others by law, have been discovered by excavators. They did not work and were abandoned. Minimum wage laws were tried in Greece, in Rome, in England and in the early colonial days of this country but were discarded as useless attempts on the part of the government to interfere with the development and liberty of the citizen.

WITH THE PUBLIC UTILITIES

Outstanding News Notes of the Week

A STRAIGHTFORWARD public accounting of operations and purposes is the one means by which public utilities will be permitted to remain in the hands of private enterprise, the convention of the National Electric Light Association was told this week by former Congressman Philip H. Gadsden, vice president of the United Gas Improvement Company, Philadelphia, and B. J. Mullaney, director of the Illinois committee on public utility information, Chicago.

The addresses marked the opening session of the forty-seventh annual meeting of the organization in Atlantic City. More than 6,000 public utility executives, managers and technical experts were in attendance.

Declaring that municipal ownership sentiment has virtually disappeared because of a more frank attitude by municipal utility managers in their relations with the people, Mr. Mullaney said the public ownership advocates have transferred their labors to agitation for government owned super-power lines. It is up to public service corporation executives to combat this movement by honest publicity methods, he added.

Mr. Gadsden traced the diminution of criticism of public utilities in the last five years to intensive cultivation of the channels afforded by the press for public education on the problems of public utility management.

"However," he declared, "we have only touched the surface of this phase of our work. Where those who preceded us in the management of public service companies believed their work was done when they had solved this or that mechanical or technical problem, we must, and are coming to realize that a sympathetic and satisfied public understanding and cooperation is absolutely a fundamental requirement of the development of these utilities in the hands of private enterprise."

Mr. Gadsden, who is chairman of the Pennsylvania committee on public utility information, struck a popular chord with his hearers, including several thousand executives of great electric and power companies, when he said that the first essential in the establishment of better public relations was the establishment of better relations with the 750,000 employes of these concerns and the adoption of systems of education to convince them they are integral and essential factors in an industry the possibilities of which for human progress are without limit.

Pacific Gas & Electric Co. has contracted with Nevada Irrigation District at Grass Valley for use of water developed by district. Estimates place annual payments to district at $375,000, which will provide interest and sinking fund for contemplated district bond issue. Negotiations under way for two years were consummated by California Railroad Commission acting as arbiter. Water concerned is developed in Sierra country, known as Jackson Meadows and Bowman Lake, and will be handled through Pacific Gas & Electric plants below Lake Spaulding before being returned to irrigation at the foothills.

Interests closely identified with the New York Central indicated this week that the road's equipment note issue, totaling more than $20,000,000, might be offered this week. It also was reported in banking circles that the Baltimore & Ohio's first refunding issue of about $20,000,000 would be placed on the market within a few days, as well as a smaller offering by a prominent northwestern road.

A syndicate headed by Kidder, Peabody & Co., and including the National City company and Kuhn, Loeb & Co., offered $9,000,000 Czechoslovakia republic secured external sinking fund loan of 1922 series "B" 8 per cent bonds, due Oct. 1, 1952. The offering price was 96½, to yield about 8.30 per cent to maturity.

A block of approximately $6,000,000 of the bonds was offered in London by a syndicate. The bonds offered constitute the unsold balance of the $50,000,000 bonds authorized by the government of the Czechoslovak republic in 1922. At that time approximately $30,000,000 of the bonds were sold here and in London.

Plan for a reorganization of the Second Avenue Railroad (New York) which has been in receivership for 15½ years, are being worked out and the program is expected to be presented to security holders within a few weeks. Should it be approved by the several groups of bondholders, the plan will be submitted to the courts with a view of terminating the receivership by Fall.

The receivership is believed to have set a record for duration among the city's street railways. The company was incorporated in 1853, and its line leased in 1898 to the Metropolitan Street Railway Company at an annual rental of 8 per cent on the stock for the first three years and per cent thereafter.

In September, 1908, a receiver was named as a result of a suit brought by the Guaranty Trust Company to foreclose the consolidated mortgage of $5,682,000, against which there had been issued a like amount of 5 per cent consolidated gold bonds, due February 1, 1948. These bonds represented a tragic investment for hundreds of persons who saw their holdings drop to virtually nothing. Some of the bondholders have died meanwhile, and two of four receivers have died in office. Charles E. Chalmers, the present receiver, has served more than four years.

It is understood that a reduction of outstanding equities will be required for the company's restoration.

The Mississippi Power and Light Co. announces the acquisition of the power station of the Tupelo Cotton Mills, Tupelo, Miss. The company has contracted to furnish the mills with their requirements for electric power (approximately 1,300 horsepower) and for the large amounts of steam used in mill operations. It has also contracted to supply to the city of Tupelo its requirements of electric power, which includes power used for pumping the city's water supply. Until such time as the power station acquired from the Tupelo Cotton Mills can be enlarged the company will operate the city station.

Net earnings of the operated public utility properties of the Standard Gas & Electric Company for the year ended March 31, last, increased 16.80 per cent as compared with net in the corresponding period a year ago. The net before depreciation amounted to $19,532,056, as against $16,722,623 a year ago, or a gain of $2,809,433.

To some extent the larger net earnings were due to a reduction in operating expenses and other deductions gross having increased $4,834,839, or 11.28 per cent, to $47,782,061. The report for the combined properties compares as follows:

Year ended Mar. 31:	1924	1923
Gross earnings	$47,782,061	$42,947,222
Net before dep............	19,532,056	16,722,623

The Northern States Power System contributed the largest amount of both gross and net in the year ended March 31, last, these being $19,241,149 and $8,543,015, respectively as against $17,725,446 and $7,654,080 in the corresponding period a year ago.

The National City Bank of New York announced Tuesday the formation of a French banking company to take over the business of its Paris branch. The new company has a subscribed capital of $30,000,000. No change in the management or in the character of the bank's service in Paris is involved. Transfer of its activities will be made immediately.

Railroads representing ninety-six per cent of the mileage of the country have authorized expenditures of $766,000,000 for permanent improvements and new equipment during 1924.

The amount actually expended for these purposes up to April 1 was $185,500,000. These figures were made public this week by the American Railway association and the Association of Railway Executives in joint session at the Blackstone hotel.

The totals show a reduction in appropriations over 1923, when $1,059,149,426 was spent for improvements and equipment, but, excluding last year, they are larger than in any other year in the last ten. Reduction in the appropriations this year is said to be due to threatened legislation against the railroads.

RAILROAD NOTES

ETAILS of the Missouri Pacific offer to take control of the New Orleans, Texas and Mexico Railway known as the "Gulf st," were made public this week. The Missouri Pacific has ed to buy outright 37,500 shares and to take an option on 00 additional shares of the "Gulf Coast" stock. The directors ne latter road have approved the plan.

he Missouri Pacific will now apply to the Interstate Com- ce Commission to permit the purchase, which would give road 51 per cent of the "Gulf Coast" stock, or control. That ount of stock is now held by bankers here.

he purchase of the first block of Gulf Coast stock will be ctive June 2. The Missouri Pacific is to pay $120 a share, ng fifteen-month notes bearing 7 per cent interest. The shares er option carry the same price, but payment is to be made in er cent collateral trust notes running fifteen years. These will redeemed at par. An annual sinking fund of $1,200,000 will set aside for that purpose.

As part of the purchase agreement, the Gulf Coast directors lared a special dividend of 16½ per cent and rescinded a 10 cent stock dividend voted in February, but not distributed. e special dividend will be paid on June 2 at the rate of 4½ per t in cash and two issues of 6 per cent warrants maturing respec- ely September 1 and December 1, this year. The total is $2,475,-).

Gulf Coast minority stockholders who take advantage of the er of the Missouri Pacific will receive the equivalent of $130.50 share, including the special dividend, after deducting commis- ns to bankers. The Missouri Pacific yesterday received permis- n from the Missouri public service commission to issue $4,500,- 0 of notes and the proceeds will be used to pay for the first ock of Gulf Coast stock.

The merger of the two roads was recommended by the Interstate mmerce Commission. It follows the commission's plan of gional groupings.

Freight traffic on railroads operating east from Chicago and St. Louis reflects the slowing down of industry and commercial activities in many lines. The total volume of freight handled is running smaller than a year ago in most instances. Traffic officials, however, continue to point out that the totals now still compare quite favorably with most years at this season. Southern roads report a shrinkage of moderate proportions in general merchandise.

Proposed new freight schedules increasing rates on grain and grain products from Chicago and Milwaukee to New York harbor via lake and rail routes, were suspended until Sept. 14 by the Interstate Commerce Commission. Proposed new schedules, changing the differential basis of freight rates on newsprint and other paper from points in Michigan to Louisiana and Texas destinations were suspended until Sept. 17.

The Central New England railway was given a tentative valuation of $22,063,019, as of June 30, 1916, by the commission. The tentative value of the Cadiz Railroad of Kentucky as of June 30, 1917, was placed at $120,500.

The Union Switch and Signal company has received an order from the Milwaukee for complete installation equipment of two union speed automatic control systems of 110 miles double track, which includes train control for seventy engines.

Pennsylvania railroad carloadings for the week ended May 10 totaled 154,583, against 152,903 in the previous week and 169,115 in the same week of 1923. From Jan. 1 to May 10, 2,842,377 cars were loaded, against 2,988,501 in the same period of 1923.

To meet the demands of increasing freight business, 100 new box cars will be added to the equipment of the Illinois Tractive system this month.

Barkley Bill Up June 2

EFEATED in a ten-hour fight for a vote on the Barkley bill to abolish the ilroad labor board, leaders of the demo- atic-republican insurgent coalition in the use were in doubt this week whether they uld get a decision on the measure at this ssion of Congress.

The bill, taken out of the hands of the mmerce committee May 5 through the alition's efforts, was kept from a vote ay 19 by the determined opposition of the ganization republicans, with the aid of epresentative Blanton (dem., Tex.), who peatedly demanded roll calls to summon quorum. When adjournment was taken ter 10 p. m. it was left in a position where nder the rules, it may not be called up gain until June 2.

Acting for the first time at this session on nportant railroad legislation, the senate ite Monday passed the Gooding bill to mit application of the long and short haul ause of the interstate commerce act.

The measure would restrict the interstate mmerce commission, in authorizing lower narges for a long haul than for short hauls ithin its limits, to cases involving ircuitous routes and export and import affic.

FINANCIAL

AN immediate drop of a point to 3 points in the main body of stocks, with even larger declines in a few specialties, was the market's response Tuesday to the final passage of the soldier bonus bill. Steel common had closed Monday at 97⅜. It opened at 95½. Similar losses occurred in other leaders. American Can sold at 98½ where it was off nearly 4 points. Baldwin Locomotive at 105 was off 3 points and at a new low for the year. Among the specialties Dupont and Cast Iron Pipe had the sharpest break, dropping 6 points each. Stewart-Warner at 53½ was down more than 3 points to a new low for recent years.

In the bond market the principal effect of the bonus victory was shown in Liberty bonds which were substantially lower.

After the first wave of selling, however, the stock market rallied quite sharply.

The hysterical selling of stocks at the opening could hardly have represented action by the more influential financial interests. That the passage of the bonus bill even over the presidential veto was a strong probability had been known for weeks. Its immediately adverse effects, so far as business conditions and the stock market are concerned, should have been pretty well discounted; and with its more remote effects the market of the moment is not so much concerned. Payment of $114,000,000 a year from public funds on the average for twenty years will interfere to that extent with tax reduction, and that is the principal unfavorable effect that will have to be confronted now. For the fiscal year 1925 payment is estimated at $152,500,000 and for 1926 at $155,500,000.

C. M. & St. P. Asks Loan

It is understood that the Erie Railroad has virtually completed arrangements with New York banks to do some new financing. The amount of the loan, it is said in reliable quarters, will be in the neighborhood of $10,000,000.

$10,000,000 *Loan for Erie*

The Chicago, Milwaukee & St. Paul Railroad has asked the Interstate Commerce Commission for permission to issue $3,370,000 general mortgage 5 per cent bonds as collateral security for short-term notes.

FIELD NOTES

A Page of News

New Wool Spinning Process

Considerable interest has been aroused in the explanation made by the Director of the British Research Association for the Woolen and Worsted Industries of a new wool spinning process whereby finer counts can be obtained. The wool fibers are stretched in a wet condition and then fixed either by steam, boiling water and some chemical agent. The process is still in an experimental stage and has not yet been tested on an ordinary manufacturing scale as a commercial proposition.

A Chinese Export "Tip"

The cut of Chinese clothing changes but little from year to year, but designs and color changes are taking place in increasing frequency, particularly in printed goods for the better classes. Merchants must keep abreast of these changes, and in order to do so, Trade Commissioner G. C. Howard reports, one British firm has established an art department in Shanghai. Designs are made up in color and orders taken from Chinese dealers for minimum quantities. Care must be exercised in guarding new designs so that they cannot be copied in cheaper materials and delivered before the original expensive and exclusive articles are put on the market.

The market in China for American clothing of all sorts is limited. The question of prices places foreign-made clothing out of the reach of the vast majority of native Chinese, and their living conditions make the native garments much more suitable. Such market as there is represents chiefly the demand of the foreigners who make most of their purchases in their own countries, or have their clothes made by Chinese tailors at a very low cost, says Assistant Commercial Attache A. H. Evans, Peking.

Where Meat Prices Go

Out of every consumer dollar paid for meat in successful retail markets, 76 cents is paid by the dealer to the packer or wholesaler, 19 cents go for the dealer's expenses, including wages, rent, ice, wrappings, and other expenses, and 5 cents represents the dealer's profit. This calculation is made by the United States Department of Agriculture based on a survey, conducted jointly with Northwestern University, of 143 retail meat stores in Chicago, Cleveland, and New York, from March, 1923, to February, 1924.

Zimmer Construction Company

Ney and Elizabeth Zimmer, 1556 W. Grand Blvd., Detroit, and Walter Jorgensen, 2545 Lothrop Av., have incorporated for $10,000 as the Zimmer Construction Company. The company will engage in the general construction business.

Flotation of Sulphur Ores

Considerable work on the flotation of sulphur from the low-grade sulphur deposits in Beaver County, Utah, has been performed by the Interior Department at the Salt Lake City experiment station of the Bureau of Mines. Vast tonnages of low-grade sulphur, assaying from 15 to 30 per cent, exist and it is necessary to beneficiate these ores in order to make the property commercially operative. It has been found that, by flotation, products assaying from 80 to 90 per cent sulphur have been obtained with recoveries of the sulphur content averaging from 85 to 90 per cent. This operation makes it possible to treat the low-grade ores which, without beneficiation, would not be of particular value.

Organize German-American Board

"A Board of Trade for German-American Commerce, Inc.," has been organized for the purpose of reestablishing and furthering commercial relations between the United States and Germany.

An announcement of organization states that the association will be the central body for the exchange of information in all matters pertaining to trade, industry and finance, for the widening of existing and the opening of new markets; for aid in facilitating customs and tariff matters; for arbitration of commercial disputes, and for rendering assistance in all questions which tend to promote and widen friendly commercial relations between the two countries. Organization is being extended to comprise the entire United States, with branches in all important centres. It will be in close cooperation with the existing organizations throughout the United States and Germany. National headquarters are located at 60 Broadway, Suite 507, New York City.

New Ford Ignition by Delco

The Dayton Engineering Laboratories Company, a General Motors subsidiary, makers of Delco starting, lighting and ignition equipment has recently added to its standard line a type of ignition specially designed for Ford cars. A feature of the new product is the automatic spark advance, worked out to deliver the best results at all engine speeds, using the hand spark advance only under unusual driving conditions. When it is desirable to use the hand advance, a series of definite stops prevents getting the engine out of time by any shift of the lever. The equipment is being distributed nationally through United Motors Service, Inc.

New Office for Sincere

Charles Sincere & Company, members of the New York and Chicago Stock Exchange and the Chicago Board of Trade, have moved their offices from the Board of Trade Building (Chicago) to the Illinois Merchants Bank Building, 231 S. LaSalle St.

St. Louis Note

Alvin C. Carpenter has been appointed chairman of the executive committee of the Manufacturers & Merchants Association of St. Louis for the coming year. W. Frank Carter is the new vice-chairman. Other members are, ex-officio, A. J. Davis, president of the association, W. L. Niekamp, George Weber and Charles A. Houts, vice-presidents; appointed, Henry Luedinghaus, James A. McKeown, Harry Scullin, R. W. Williams, Adolphus Boeckeler and J. T. Caradine.

His First Dollar

F. B. Jewett, vice president of the Western Electric Company, says he earned his first dollar as a boy for running an engine and boiler for a fertilizer works.

Bankers Meet June 19-20

The annual convention of the Illinois Bankers Association will be held in Decatur June 19 and 20.

Radio "Call" Device

Experiences when, as ship's operator aboard the *S.S. Spokane* and *Manchuria*, he was compelled to stand watch with his radio headpiece clamped to his ears for hours at a time, have resulted in Lewis M. Clement of the Western Electric Company perfecting a device by which warning of coming messages is given as in telephones. An ingenious arrangement provides for the sounding of a buzzer or bell when a call comes in for the receiving station.

To Manufacture Dairy Products

The Hemlock Cooperative Creamery Company (Hemlock, Mich.) will manufacture and sell all kinds of dairy products. Oscar Hoffman, Frank Short and Erick Bork of Hemlock are the incorporators.

$5,000 Reward Offered

A reward of $5,000 has been offered by Lloyds of London, through Toplis & Harding, Inc., Chicago, for the recovery of five United States Treasury certificates of indebtedness, stolen from the Peoples Trust & Savings Bank (Chicago) on February 19 last. The certificates are for $10,000 each, issued Dec. 15, 1923, bearing 4½ per cent interest, Series TD-1924, Numbers 9877, 9878, 9921, 9922 and 9923. The reward offer expires Feb. 18, 1925.

Semi-monthly Cotton Reports

Semi-monthly reports as to condition, progress and probable production of cotton are to be issued by the crop reporting board of the United States Department of Agriculture as provided by Senate Bill 2112 signed by President Coolidge May 3. The reports are to be issued simultaneously with the cotton ginning reports of the Bureau of the Census. Release dates of the cotton reports this year are as follows: July 2; July 21; August 8; August 23; September 8; September 23; October 8; October 25; November 8; November 21; December 8. The reports will relate to acreage and condition as of the first and fifteenth of the month, except that of July 2 which will be as of June 25. Heretofore, cotton reports related to the twenty-fifth of the preceding month.

Advertising Shortens the Road to Success

DO you doubt that a new hatter could spring up in New York and, with honest hats and brilliant advertising, in five years take its place abreast of the leaders of fifty years? It has been done.

Do you doubt that a new thought could arise in pencils, and, in two years, backed by good advertising, make a place for the pencil on the desks of the nation? That, too, has been done.

Do you doubt that a New York department store, in a bad year, could, largely through the improvement in its advertising, attract 110,000 new customers to its shop? That was done, last year.

A fine old business may consider advertising as a protection for today and insurance for tomorrow but to the young growing business it is a pair of seven league boots, which bring fame, friends and volume, years before their normal advent.

By THE SHOWMAN

EVERY so now and then I am accosted by some business man friend in some such fashion as this: "Say, Showman, you're up on this sort of thing: I've got a buyer in town and want to take him to a good play. Where'll we go?" I generally manage to please him—but the answer's not as easy as it seems.

There are always all sorts of plays a-playin' round about Chicago—some of them good, some of them not so good, and, sometimes, some of them plain *punk.* In the last case, well—you know what a bum steer means. Better to take your customer out to dinner and forget the theater entirely than to force him to sit through a poor performance.

They formerly said of the Imperial City that "all roads lead to Rome." Today, all railroads lead to Chicago. If I'm not greatly mistaken, there are more business conferences and sales meetings in Chicago than in any other city in America, with, of course, the possible exception of New York. (At that, I'll wager more *manufacturers and manufacturers' representatives* get together in Chicago than in New York.) At any rate, I imagine that there are a sufficient number of interested business men—manufacturers and such-like—to warrant a short and concise guide-column a week concerning the Chicago theaters. It's something we're all more or less concerned with, and—

THE OUTSTANDING FEATURE along the Rialto this week was the return of Mister Gallagher and Mister Shean, who are holding forth nightly in the Garrick Theater with the Greenwich Village Follies. If memory serves me aright, the last time Gallagher and Shean appeared here was in the Majestic, then a "two-a-day" vaudeville house. They have since risen to prominence and affluence—and the town is welcoming them back with packed houses. The Greenwich Village Follies is the usual hodgepodge of pretty girls, catchy songs and the rest of it—a good evening's entertainment requiring only two good eyes and ears.

D. W. GRIFFITH'S *"AMERICA"* continues in the Auditorium. I'm not a "movie" critic, and can't go into the usual details of "lightings," "effects," and so on, but I find it an interesting production, apparently carefully done with a eye to faithful reproduction of things historical.

TOPSY AND EVA still are drawing the crowds to the Selwyn. Personally, I wasn't taken with it. *"Uncle Tom's Cabin,"* set to jazz, is a little beyond me—but the rest of the audience seemed to like it, which, I suppose, is all that is necessary.

NEW TOYS, at the Central is good. Ernest Truex is particularly excellent throughout. I liked the performance quite well, except that, in parts, it appeared as though the author (or is it authors?) purposely blunted the lines to keep them from going over the heads of the audience. Which is not particularly complimentary.

I CAN'T allow the week to pass without reference to the closing of the old Colonial Theater. You doubtless remember the Iroquois Theater fire disaster. The Colonial was the Iroquois, rebuilt, though of course *that* has always been a subject dealt softly with. The public is "queer" about such things, you know. Anyway, the Colonial has closed, and will be razed to make way for a new Masonic temple.

I SHALL CONCENTRATE next week upon one chosen play—I don't know just what one, as yet, for I have not yet communicated with my box-office friends. If, in the meantime, there is anything that I may do in your service—the purchase or reservation of tickets at any of the theaters, the *facts* concerning any current production or place of amusement, or anything whatsoever along those lines—please call upon me.

—THE SHOWMAN.

UNION METHODS

How Labor "Handles" Politics

TWO years ago I wrote Small, complaining bitterly of the administration of the workmen's compensation law.

"I went so far as to say if the board were not revamped and justice accorded our members I would have the agents of the miners determine how much was due injured members, and then *I'd strike till that amount was paid.*

"As a result, the commission was completely revamped. *Our friends control the commission.* If we don't get what we want, it will be our fault."

This statement was made by Frank Farrington, president of the Illinois organization of the United States Mine Workers of America, in an address this week before the miners' state convention in Peoria.

It graphically portrays, according to observers, the predicament in which the long suffering manufacturer is placed, not only in Illinois but throughout the union.

"I am surprised," commented one leading manufacturer, "that Farrington had the nerve to make that statement. It simply goes to show, however, the confidence that labor has that it has the struggling manufacturer and mill and mine owner 'on the hip' and can do as it pleases with the laws and their administration."

One wise action was taken by the miners. They refused, by a vote of 385 to 105, to elect delegates to the St. Paul conference, called for June 17 for the formation of a "national labor party." They indorsed the Federation of Labor policy of electing "friends" in the Republican and Democratic parties.

nresistance. We believe that there have en just wars. We believe that there have en unjust wars. We believe in peace—t not at the expense of that which is ht.

But we deplore a seeming tendency upon part of certain persons and organizans to persecute that group of men and men who believe differently—who are of opinion that all war is wrong and that, ther than a single life be lost in battle, tter no resistance for any reason whatsoer.

These pacifists are entitled to their own inions and to a reasonable expression ereof. We think they are wrong, and we e entitled to that opinion and to a reasonle expression thereof.

The American people are entitled to *all* e facts, fairly represented upon both des of all questions. If, being given ose facts, the American people are unable decide upon that which is best, then our rm of government is faulty—and we had st change it, and quickly.

CHICAGO

CHICAGO is a poor point from which to issue a magazine. For some peculiar eason, everyone immediately jumps to the onclusion that said publication is a purely ocal medium. New York, now, is diferent. No one suspects a publication of eing devoted to New York interests alone, imply because it happens to be published ere.

Chicago is the manufacturing and raiload center of the United States, just as New York is the financial and shipping enter. Thus, Chicago is the logical place f publication for a manufacturers' peridical, just as New York is the logical place f publication for the nation's financial eviews. That is why Manufacturers News is published in Chicago.

There are some generally erroneous imressions abroad which we think ought to e corrected. One is that Manufacturers News is published for Chicago and Illinois. *That is not the case.*

Manufacturers News is a *national* weekly in the fullest sense of the term. We elieve that Chicago, as the manufacturing nd railroad center of the nation, is of ome interest to manufacturers everywhere, ut we're not boosting Chicago nor Illinois nor the Middle West nor any other section. Manufacturers News is published in the interests of the manufacturers *of the United States.*

Durant-Star Consolidate?

Consolidation of Durant and Star interests is ought in the proposal to increase the capital tock of Durant Motors, Inc., 50 per cent, for the urpose of acquiring the assets of the junior nterprise. The latter, though equally a project f W. C. Durant, has been independently operated eretofore, Star cars, being built on contract at he Durant plants in Elizabeth, N. J., Lansing, Mich., and Oakland, Calif. The present plan is to nite the two concerns under conditions which ould be mutually advantageous.

department since the session began, and now that its chickens are coming home to roost, Congress is in a genuine panic. It is confronted with the possibility that if the presidential veto already in hand and yet to come are sustained, it will be forced to adjourn with a negative legislative record as the logical outcome of its own mad political hysteria.

In all the picture in Washington of legislative destruction and desolation, the calm figure of the President in the White House dealing out common sense body blows like the bonus veto stands out before the country like a lighthouse in a fog. The President lacked four votes to sustain his veto on the bonus bill in the Senate. The House overrode his veto by a wide margin, because the suggestion of bonus legislation originated there, and not with the world war veterans. The country, as evidenced by the telegrams and letters which poured into Washington, supported the President on this issue. The contest over this measure was bitterly waged. Because of the peculiar situation on this particular measure, the odds were against the President.

Another desperate contest will be staged in the House over the Barkley-Howell Bill, supplanting the Railroad Labor Board with a series of powerless commissions from which the mediating influence of public interest has been eliminated. Two weeks ago, the committee on interstate commerce of the House was discharged from consideration of this measure by a majority of approximately twenty votes. Since that time a battle royal has been waged in which the opposition to the measure has made gains. This is evidenced by the fact that the proponents of the bill have sought to make combinations to save it with the supporters of the McNary-Haugen bill, and other class legislation measures. It can be predicted now that the Barkley-Howell bill cannot be rushed through the House, and that it cannot be passed by the House without amendment. There is even a possibility that it may be defeated, although the vote will be close, too close for certainty.

Continued from Page 12

Publishers, who now run advice columns, should be encouraged and there are certain others who could add such columns with advantage. Any man who wants to do a real job in his own city now can call a meeting with local representatives of the Rotary, Kiwanis, Elks and similar clubs, start a subscription list, call in an advertising agent to get some "plain folks" copy and start a warning campaign which will save real money for his fellow citizens.

Then there is the American Farm Bureau Federation which could do much more to warn its members. Senator Norris pointed out recently in the Senate, how such news as Henry Ford's offer for Muscle Shoals is used by the crooks to take hard earned money away from promoters who use such means to sell worthless land. One promoter in letters to farmers said that his lots would be just far enough away "to avoid the odor of the fertilizer plant!" The Federation could do much to aid the efforts of publishers who warn their subscribers to stop, look and listen before investing. The farmer, as one of our big purchasing classes, should get more help which would enable him to know the sheep from the billy goats in investments. The American Federation of Labor could use a set of warning rules in each issue of the "Federationist" and posters in every union headquarters. Members of the Federation are now being robbed by the men who sell paper and make people think it means value. The success of the labor banks is going to make the work of these blue-sky salesmen more difficult. But the Federation could distribute blanks like those of the Better Business Bureau of New York and save another $20,000.000 or so for wage workers to invest in tangible things instead of phoney certificates. Advertisiing agents can develop many new cooperative accounts among public-spirited citizens, banks and associations with copy which will warn the public in simple words. Many agents have done this sort of work and more could be done.

Millions of dollars each year are stolen from doctors and dentists. As any salesman for fake stock can testify, they are among his most prolific sources of revenue. Medical and dental associations should make the work of these thieves more difficult among their members. In these two groups alone there exist a brilliant opportunity to save for legitimate investment several million dollars a year.

Life insurance companies could insert booklets in notices to policyholders. They should also use more advertising to warn customers and prospects not to buy blue sky. Many a policy has been allowed to lapse when the insurance money went into oil wells. Thousands of people have passed up life insurance for the glittering promise of a life of ease watching fig trees grow.

The parades of people who have been stuck by fake promoters march past retail stores without buying. Money is coming out of the tills of those retailers. They can act cooperatively to stop it.

If official organizations in all the groups mentioned above would appoint one or two men to cooperate with a central committee a drive against the blue-sky men could be put on for a full year which would save millions for productive industry. It is high time we did something to make a concerted drive against these rats who are gnawing at the foundations of our national happiness and prosperity.

Now is the time to start.

It is a problem upon which capital, labor, producer, consumer, management, farmer, wholesaler and retailer, buyer and seller, can all agree and cooperate. Let us encourage the work now being done. Let's start more work and secure wider cooperation and coordinated effort.

It's time we stopped letting the blue-sky promoters steal money from the homes of our fellow citizens. We can each do something to help this rotten situation. And we can start today.

trained 37,000 foremen. The basis of the course is the organization of a study-club, or group-unit. Though the outside educational institution assists in the organization of the study-group. the administration is in the hands of the foremen-students. As a rule one of the company executives undertakes the chairmanship of the group. He is guided by definite instructions from the educational institution. The text books are carefully prepared by specialists who not only know the subject matter but understand from first-hand knowledge the needs and psychology of the average factory foreman. The course lasts twelve weeks. A group meeting is held at the end of each two weeks' study period. The foremen review the subject matter and learn to apply the matter to their local problems. The meetings are held after

Continued from Page 9

In photographic lenses, however, it is necessary to recognize and correct for five different kinds of spherical aberration, and the manufacture of high grade photographic and astronomical lenses has been increasingly complicated.

For accurate work in astronomy it is vital that the huge reflectors (mirrors) and lenses maintain a constant temperature. To achieve this, elaborate precautions are necessary whereby constant temperature vaults are provided whose temperatures are maintained by the circulation of brine in pipes, and even the mirrors are "put to bed" under many layers of blankets in order that the temperature changes may be evenly maintained. All of these precautions are taken to avoid the distortion which would follow a temperature change in any one section of the lens resulting in internal stresses. The low coefficient of thermal expansion, again reverting to the second mentioned notable property of clear fused quartz will perhaps do away with these precautions. A telescopic mirror or lens made from quartz would certainly go through a range of temperature changes without distortion of the image. Add to this the fact that clear fused quartz can now be produced in relatively large masses; that the supply of raw quartz constitutes no less than three-fifths of the earth's surface (considered to be ten miles deep) and the more apparent applications are accounted for.

Glass condenser lenses for use in the larger motion picture machines have a comparatively short life, often breaking in a day or two. Frequently these lenses are subjected to the heat of an arc consuming 150 amperes of current. Quartz lenses have been operated in motion picture projectors for six to eight months and are still intact. These lenses are also more free from pitting deposits which result from hot particles thrown while molten from the carbon.

The development of this material and the ability to produce it come as a result of nine years work on the part of Mr. Berry and his assistants, L. B. Miller, P. K. Devers, and Wallace Wright, all of the Thomson Research Laboratory staff.

The paper delivered by Mr. Berry before the forty-fifth annual meeting of the American Electro-Chemical Society, at Philadelphia, explains the processes of production of clear fused quartz as follows:

> It has been possible for many years to make fused quartz of a high quality in small sections and lengths by hand labor in the ordinary blast flame, using gas and oxygen. This has been done by piecing together small sections of crystal in the flame, or by adding silica powder from time to time until the piece has grown to the heating limit of the flame; an obviously slow and expensive process. From this step in the development of the art to the point where very large masses of equal quality can be made has been long and difficult.
>
> "In the last few years the advances made by the process described in this paper have been so rapid and far-reaching that there seems to be no limit now to the size of high quality clear fused quartz which can be made, except that which may be imposed by mechanical difficulties.
>
> "There are two distinct steps in the preparation of these tubes, rods, ribbons and cane; the most important of which is the initial fusion. The

CONSIDER OTHERS

By DR. FRANK CRANE

IN some people ambition is merely another name for selfishness. They are ambitious as a hog is ambitious.

It is all right to want to get on, but not if it implies stepping on somebody else.

"I Want What I Want When I Want It," is funny as a song on the vaude- stage. It is pretty coarse stuff when you hear it at home.

ants are essential to getting on, but if they are not accompanied by discipline and control they are but wild winds and unchecked fires.

iere are those who are as full of wants as a vacuum is full of nothing. They shove rs aside, step on their feet, hurt their feelings and bowl them over. Their notion of ss is the same as the German Army had in Belgium. They want their own way re- less of the comfort of others.

mong the ignorant this appears as brutality: among the educated and clever it is d by more respectable names, but it is just as bad.

ie tyrant king, the arbitrary employer, the intolerant fanatic, the insolent political , the domineering parent, the overbearing husband, the martinet school teacher, all of by and by accumulate hate and ill-will enough to demonstrate that their efficiency is rm of suicide.

eal Success means gaining the cooperation of others.

o sow gratitude and loyalty and affection brings a crop of able assistants. You can r tell when they will do you a good turn.

o man of sense needlessly creates ill-will. Even a wounded rat will bite and a hed bee will sting.

he best part of any man's business achievement is the kindly feelings he has created thers. Pushing and goring and jolting is not efficiency. It is plain rudeness. It is id.

he first and greatest rule in business is: *Consider Others.*

lost of the joy of life comes from the way others treat you and from their feelings ard you. And as with anything else, if you want that, you must pay for it. Pay for courtesy, thoughtfulness, generosity, toleration, charity and love.

his sort of coin is good, not only in Sunday school but in the workshop and the e.

ou get what you give this world. Reaction is equal to action.

onsider others and they will consider you.

rush by, knock 'em down, crowd ahead, kick, gouge and elbow your way to the front, somebody will be there to hand you a few choice knocks that will take the joy out ife.

is a good thing to count the cost, to estimate not only how much money and fame are going to make, but how much hate you are going to acquire, how many enemies are going to raise up, and how many of your fellowmen will be glad when you dead.

rint it in large letters and hang it up on your wall:

ONSIDER OTHERS.

Good Peach Crop Expected

ospects for a uniformly good peach crop in mber of the southern peach growing States eported as of May 1 to the United States rtment of Agriculture by its agricultural ticians. An excellent bloom is reported in rowing sections of Virginia and the fruit to be setting well. The condition of the May 1 is estimated at 89 per cent of normal. ually fine prospects are reported in North ina. Some injury by late frost in South ina is reported but the trees are sufficiently d for best results. The condition of the May 1 was estimated at 78 per cent. Another crop in Georgia is indicated, Hiley Belles the only variety seriously injured by winter s.

California Orange Crop

e California orange crop this season is about 0,000 boxes according to a revised estimate e United States Department of Agriculture. crop last year was 22,800,000 boxes, and the ding year it was 20,500,000 boxes. The ed estimate just issued is higher than the minary estimate of last December. Shipments e navel crop are now closing and those of the ncias are beginning.

Counterfeit

Counterfeit $5 Federal Reserve notes are in circulation. They bear the name of the Federal Reserve Bank of New York, check letter "C," plate number indistinct. Workmanship is very poor; the counterfeit is easily observed upon examination.

Whiting Corporation

"How One Foundry Lowered Melting Costs" is the title of a circular issued by the Whiting Corporation, Harvey, Ill., describing its pneumatic charging machines and their operation with "No. 10" cupolas.

Chicago Conventions

The National Peanut Butter Manufacturers' Association will meet in Chicago in the Hotel Sherman, May 26-27. Biscuit & Crocker Manufacturers' Association of America will meet in the Drake Hotel, May 26-29; International Railway Fuel Association, May 26-29, Hotel Sherman; National Wholesale Grocers' Association, May 26-30, Congress Hotel; National Food Brokers' Association, May 29, Congress Hotel; Interscholastic Track Meet—High Schools and Academies, May 31, Stagg Field, University of Chicago.

Imaginary profits

that common cause of business deaths

HOW often have you seen statements of profit figured down to fractions of mills, but actually based on a number of vague estimates?

Probably the haziest of all such figures is steam cost, usually lumped in that elastic term "overhead." Without definite knowledge of steam cost, profits are fictional—and that is the inescapable reason for

4. *Faulty control of labor*—This refers to lack of effective employment methods, to unnecessarily high labor turnover, etc.

Other reasons for waste attributed largely to management are found in lack of cost control, lack of research activity, faulty sales policies, idle material and plants, etc. Attention is also called to lost production because of ill-health of workers and by industrial accidents. These are matters in which substantial progress has been made and in which the management, together with the Government and philanthropic institutions, must cooperate for further achievements.

Relative scarcity of labor, or fear of relative scarcity, will undoubtedly be an inducement to save man power by finding new ways to do things and by introducing labor-saving machinery. An impetus will be given to scientific research and chemical analysis, in order to achieve results by means of simpler methods. The discovery of the chrome tanning process, some years ago, is an illustration of this tendency. This process reduced the time necessary for tanning certain kinds of leather from months to hours and increased the output per man enormously. A better leather also resulted.

As for the introduction of labor-saving machinery, there is no doubt but that there are going to be great achievements in the future just as there have been in the past. But it is just as well to remember that the possibilities in some industries are much greater than in others. In flour milling, for example, it is difficult to imagine any revolutionary changes that will set free any great amount of labor. The number of men compared with volume of output is already very small, and practically the whole process has been reduced to machine operations. In the packing industry, there is still room for additional labor-saving devices, but the nature of the product is such that there is bound to be a large amount of hand labor that can never be supplanted by machinery.

Such great strides have been made in the use of machinery in textile mills that it is difficult to imagine any changes that will set free large numbers of workmen. The same is true, perhaps to a less extent, in shoe manufacture. The tanning of leather, on the other hand, although it will always require a great amount of hand labor, probably offers better possibilities. It is in the metal industries, in the manufacture of radio equipment, in automobile manufacture, etc., that the greatest strides have been made in recent years, and will be made in the future.

It would be interesting to figure out the factors that determine how far machinery is likely to supplant hand labor in the future. In the manufacture of metallic articles where standard, interchangeable parts are possible, there is a greater chance for the use of machinery than in the manufacture of ladies' hats and dresses, where the output is necessarily of infinite variety. The growing influence of styles militates against the use of machinery and increases the amount of hand labor. Ladies' shoes have gone into the millinery class during the past very few years, and a leading manufacturer recently told the writer that he can turn out only about half as many shoes with the same amount of labor and capital as he could when he was making staple shoes. About 75 per cent of his output now consists of fancy shoes.

Another factor affecting the use of machinery is the type of industry. There are three types,—first, the assembling, where various parts are manufactured and brought together into a finished whole; second, the processing industry, where each unit of raw material maintains its individual identity, and merely has various operations performed on it; and third, the disassembling type, where, as in the packing industry, the raw material is a highly developed unit that has to be broken up into various products of different kinds and sizes and consistency. The first type probably lends itself most readily to machine production; the processing type follows; and the breaking-up industry probably has to rely the most on hand labor.

One of the greatest possibilities for saving of hand labor in the future probably lies in the development of hydro-electric power. Possibly methods will be discovered to transmit power even greater distances.

OVERNMENT BONDS

. F. Childs & Company, in their June investment bulletin, state:

he recent buoyancy of the market for all Government securi- has been due to the timidity of Capital and lack of confidence ecting general political manoeuvers. Capital recoils from uring into enterprises which are sensitive to Congressional rference. The advance has been helped also by the reluctance ondholders to sell and pay taxes on their profit, or reinvest proceeds in other classes of securities.

Vhen industry slows down capital seeks a safe harbor until nay again be permitted to work unmolested and unafraid in iness undertakings. Consequently, idle money is temporarily ested in the safest of all securities—Government loans. There seldom an exception to this natural course of procedure. ernment Bonds, being in a class by themselves, move in an osite direction to stocks and corporation bonds. As a general om: Sell long-term bonds and buy short-term Notes when ney rates are low and prevailing prices are high, and con- sely, when money rates are relatively high and prevailing prices low, buy long-term bonds and sell short-term Notes. That oretical principle responds to every test and invariably proves e and profitable in practice. The gamble consists in deciding en to act. Similarly, when the price levels of the stock market ance, reflecting business prosperity, funds are withdrawn from vernment securities and reinvested in industry. Then the bond rket declines. Consequently, a rising bond market is often concomitant of a declining stock market.

The present market is typically a situation which is subject to ersal with the return of pronounced business activity. When nds are again sought for commercial purposes, we may expect renewed demand for stocks and a liquidation of all forms of vernment loans. Consequently, for temporary accommodation rposes, Banks and Corporations should properly select and ld short-term Government securities. However, long-term berty Bonds can reasonably advance to a considerably higher vel without being quoted above their relative worth as represent- g the current value of money. It is conceivable that the market ay soon be quoted at a 4% level which would be a price of 0.78 Seconds, 100.96 for Thirds, 101.92 for Fourths, and 103.77 r Treasurys, as of July 1st next, calculated to their earliest re- mption date. If quoted similarly to net 3¾% the price would approximately 101½ for Seconds, 102 for Thirds, 103⅞ for urths and 107¾ for Treasurys.

Continued from Page 7

real life that one gets on the stage are being reflected in the fice room, with more continuity and action.

This age of ours believes good office interiors can be turned out the same manner as Fords and Ivory Soap, that we can make expensive imitations of great French, Italian and English de- gns, producing the "atmosphere" of a J. P. Morgan office.

Every now and then a company moves into a new office. This ex- erience is like moving out of the smoke zone into the ozone. mployes do not stumble over each other any more in moving bout. Employes go through the same motions in their daily outine, but they mean more. Scratches on the old desks are ubbed with vaseline, furniture polish is applied, a new blotter ut on each desk, old furniture recreated in keeping with the new ffice "atmosphere." Potted plants are added, with lots of light nd air. Cleaning the rugs and putting up new window draperies end added charm. Everybody gets the new spirit. It is easier o work in such an environment, and it puts new life and zest into he place.

The day of the dark, dusty, dismal office is gone; it is not only nsightly and unpleasant to work in, but grossly inefficient. The nodern tendency leads us from these morbid conditions into more armonious color schemes, symmetrical lines, attractive finishes n metal furniture of utility, all of which lend added dignity to usiness men and women who work in such an environment. The atmosphere" of business offices builds business. It is the aes- hetics of industry.

hours in a convenient place, usually furnished by the plant management. Where it is desired by the men, the institution offers to conduct the meetings through its own lecture staff.

Along with the texts the men are furnished practical factory problems which they are to return with the solutions to the office of the institution within a stated time.

The chief advantage of such a course is that it combines the lecture method with individual study and teaching supervision. The texts are based on the best production methods taken from the experiences of many manufacturing plants in a variety of industries. The individual problems prove an incentive to thinking and initiative in tackling local management problems. The foremen develop a technique of their own for solving such problems. Since the study courses are supervised by plant executives, directly or indirectly, the outside educational institution is instrumental in training intelligent plant instructors, and that is something that is of more than temporary value to the plant management.

The plant management finances the course of study by advancing the cash payment per man, but later collects one half of the sum from the foreman. An arrangement generally entered into is to refund whatever payment the foreman made just as soon as he earns a certificate for satisfactory completion of the course, which means that in the long run the foreman pays nothing.

Whether conducted by an outside organization or by the plant management proper, the group study plan seems to be the most effective and the one in most common use. The foremen are formed into definite groups, either according to department, experience, study requirements, or to suit the personal convenience of the students. The group meets at definite intervals, either on company time or after the workday, and it is led either by a paid instructor or by a leader chosen from among the executives by the men or the management. The course is outlined and followed with a definite aim in view. Group study also involves some study on the outside, such as text reading, solving problems and applying specific rules to the job in the factory.

The methods of conducting groups differ, and it is for this reason that the Federal Board for Vocational Education has made efforts to effect some sort of standardization of group study and to assist the management to conduct such courses without outside assistance. A definite program of study was drawn up and tried out in a representative plant. The Federal Board for Vocational Education plan is flexible in its application to a variety of plants and industries. In fact it has been criticised on this point. In the words of one critic, "It is so free and easy in its methods that only the exceptional foremen can be brought to make the most of it." Sponsors of the plan defend it on the ground that it is merely an outline of a course to guide in the planning and management of groups in almost any industry, but that the detailed execution of the course and the application of the proper pedagogy are matters that rest with the management, the instructor and the group.

The Federal Board for Vocational Education outlined subject matter for eighty-two group meetings of two hours each. The foreman student is not called on to cover the entire ground, but only as much of the subject should be included in a single course to meet local requirements. The subject matter is therefore grouped in units. The Board suggests that each student give from four to six hours per week outside of meetings for completion of the work started in the class or group meeting. The outline serves as a guide for discussion by individual foremen. By following the plan it is possible for a group of foremen to conduct a definite course of study without outside leadership, except for supervision of the group by one who occupies the position of parliamentary chairman.

And then there is the group study plan executed entirely by the management, in which case the course of study is planned in its entirety by some one in the organization experienced in such work.

Whether the group study plan proves entirely successful is questioned by many, on the ground that one or two gifted foremen will monopolize the discussions at the expense of others who are not so responsive to discussion and yet need the training most. This can be overcome by proper planning and leadership and the choice of an experienced instructor or leader. This is a matter for the management to decide.

THE PICKET

HROUGHOUT the entire history of labor strikes the picket has played a ominent part. To him or her is com tted the task of keeping the strike alive. e picket's job is to patrol outside the emises of those against whom the strike is ected and, insofar as he can, see to it at no persons engage in work vacated by strikers. His presence is designed also squelch any growing desires among ikers to abandon the strike and return their old places of employment.

Pickets are usually selected because of eir known prowess in physical encounters d their disdain of law. Often they are ercenaries, acknowledging no allegiance the cause employing them but ready to mmit crime for a price. They are the ardians of the jobs vacated by the strikers the false assumption that they, the rikers, have a vested right in those jobs.

It is not necessary that pickets resort criminal assault upon those whose law l right it is to accept employment found nsatisfactory by others. Nor is it necesary that they employ abusive language or pply epithets to gain their ends. Their ery presence carries an implied threat nd often is sufficient to intimidate those ho would earn a livelihood at the above asks.

There is no denial of the moral or legal ight of persons, individually or collective y, to quit their places of employment for ny or no reason. By the same token it is he moral or legal right of the employer to mploy or discharge from employment, in he absence of contract, any person or per ons for any or no reason. These are basic principles of right and are so held by all the courts, English and American, Federal and State.

Judge McPherson, District Judge of the Federal Court, as far back as 1905, said: "There is and can be no such thing as peaceful picketing, any more than there can be chaste vulgarity, or peaceful mobbing, or lawful lynching.

"When men want to converse or persuade they do not organize a picket line. When they only want to see who are at work, they go and see and then leave, and disturb no one physically or mentally.

"The argument seems to be that anything short of physical violence is lawful; that men can be intimidated only when knocked down. The peaceful, law-abiding man can be intimidated by being compelled to pass by men known to be unfriendly. Such a man is just as much entitled to go and come in quiet, without even mental disturbance, as is the man afraid of no one and able with or without weapons to cope with all comers."

Picketing, therefore, in any form, is unlawful and may be enjoined—and being enjoined, if continued, constitutes contempt of law and is punishable at law. Those who are thus at fault, though their cases be appealed, must eventually suffer the consequence of their acts.

It is then that they crucify those persons and agencies who, remaining themselves free from the law, urge their followers in directions where their false sense of martyrdom sinks into a morass of regret and despondency.—*Employers' News.*

A NEW PAINT

Fifty per cent less heat from the sun will get through the top of an automobile if the top is painted with aluminum paint, the Bureau of Standards finds. The black materials generally used for the covers of automobiles and ice-wagons were found to absorb nearly ninety per cent of the sun's heat reaching them, and about half of this is reradiated as heat on the under side. Applied on the under side of thin metal roofs aluminum paint was found to cut in half the heat radiated on the under side as compared with surfaces of corroded metal or ordinary paints.

On tents and awnings aluminum paint was found to be still more effective. Fully 85 per cent of the sun heat that now gets through is found to be shut out by this simple method.

In the case of tents the paint is most effective when applied to the under side, especially if a white reflecting paint is used on top. For automobiles and ice wagons the Bureau recommends that the paint be applied to the top surface, especially where this is black. For roofs it can well be applied to the under side.

NEW ELECTRIC ENGINE

A new type electric locomotive, using oil for its fuel, the first of its kind ever manufactured in America, has been built jointly by the General Electric Company and the Ingersoll-Rand Company. This locomotive has been especially designed for switching service and will be given its first practical test by the New York Central in its freight yards at Eleventh street, New York City.

The power plant equipment consists of a 300 horsepower oil engine manufactured by the Ingersoll-Rand Company, directly connected to a 200 Kilowatt General Electric generator. The motive power consists of four HM-840 motors, one of which is geared to each of the four axles. The unit has a total weight of 60 tons on the drivers.

The General Electric Company has put about 90 self-propelled motor cars and locomotives using gasoline as fuel into service during the past 15 years, most of them still operating. The new unit is made up of tried apparatus as a result. It has been in use in the yards of the Ingersoll-Rand factory at Phillipsburg, N. J., for about four months.

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

GOOD MACHINERY MARKET

American manufacturers may look to northwestern India as a good future market for machinery. The Lloyd barrage project (formerly called the Sukkur barrage), primarily affects the Karachi district. Recently, American manufacturers have supplied five excavators of a total value approximating one-half million dollars, for use in the development. At least twenty concrete mixers have been recently imported, also other recent developments such as the construction of electric power stations and the working of stone quarries have influenced the importation of machinery.

Wheat grinding machinery is gaining in popular demand, owing to the fact that the natives have in recent years acquired a taste for wheat flour. A local machinery dealer in the Karachi consular district recently told the American consul he could easily dispose of 30 small flour mills operated by oil engines every month, provided a suitable and efficient machine of this type could be found. One popular type of flour mill is an open feed grinding machine of simple design which retails for about $225. The mills enjoying the greatest popularity among the Indian farmers are usually driven by kerosene or crude oil engines which are supplied separately. A typical 35-horsepower kerosene engine retails for approximately 6,000 rupees or about $1,700. The 50-horsepower engines of the crude oil type retail for about $2,750.

The market is said to be supplied with ice-making machinery at present. Lathes are frequently in demand, but the demand cannot be said to be steady. There is a natural demand for water-pumping machinery, medium and small sized units leading in popularity. Machinery for treating raw leather would also find a favorable market in this district.

New Plant for G-E

Increased business in the manufacture of switchboards is the reason given by the General Electric Company for the construction of a new building at their West Philadelphia plant, which will be occupied about July 15 by a force of 800 to 1,000 workers. The unit now under construction represents only one section of a possible expansion program which was begun a year ago. A million volt testing set, similar in design to that recently ordered by the Commonwealth Edison Company of Chicago will be installed in a specially constructed building in the West Philadelphia extension. This set will be used in connection with the manufacture and testing of high voltage oil circuit breakers. The General Electric Company has announced that no removal of switchboard development work from Schenectady is contemplated, and that the headquarters of the department will remain at Schenectady, where they are located at present.

"Movies" for Portland Cement

"The Story of Portland Cement" is the latest addition to the series of industrial motion picture films released by the Department of the Interior, through the Bureau of Mines. This film, which is one reel in length, has been prepared, in cooperation with the Portland Cement Association, in commemoration of the 100th anniversary of the invention of Portland cement in 1824.

Status of Illinois Coal Mines

A survey, completed by the Illinois Coal Operators' Association as of April 30, develops the fact that there were 397 potential coal producing mines in Illinois that within the past three years might directly or indirectly ship and that have shipped coal for a line haul by railroads

Of the 397, twenty-six have been definitely abandoned, and 112 closed indefinitely, the report states. These 138 mines, it is pointed out, constitute 35 per cent of the total shipping mines of the state, produced 21 per cent of the total state output during the last full year of operation, and employed 25 per cent of the miners.

"In view of the care exercised in determining mines 'closed indefinitely,'" the report says, "we feel convinced that few or none of those so shown will open for at least a year, and it is our opinion that a minimum of 60 per cent of them cannot and will not operate while the present wage scale and competitive condition is continued."

Darling Company Leases Space

The J. Frank Darling Company (New York) has leased 4,200 square feet at 2001 W. Pershing road, Chicago, for the warehousing of floor coverings.

Stolen Money

When the Granite City (Ill.) National Bank messenger was robbed of $63,000 on April 25, the loot included $3,900 in new $1 silver certificates, numbered A-18440001-B to A-18443900-B.

Don't Accept this Check

Banks have been notified by the Page Belting Company, Chicago, to be on their guard against checks purporting to be drawn against the company's "account" with the Lake View State Bank, Chicago, and "signed" by A. J. Wallis, treasurer. The company carries no account with the Lake View State Bank. Bad checks have been reported passed in this connection in Piqua and Columbus, O. All are numbered 592, payable for $60.

Atlantic Navigation Company

The Atlantic Navigation Corporation, 53 W. Jackson St., Chicago, announces sailings from New York for Santiago and Guantanamo, Cuba; Pt. Antonio, Annatto Bay, Pt. Maria, St. Ann's Bay and Montego Bay, Jamaica, every Thursday; for Nuevitas, Pastelillo, Pt. Tarafa and Manati, Cuba, every other Friday, and for Antilla, Banes and Gibara every other Thursday.

Harco Coal Sales Agency

The Harco Coal Company, a new corporation, has succeeded to the sales agency of "Harco" coal, formerly produced and marketed by the Harrisburg (Ill.) Colliery Company. The new company has also assumed the agency for "Panama" coal, produced by the Shoal Creek Coal Company, Montgomery County, Ill. General offices are in the Old Colony Building, Chicago.

Bates Takes Over Marine Line

The Bates Engine Works (Chicago) has taken over all of the patterns and designs formerly held by the Marine Iron Works. Manufacture of marine engines and machinery will be expanded.

AUSTRIA SEEKS FLOUR

Other Good Foreign Markets Open This Week

UROPEAN market for 4,000 tons of flour per year is open this week to readers of MANUFACTURERS NEWS. An Austrian merchant, who seeks to contract that amount, among the foreign buyers listed in the following list of current prospects.

ermany is in the market for $1,500 automobiles and machines of lower price. India ks dynamos and hardware. New Zealand wants calculating machines, office equipment l mortuary supplies. The Philippines are hunting second-hand logging cars, a loco- tive and three miles of second-hand relay rails.

onfidential information concerning any of these requests may be obtained by any man- cturer upon addressing MANUFACTURERS NEWS, indicating the serial number of the m desired. The complete list follows:

STRIA—
0265: Canned fruits, California. Beans. Flour, 4,000 tons a year. Lard. Peas.
0205: Machinery for breweries, distilleries, and yeast factories. Dairy machinery apparatus.
10242: Rosin. Sulphur.
10227: Surgical rubber goods.
LGIUM—
10246: Aniline colors, especially black.
10268: Tobaccos—Kentucky, Maryland, and Virginia.
AZIL—
10262: Zinc plates for photo engraving purposes.
ITISH WEST INDIES—
10256: Rails (T-rails) and accessories.
NADA—
10200: Tractors, lumber, 50 horsepower.
10260: Zirconium silicate, raw or prepared, and zirconium oxide.
BA—
10252: Cotton piece goods, low grade. Cotton plush shoddy or cotton waste, low grade.
10208: Rice cleaning and grading machines.
ECHOSLOVAKIA—
10229: Pharmaceutical preparations.
ENMARK—
10269: Banana meal.
GLAND—
10218: Cardboard or fiber board for making stock patterns.
10206: Engine lathes for turning small metal tubes in various patterns, also for knurling.
ANCE—
10219: Asbestos paper for electrolytic plants.
ERMANY—
10213: Automobiles, $1,500.
10247: Automobiles, medium and low priced.
10245: Acetic acid.
10251: Belting fabric, all widths, 500 to 1,000 pieces.
10241: Formaldehyde. Alcohol, methyl. Wood Naphtha.
10233: Rosin.
10244: Rosin.
10266: Semolina, durum wheat, fine granulated.
REECE—
10230: Capsules, gelatine. Sodas, effervescent.
HUNGARY—
10238: Caustic soda. Rosin.
INDIA—
10209: Dynamos for electric lighting.
10263: Hardware such as galvanized buckets, wire nails, hoes, pickaxes, saws, chains, and hinges.
IRELAND—
10201: Carriage wheels with hickory spokes and rims.
MEXICO—
10232: Aniline dyes—black, yellow, brown.
10204: Machines for spinning and weaving hard fibers and making rope.
NEW ZEALAND—
10222: Office equipment including stationery and duplicator supplies. Calculating machines.
10253: Tools and casket furnishings. Mortuary accessories.
PHILIPPINE ISLANDS—
10254: Locomotive and forty logging cars, secondhand. Rails, three miles of 40-pound relay rails (secondhand) and spikes, fish-plates, bolts, nuts, and split switches.
POLAND—
10216: Automobiles. Automobile accessories. Automobile tools. Roller bearings. Tires, automobile.
SOUTH AFRICA—
10220: Chair seats and backs of hard fiber. Veneer, three and five-ply, flat and curved.
10217: Milk bottle caps.
SPAIN—
10215: Automobiles, small, two seated.
10221: Radio apparatus.
SWITZERLAND—
10267: Cigars, Havana.
TRINIDAD—
10202: Match box making machinery.
URUGUAY—
10207: Machines for grinding bone for fertilizer, capacity of 10 to 15 tons a day, with gasoline engines.
YUGOSLAVIA—
10255: Tools, especially files and saw, high grade.

Northern Pacific Reduced Fares

Reduced fares to the National Dairy Show hich will be held in Milwaukee, Wis., from ptember 27 to October 4 are announced by A. Smith, passenger traffic manager of the North- n Pacific railway. The special rate will be le and one-third fare for the round trip. Chil- en of half fare age will be carried for half this nount. Tickets will be sold from September 26 October 4 and are good for the return trip ntil midnight October 7.

L. W. Smith Made Bank Director

Lloyd W. Smith, president of Harris, Forbes & ompany, investment bankers, New York, has en elected Director of the Harris Trust and avings Bank (Chicago).

Strike Oil at Peoria, Ill.

Oil has been struck at Peoria, Ill., according to word received this week. A well has spouted in Tazewell County, about a mile east of Peoria. It is understood to be producing five barrels a day. G. L. Avery, head of a company of business men, is drilling five miles North of the city.

New Western Office

The Buffalo Forge Co., Buffalo, N. Y., announces the opening on June 1, of a new western office at Seattle, Wash. The territory of this office will include the states of Oregon, Idaho and Montana in addition to that of Washington and the Territory of Alaska. Arthur T. Forsyth of the Buffalo plant will be western representative in charge.

ROYAL MAIL
The Comfort Route

PASSENGER AND FREIGHT SERVICE

Cabin Steamers to EUROPE

THE MODERN TREND IN TRAVEL—
The comfortable, well appointed cabin liner with its moderate priced accommodations—40% less than on express steamers—has opened a new era in European travel. People of moderate means, who have hesitated to visit the Old World because of expense, today are traveling by cabin liners.

To meet the ever increasing demand for this economical and agreeable transatlantic service, the Royal Mail now has four famous "O" steamers, the OHIO, ORCA, ORDUNA, ORBITA—a luxurious cabin liner fleet. Each of these splendid ships is noted for its delightful atmosphere, spacious cabins, broad promenade decks and excellent cuisine. An unsurpassed service at moderate cost, with sailings from New York to

CHERBOURG SOUTHAMPTON HAMBURG
PLYMOUTH BELFAST GREENOCK

PACIFIC LINE

Regular sailings from NEW YORK to SOUTH AMERICA (West Coast) via HAVANA and PANAMA CANAL. *Popular Steamers "EBRO" and "ESSEQUIBO" carry only first and third class passengers.*

Continued from Page 20

clean quartz crystals, which are of various sizes, are packed as densely as possible in a graphite or carbon crucible so that during the cracking of the crystals, which is bound to occur as the temperature is raised, the p cannot separate and allow any small amount of gas which may be present to enter the many crevices and thus form bubbles. These tightly packed crucibles are placed in a modified vacuum furnace and the temperature raised as quickly as possible to the melting point. During this fusion the pressure in the furnace is kept as low as possible. The time required for fusion will vary, of course, with the conditions and in all cases no more than 45 minutes is necessary. The energy rate of fusion is from 3 to 4 kilowatt hours per pound of quartz, and the loss of quartz due to volatilization is negligible compared with other charges. The result of this first fusion is a clear, transparent slug containing comparatively few bubbles ranging in size from a pin point to 2 or 3 mm. in diameter. Whether these bubbles have been formed by a gas or by silica vapour, it must be remembered that they have been formed at a temperature of about 1,800° C; and consequently their pressure at room temperature is very small. This slug is now placed in another graphite crucible which is suspended in a vertical carbon tube furnace. A graphite piston which just fits the crucible is placed on top of the fused quartz slugs and a weight is placed on top of a plunger attached to the piston. The slugs are again brought to a fusion the bubbles are largely collapsed and by the action of the weight, the quartz is extruded in the various forms, such as rods, tubes, ribbon, etc., which are shown. This material is practically free from bubbles, but because of limiting dimensions it may become necessary to re-work some of this, which is accomplished by the usual bench methods with an oxygen-illuminating gas flame.

"When it desired to obtain large blocks as free from bubbles as the tubing, cane and ribbon, another operation is necessary. As before, the quartz is fused in a vacuum furnace which, however, is also designed to withstand very high pressures. As soon as the material is fused the vacuum valve is closed and the pressure in the tank is now brought up to a pressure depending on the object in view, in less than a minute. This pressure collapses the bubbles and makes it possible to obtain very large slugs freer from bubbles than many kinds of the best optical glass.

"Previous attempts to reduce the bubbles by continued heating above the melting point resulted, after a certain stage, only in excessive loss of silica by volatilization. We have fused quartz at initial pressures of 600 lbs. per square inch atmospheric pressure, and less than ½ mm. of pressure. In the first case the mass was practically opaque; at atmospheric pressure it was considerably improved although much inferior to the present quality of quartz; and under vacuum conditions a large mass can be produced, as you can see, which from the standpoint of number of bubbles is very satisfactory.

"Not the least of the difficulties encountered in this development has been that in connection with the furnace equipment. The vacuum furnace in particular had to be greatly changed and enlarged with the result that we now have probably the largest vacuum furnace in daily use capable of operating at low pressures. Then, in addition to this the furnace had to be so constructed as to withstand repeatedly on the cover a total pressure of over 1,000,000 pounds (about 600 tons), and of course as the size of the furnace increases these difficulties are multiplied. Special attention must be paid to the design of resistor unit to the thermal insulation and even heat distribution,—to the cooling of the terminals and many other factors presented in the use of these two extremes in pressure.

"When the quartz crystal is heated between 500° and 600° it undergoes a remarkable physical change, cracking into small pieces sometimes with explosive violence. This is due to the difference of co-efficients of expansion along the two axes, subjecting the crystal thereby to great strain; and because of decrepitation owing to the presence of water and liquid carbon dioxide held in vast numbers of minute cavities throughout the crystal. The only advantage, therefore, in using large crystals for fusing lies in the greater ease of keeping the charge free from foreign material before the different particles begin to coalesce.

"Hereaus has heated crystal quartz in very small pieces, about the size of a nut, very slowly so that no cracking occurs and, consequently, no bubbles are included in the vitreous pieces. Herschkowitsch, on the other hand, has arrived at about the same result by accelerating the heating process so that a film of vitreous material is formed on the outside and prevents air from penetrating to the center, even though cracks may develop. As a matter of fact these processes, while interesting, are subject to very sensitive control and are impractical where large masses are to be fused.

"To obtain masses quite free from bubbles, it has been found best to raise the temperature rapidly to 1,400° or 1,500° at which point the pieces begin to coalesce. At about 1,750° C the quartz viscosity is high even though the temperature be well over 2,000° C. Vaporization of fused quartz is rapid at 1,600° C and at 1,750° C the loss due to evaporation is very great. Further increase in temperature results in on great gain in fluidity.

"The difficulties of obtaining perfectly homogeneous fused quartz free from striae, strain, bubbles, and double refraction must be apparent to anyone who has worked on this problem, and discouraging perhaps to those who have tried to buy such material. It is a little too early to state in what quantities such a product can be produced, but we have manufactured quartz of this quality which contained only two or three bubbles visible to the eye. This quality, however, has not as yet been placed on a commercial basis.

"The fact that for a great many purposes clear fused quartz can be used up to 1,000° C without injury; that its coefficient of thermal expansion is so small as to make it almost negligible; and that it will transmit light rays eveen into the extreme ultra-violet with very little absorption, gives to it a great utility value—not only to the scientist, but the manufacturer as well.

G-E Direct-Heat Units For Industrial Ovens

These units are 100% efficient in converting electric energy into heat that speeds production and reduces spoilage in japaning, drying and baking ovens.

G-E Direct-Heat Units are compact, easily installed and their flexibility makes possible the most desirable location of each individual heater.

The General Electric Company, in its work of perfecting the application of electric heat for industrial uses, developed this heater in which the ribbon is continuous, thereby reducing the number of mechanical connections to the minimum.

By combination of G-E Direct-Heat Units, your requirements for the utilization of electric heat over a wide and varying range can be met to your complete satisfaction. G-E Industrial Heating Specialists are at your service.

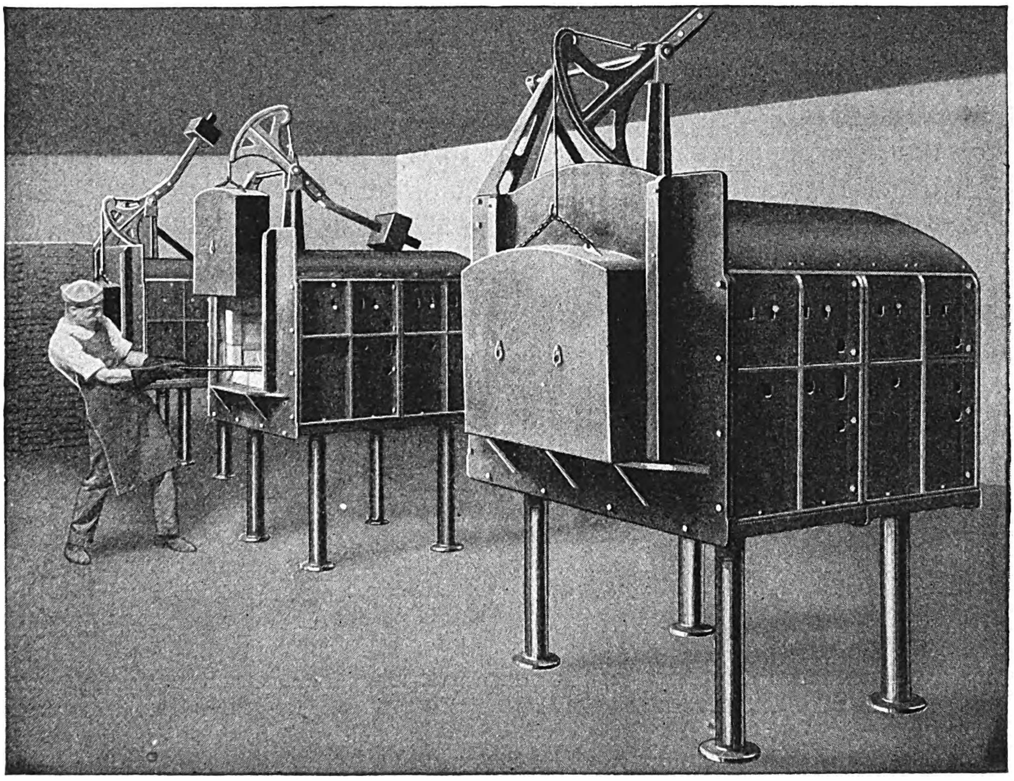
Manufacturers News is published every Saturday by Glenn & Company, 231 So. La Salle St., Chicago, Illinois. Subscription price $4.00 a year; 10 Cents a copy. Entered as second class matter March 4, 1912, at the Post Office at Chicago, Ill., under act of March 3, 1879.

Progressive Manufacturers Use ELECTRIC FURNACES

The Ideal Heat



At Lower Cost

An Even Heat at Any Temperature at Any Time

THE picture above shows three large "Westinghouse" Electric Furnaces. Ideal for carbonizing, annealing, hardening and tempering. When the perfect cycle of operation has been determined, it can be duplicated day after day and year after year. Production through these furnaces is not affected by careless workmen, uncertain fuel supply, chemical reactions or uneven heating. The furnaces are often used at the off-peak rate—this reduces the cost of operation.

Our engineers are at your service without the least obligation on your part. Electric heat has benefited other manufacturers in your line. Let us show you what it will do for you.

A Real Service Institution

Has it ever occurred to you that the actual cost of accidents that take place in your plant is only in a small way reflected in the annual premium or rate you pay for your compensation insurance?

The practical economy and advantages to the policyholders of a well managed Mutual Insurance Company are not only in the lower rate. We have some very interesting data we would be pleased to furnish to you without cost or obligation.

We feel sure the facts would prompt you to make a thorough investigation in the interest of your company and its employees.

HURLEY Thor Electric Washing Machine

Clothes washed by Thor last longer

Thor laundered clothes wear longer and appear fresher. When washed in dubious surroundings and handled by uninterested strangers they do not receive the care which gives them long life. A Thor in the home saves you many dollars and your wife many hours. It keeps your clothing free from contact with other washings and does away with expensive replacements of lost garments. Thor launders for you quickly, economically and efficiently. See it in operation today—you'll understand its superiority.

THE EAGLE'S SPHERE

. . . . . wants England supreme in air.
—RECENT NEWS ITEM

NAY! Let Britannia rule the ***waves,***
Her chosen realm of old;
The sea it was to Britain gave
Her mighty stores of gold.
Without supremacy o'er sea
No power she would bear;
Nay! Let Britannia rule the ***waves,***
The ***Eagle*** rule the air!

THERE is no England! England waits
Upon her colonies;
Australia and her other states,
Bound to her by the seas.
The seas Old England's province are;
They are the Lion's lair,
Aye! Let Britannia rule the waves,
The Eagle rule the air!

THEN bound about with triple chain
Of language, peace and power,
A Freedom and a Peace would reign;
And o'er the world would tower
America and Britain's threat
To every land: "Beware!
No war! Britannia rules the waves,
The Eagle rules the air!"

THE HOWELL-BARKLEY BILL

Is There No Better Way to Settle Labor Controversies Than to Fight Them Out?

By BEN W. HOOPER

Chairman of the United States Railroad Labor Board

THE great unorganized public, in all the walks of life and all the lines of business and industry, is overwhelmingly opposed to the idea that there is no better way to settle railroad labor controversies than to permit the immediate parties to fight them out. Their rest in the question is paramount and is entitled to supreme sideration.

hat the splendid body of men which operates the railroads of country shall enjoy the best wages and working conditions sistent with reason and justice should be a matter of great cern to all of us. The hazard of their employment and the l and responsibility with which they serve the people is omparable. The lives and property of the millions are dedent upon the fidelity and skill of the men in cab and coach, hop and office, at the telegraphic keyboard, and out upon the t-of-way. Theirs is an honored calling and, indeed, a public st.

nd yet, it is not conceivable that circumstances can hereafter se under which they will ever be justified in closing down rail- d transportation by a strike. The controversies of the future in ard to their wages and working conditions will involve nothing greater importance than an increase or decrease of wages or evision of some working rule. The margin between what they y ask and what they may legally and peacefully obtain will er be great enough to justify economic war upon the public will the threat of industrial warfare be necessary to obtain tice. There will never come a time under public supervision en a condition so burdensome will be sought to be imposed on railway employes for which no defense can be found except plunge the country into chaos.

ailway employes should never be placed in a position where y feel impelled to wring from a domineering and hard-boiled nagement just and reasonable conditions. It must be remem- ed that railway managements are subject to human frailties t as the employes are.

Settlements obtained by force command the confidence and re- ct of nobody. A reduction of wages brought about by a lock- leaves unhealable wounds in the minds of men. Just demands y be lost in a strike, and unjust ones may be won.

The success of a railway strike is measured by the amount of s and suffering it inflicts upon innocent people—producers, ppers, and consumers. If the perishable products of the farm, dairy and the orchard rot for lack of transportation, and if a ssenger train ditches and mangles its human cargo because of fective equipment or unskillful operation, these things are inted to as evidences of the effectiveness of the strike.

On one corner of this industrial triangle, we have two millions people who own the railroads and who have the selfish human desire to make money out of their operation. Congress would hardly be willing to let them exclusively draft a law for the regulation of the conduct of labor, the establishment of wages and working rules, and the prevention of strikes.

On another corner of the triangle is labor, two millions strong, well organized for the very human purpose of constantly bettering wages and working conditions, with a leadership devoted to the idea that the power to strike is, in the last analysis of the matter, the only weapon upon which they can safely depend. Congress could scarcely afford to manifest such a degree of optimism as to assume that labor alone would draft a law for its own regulation in connection with industrial controversies that would be fair to the carriers and to the people.

On the third corner of the triangle stands the great body of American people, 106,000,000 strong, with every business interest and activity, and with the preservation of physical lives of millions dependent, not periodically but daily, upon the continued operation of the railways. They can never permit either the managements or men, by lockout or strike, for any cause or reason, real or fancied, to throttle railway transportation. The law of self-preservation forbids. Those who enter upon the ownership and management of railroads and those who perform the responsible work of actual operation must alike realize that they are charged with a sacred trust to maintain this indispensable public service.

The public, in its eagerness to obtain the uninterrupted railway transportation rightfully due it, must not overlook its reciprocal obligation to both ownership and employes, but must offer to the one the opportunity of reasonable profit and must guarantee to the other just and reasonable wages and working conditions.

With the transportation machine quietly and efficiently furnishing adequate service, it would be quite human for the public to lapse into a state of smug indifference to the welfare and contentment of both the people who own the railroads and the folks who do the work. It is the function of organized labor to see that its interests are not neglected, and I believe it will be conceded that this function is well performed.

The labor organizations which sponsor the bill pending have stated that they were engaged 18 months in the preparation of the measure, and that this is the sixth draft of it. That these men of vast experience and life-long technical training in the science of labor controversy, with the cooperation of able legal advisers, have found it necessary to devote such infinite pains to the drafting and redrafting of this bill must impress us as uninitiated laymen with the difficulties inherent in this problem. May I also venture to suggest that it gives the public fair warning as to the amount of time and care which the 96 per cent who would be expected to live under this law should accord to the study of the proposal made to them by the less than 2 per cent. Let me hasten to say, however, that no criticism of the sponsors of this bill is implied. They have rendered a useful public service in the definite presentation of their views.

In discussing the merits of the Howell Bill it will be in point first to devote some consideration to the law which it is designed to supplant.

Title III of the Transportation Act, 1920, was the result of much thought and discussion in Congress. It received the bipartisan support of both republicans and democrats, and the approval of President Wilson. In a sense, it was a compromise measure, too weak to please some and too strong to suit others. It was not perfect, and its administration during a period of four years has served to bring out and emphasize both its good and bad points. Upon the whole, however, it was the greatest forward step that has been taken in our country and perhaps in all countries for the protection of the public against railway strikes and, at the same time, the conservation of the rights of both carriers and employes.

In appraising this law and the work of the Board which has functioned under it, the abnormality of times and conditions must be weighed.

There has never been a time in our history when there were as many industrial combustibles and explosives lying around loose and exposed in the railway business as there were at the termination of Federal control. The employes were dissatisfied with their wages, because an increase had been promised them and had been overdue for many months. Contrary to the prevalent public understanding, railroad employes, as a rule, had not received as high wages during the war as had labor in other industries.

On the other hand, railroad managements were quite generally disgruntled, because, as they claimed, the various classes of employes had been granted unreasonable, uneconomic, and burdensome rules and working conditions during the war, because new organizations of certain classes of employes had been forced on many railroads where such organizations had not existed before, increasing the danger of strikes, and because all these things were handed over to the roads as the unwelcome heritage of the war.

Whatever may have been the merit or the lack of it in these contentions, one thing is certain and that is that the whole question of wages and working conditions affecting every employe of every class on every railroad in the United States was thrown open and dumped on the desk of the Railroad Labor Board at one time. Highly technical schedules of rules from each class of employes. built up during a long term of years, some of them forced on carriers by strike threats, some of them forced on employes by the fear of lost jobs, and some of them the mushroom growth of the war, were concurrently, collectively, and vigorously thrust into the face of the Board with demands for revision, and counter demands for status quo or something better.

To add to the bedlam of this situation, general business conditions were fluctuating and uncertain. The cost of living refused to stand still or to travel consistently in any one direction, but persisted in zigzagging horizontally and vertically until the graphic charts of living costs and wages submitted to the Board by the fiendish statistical experts of both sides were crookeder than a Tennessee rail fence and made a man's two eyes feel like they were tied together in a hard knot.

While all this was in progress, the sun never set on a day when somebody in this grateful republic did not cuss the Board like a cabinet member. If wages were increased, other employers of labor passed resolutions to abolish the Board and the farmers roared about the increased freight rates. If wages were reduced, the employes bludgeoned the Board as a set of heartless hyenas, devoid of the milk of human kindness, grinders of the faces of the poor, and tools of the capitalists, it apparently being the understanding of many of the employes that a board of this kind was set up to increase, not decrease, wages.

When a carrier was hauled up for violating a decision of the Board, tons of propaganda were sent out to convince the populace that the Board was composed of a bunch of wall-eyed idiots for not being able to perceive that the carrier was a benevolent guardian of the employes when it deprived them of their legal rights.

After struggling with this situation 16 hours a day for three years, without pay for overtime, I feel like the Kentucky mou eer who had been left a widower with nine children to mo three kickin' cow-brutes to milk, a "crap" to tend, and a wrestling with the situation four months he said that he "cou rightly tell whether he was in a turrible nightmare or had d died and gone to hell for his sins, and didn't care which, neith

As has already been shown, the Board's calendar was no matter of gradual growth; it commenced business with an tremely congested docket.

From April 15, 1920, to April 1, 1924, 12,543 disputed qu tions were referred to the Railroad Labor Board. Of these 11 have been disposed of. Of the total number of disputes, 805 not reach the status of regularly docketed cases. The ca regularly docketed, as in a court, number 11,678. Of these, 10. have been disposed of. In some instances, cases involving th same general question of wages or rules were consolidated un one docket and decision number.

The foregoing certainly does not show that the Board has be slothful in its disposal of the questions submitted to it.

It is, of course true, as shown by Mr. Robertson, the spok man of the labor organizations, that many cases are still pending before the Board and that some of them were submitted qui awhile ago. This situation is due to several causes:

1. The enormous number of cases presented to the Board.

2. The fact that cases of major importance, such as wage and rules disputes, have been given precedence, and that these involved hundreds of millions of dollars and could not be hastily dispatched. A great majority of the cases remaining are grievance cases, each affecting the rights of a small number of employes. usually one. Right now, the Board is enjoying the first period it has ever had when no big, general questions of rules and wages were pending before it. As an evidence that this will enable it to expedite the cases on the calendar and remove the complaint. the fact is pointed to that during the month of March, the Board has closed by decisions 179 dockets.

3. The fact that some cases have been pending for a long time is further explained by the custom that the organizations have of pressing certain of their cases for preferential treatment out of their chronological order, presumably on account of their greater importance or urgency. Having accommodated the organizations by advancing cases, the Board should not be criticised for the necessary results.

4. Mr. Albert Phillips, the representative of Mr. Robertson's own organization,—Brotherhood of Locomotive Firemen and Enginemen—and a man of fine capabilities, had the misfortune. due to illness of himself and family, to be absent from the Board eight months out of twelve. This regrettable and unavoidable occurrence undoubtedly retarded in a large degree the work of the Board and particularly the cases of the train and engine employes.

5. It must be noted that there can never again be such a flood of disputes submitted to the Board.

Mr. Robertson makes the point that the law and the Board are failures because of the shop strike which occurred in 1922.

There are several observations that suggest themselves in relation to this statement.

1. The employes fought the anti-strike provision in 1920 and prevented its incorporation in the Transportation Act. Thi seemed to indicate that it was still their policy to strike when the failed by other means to obtain their demands, if they deeme such demands of sufficient importance.

2. There was no member of Congress in 1920 and no wel informed man in the country who believed the Transportatio Act would result in the absolute and total prevention of strike but it was believed that the Act would greatly reduce the numbe of strikes, and this it has done in two ways:

(a) By adjusting disputes economically, conveniently, an satisfactorily to the men.

(b) By making it practically impossible for any organizatio ever to win a strike over the decision of a tribunal up which all three parties are represented and before whic the disputants are fully heard.

3. The maintenance of way, signalmen, and clerks (on som

METHODS OF STUDY

Fifth Article on Training Factory Foremen

By J. K. NOVINS

All Rights Reserved

BEFORE the factory management can definitely outline a course of study for foremen it must settle to its satisfaction, and to the satisfaction of the men, a number of preliminary points. The first thing that occurs is the question, "On whose time should the ıction be given?" Should it be given on the company's time? d it be given solely on the time of the foremen? Or should ıanagement and the men share equally in the expenditure of on such instruction?

ving satisfied itself on this point there comes up the question e length of time that should be devoted to the instruction. ourse should have a definite purpose and aim and the length ne to realize the aim must be taken into consideration in ıce. Also, the length of the course will help settle the point who shall pay for it. Should the course last three months, ıonths, or a year?

e next question is, "Should the group conference be held a week, twice a week, or oftener, or should it be held once two weeks or once a month?"

e last, and by no means the least important, question is ere shall the group conference be held?" Should it be held where in the plant, or in some public place outside of the t? Should there be a regular meeting place, or should con- ıces be held wherever convenient at the time?

here the course of study is intensive and lasts a comparatively t time the tendency is to hold the group meeting on the com- 's time during the workday. This is especially true when foremen attending the conference are picked men, and the pany expects to derive immediate benefits from the training. ever, managements are now getting away from this tendency, the most popular arrangement at the present time is to hold erences after working hours.

raining foremen on company time is apt to prove more than an nditure of money to the company. It involves taking the fore- from their tasks, and most times it is very difficult to replace ı temporarily so as not to interfere with production in the respective department. However, there is a definite advantage in that the men appreciate all the more the training they receive and they therefore apply themselves more diligently to the studies. They realize that they must make definite returns to the company in the way of greater executive efficiency.

Where group conferences are held during the workday it is understood that the company furnishes the time. Where the conference is held after the workday it is understood that it is on the men's time. In solitary instances, the firm pays the worker overtime for time expended on group study.

Another element we must take into consideration is that conferences held during the workday are sometimes compulsory, while evening study is more likely to be voluntary on the part of the foreman. And then we must consider that the firm more often pays a half or the entire cost of a course supplied by an outside institution, and in addition the firm furnishes the meeting place, and sometimes a paid leader.

Another arrangement most firms enter in with the foremen students is to have the group conference meet in a hotel or restaurant, and if the plant is a very large one, in the plant cafeteria. Before the lecture and discussions, held on foremen's time, the firm treats the men to a supper. This has proven a satisfactory arrangement and serves to keep up the men's good spirits throughout the evening. In this way the study period proves less irksome.

Still another arrangement is for the firm to share the time-expense with the men. In that case the two-hour session begins at four o'clock and ends at six. Since the workday ends at five, the foremen will have consumed only one hour of the company's time, they furnishing the second hour. This has proven a satisfactory arrangement in some plants. However, it is not a common arrangement.

The length of the course depends chiefly on the special educational needs of the foremen in a particular branch of factory operation and organization. It also depends a good deal on the educational background of the foreman student. Broadly speak-

MACHINERY VS. MAN POWER

Continued from Last Week

By L. D. H. WELD

Commercial Research Department, Swift & Company

TO make this paper really interesting, I ought, perhaps, to mention some of the striking examples of labor-saving devices that have been introduced during recent years. But everybody has heard of such instances, and I am not going to bother with them. So much has been said and written along this line that perhaps we are going to be disappointed in the extent to which new inventions and new machinery are going to supplant labor in the future.

In the first place, it has already been pointed out that some industries do not lend themselves readily to machine operations. Furthermore, it must not be forgotten that there has always been a great incentive to reduce costs by introducing machine methods. *Revolutionary changes have already occurred*—when the steam engine was invented and later when electricity came into use. Seldom has there been a manufacturer who had such a monopoly that he has not been pressed by competitors to use the greatest possible ingenuity to develop more efficient methods. The incentive has been present at all times, and although restriction of immigration will undoubtedly increase this incentive, there is at least a chance that labor saving devices may not develop much more rapidly than they have in the past.

There are two principal ways in which the present labor supply can be more efficiently utilized. First, through a better distribution of the available supply; and second, through increasing the efficiency of the individual worker.

On the whole, labor is fairly mobile, and moves from one place to another in accordance with the demands in different parts of the country and in different industries. But there are limitations to this mobility, due to the expense of moving, the desire to stay in one place, and lack of definite knowledge of labor demands in other communities. At best, moving from one place to another involves hardship and lack of employment during the time of moving and the time necessary in finding a new job.

A good example of better utilization of available labor supply is found in the development of the cotton manufacturing industry in the South during recent years. In this case, the cotton industry has been able to make use of a large supply of white labor in the southern states which was more or less immobile, and which was not employed in the most productive manner.

Another instance of this phase of the subject is found in the migration of colored people from South to Northern manufacturing districts. During the war the packing industry was forced to use a good deal of colored labor in order to increase its production and to supply the needs of our allies, our armies at the front, and our home population. Undesirable as this movement is in some particulars, it is nevertheless a factor to be reckoned with. On the whole, colored labor is not very good for factory work, and there are only certain industries and certain operations in those industries where it can be employed. With relative labor shortage in the future, however, there is a strong probability that there will be still more migration of colored labor to the North, and that this class of labor can be trained to do work for which it is not now fitted.

Progress is being made in making it easier for labor to move from one locality to another. Seasonal industries, such as agriculture, offer difficult problems. Although continued progress through the means of public employment agencies and the activities of industrial managers themselves may be expected in the future, there is little likelihood of any quick and radical change in bringing about a more effective distribution of labor supply.

There are probably greater possibilities in the increasing of efficiency of individual workers. Ever since Frederick W. Taylor made his studies over twenty years ago, more and more attention has been given to time studies, job analysis, the setting of standards, and the encouragement of workers through premium a bonus systems of wage payment. Such studies have almost univ sally shown a very low efficiency of labor compared with w might reasonably be expected. Many manufacturers have b very successful in increasing human output, but the great majo of factory workers and manual laborers have not been affected b this movement.

Many obstacles are ahead in trying to increase human efficien The attitude of labor offers the principal obstacle. Labor believ in limiting the amount of work that each man shall do in a da Labor's point of view on this matter is due largely to the fallacio economic notion that there is only a certain amount of work to b done, and that unless the output per man is limited there won't b enough work to go round. Labor needs to be educated out of thi false notion. They must be shown that industrial and huma progress depends on an increased output of goods and servic for a given amount of labor. It is only in this way that th standard of living can be progressively raised. Here again progress is bound to be slow, although it must be realized th one of the greatest single possibilities for overcoming lab shortage in the future is to be found in increasing the efficien of individual laborers.

From the foregoing, it is apparent that there are many wa in which relative shortage of labor due to restriction of immigration may be overcome to a greater or less degree.

As to whether restricted immigration can be entirely overcome nobody can give a definite answer. It has been pointed out tha at least no revolutionary change can be expected, because ince tive to invent labor-saving machinery and to make manageme and labor more efficient have always been present in the past.

An interesting lesson along this line is derived from a study o the output per man in various industries as reported by the United States Census Bureau. A study of this point is necessarily limited to those industries for which the Census Bureau has obtained data on volume of output, because value figures are meaningless. There are probably many defects and inaccuracies in these figures, but some of them are striking enough to be usable.

For example, calling the output per wage earner engaged in industry for 1909, 100, the output per wage earner in blast furnaces was only 12 in 1879; it had increased to 55 in 1899. Since 1909 it increased to 119 in 1914, but dropped to 110 in 1919. In the boot and shoe industry, the output per wage earner increased from 73 in 1879 to 100 in 1899 and 100 in 1909. Since then, the change has been insignificant, because in 1919 it was 103. In petroleum refining, the output per wage earner increased from 20 in 1879 to 49 in 1899, and to 100 (our base) in 1909. Since then it has decreased to 72 in 1919.

There are many industries for which the Census reports output figures only for the past ten or fifteen years and some of these show a decreased output per man since 1909. In cotton manufactures, for example, output per wage earner increased from 10 in 1909 to 106 in 1914, but fell to 87 in 1919. Soap manufactur increased from 91 in 1904 to 100 in 1909 but had fallen to 82 in 1919. Lumber and timber products and the meat packing industry both show declines in output per wage earner since 1909.

From these fragmentary figures, it is obvious that the great increase in output per wage earner occurred previous to 19 and 1910. The war, together with careless management and inefficient labor during the great burst of prosperity in 1919 account for this set-back in industrial output per wage earner. For that reason, the year 1919 is not a fair one to use for comparative purposes. Since that year, as everybody knows, there has been a marked increase in labor efficiency. Swift & Company's output

STING—OR BE STUNG

The Sorry Situation in Washington

By JOHN M. TOWNSEND

Special Correspondent, MANUFACTURERS NEWS

TO bee or not to bee" is as vital a question in Washington today as when the melancholy Dane first thought of the best method to conserve the family honor and the state. He was getting ready to "sting" somebody but he concealed his purpose by leaving one off. Today the issue in Washington is whether President olidge will "sting" Congress with a few more vetoes; whether igress will retaliate by "stinging" the President with a few re votes to override his vetoes and whether the electorate this l is getting ready to "sting" one or both for what has happened Washington this Winter.

he present disposition tends toward acilly doing something before Congress adirns, but the approach toward definite islative results is from the ground occud by Congress toward what President olidge asked Congress to do last Decem-, rather than from the President's posin back to that of Congress. Compromise in the air and accomplished facts which inot be altered by this Congress point the probability that the President may ve to be content with half a loaf rather in a whole one if the tax and immigration ls are to become laws with his signature.

THE TAX COMPROMISE

When compared with the Mellon plan of x reduction proposed to Congress by the ministration last December, the conferce report on the tax reduction bill is a litical makeshift, unscientific, unreasonae and almost unworkable in many reects. Secretary Mellon cannot be blamed r denouncing it in comparison with his vn plan. In view of the fact, however, that is the best legislation which can be got out this political Congress and that further rmanent tax reduction legislation cannot had out of the next short session, the al question at issue here is: Is this tax ill better than existing law or not? That uestion can only be answered by its effect n the revenues of the government, by its fect on business and its political effect on ie country. The country is certainly ungry for tax reduction and every word spoken in favor of the lellon plan has increased that hunger. Now that the Mellon lan is dead for the time being, the tax reduction hunger remains nd the President must decide whether or not this tax bill, the iild of Congress, affords a few crusts for the taxpayer along that ne.

EFFECT ON REVENUES

Treasury estimates today fix the probable deficit next year as result of the work of Congress to date at approximately $450,-00,000. The surplus in the treasury at the end of this year, rovided Congress passes no more appropriation acts outside of he budget estimates, will be around $300,000,000, probably less han more. If Congress does not add to this burden the treasury night work itself out of this problem by savings and by increased evenues, provided the lower taxes carried in the tax bill will timulate business a little bit to make up the deficit. This is the esult of the survey made necessary by the passage of the bonus ict.

KEYNOTER

Photo by Underwood & Underwood.

Senator Pat Harrison of Mississippi has been chosen temporary chairman of the Democratic National Convention and will deliver the keynote address when the convention opens in New York on June 24.

Senator Harrison was named on the first ballot, and his election was unanimous.

EFFECT ON BUSINESS

Business, as a whole, wanted Congress to pass the Mellon plan. The recent recession in business has been due to disappointment that Congress balked and to uncertainties as to what tax law Congress would finally enact. The President will have ten days after the passage of the tax law to weigh its effect on business as well as on revenues, and Secretary Mellon has been asked to advise him of the merits of the new act as compared with existing tax laws rather than as to its demerits as compared with the original Mellon plan.

Reports that Secretary Mellon will resign are unfounded and so are reports that Secretary Hughes will resign, if the immigration bill with its Japanese exclusion feature is not vetoed. The President has stood manfully by both of his subordinates and is in no way responsible for the work of Congress. If there is any logic in the suggestion that the cabinet officers should resign because of something that has happened which the executive department could not help, then the President himself would be justified in resigning.

There is a considerable opinion in some administration quarters that if Congress had had some leeway in framing tax legislation at the outset instead of adopting the Mellon plan intact, there might have been a different result. Mr. Mellon proposed the strategy which was adopted and is as much responsible for the outcome as the President and Congress alone is responsible for the result. The job before the president and Mr. Mellon at this time, therefore, is to view the tax law of Congress from the standpoint of its effect on the welfare of the whole country, including business. If it will help business directly, or even indirectly by removing the present uncertainties, the President will probably sign it, provided it does not wreck the treasury.

POLITICAL EFFECT

Congress wants to adjourn with something accomplished. The members of both houses now know that this Congress is not a popular body with the country. The republican conferees on the tax bill had before them the alternative of bringing in a report which would command support in Congress and invite a Presidential signature or of framing a report which would be certain to invite a Presidential veto which could be sustained by republican votes in one or both houses. One certain way to do that was to agree to the senate amendments providing an increased corporation tax and full publicity for income tax returns. Senator Smoot busied himself on this subject and, after consulting the President and Secretary Mellon, reported back in favor of trying to create a report which could be approved both by Congress and the President.

If his guess was wrong and the President now vetoes the bill, the republicans in Congress will be trapped as between their desire to enact some kind of tax reduction legislation and their fear of overriding another Presidential veto on an administration policy. On the other hand, the democrats and progressives are prepared to amend a resolution granting a reduction of 25 per

YOUR HEALTH

WE are living longer in the United States. Regular physical examinations,—health checkups—have added from five to seven years to the life of the average person.

American industry and business leaders, citizens generally, fast are adopting the centuries-old medical policy of the cultured Chinese. They belong to the "keep well" club. They are paying their physicians for keeping themselves and their employes in good health. They are encouraging frequent physical examinations. All medical compensation in the future probably will be based upon preventive rather than curative treatment.

Life insurance companies years ago learned they could keep down death claims by insisting upon periodic health examinations on their program of preventive hygiene. One company has reduced the death rate by twenty-eight per cent. Fewer deaths are recorded from tuberculosis, typhoid fever, pneumonia, influenza and heart and kidney diseases. In ten years the white wage earners insured in one company have had their expectation of life increased from 45.61 years to 52.3 years. In 1923, there were 52,600 fewer deaths among industrial policy holders in this company than if the 1911 death rate had prevailed.

John D. Rockefeller and Henry Ford, the two richest men in the world, pay physicians for keeping them well. So do Samuel M. Vauclain, president of the Baldwin Locomotive Works and Charles M. Schwab, president of the Bethlehem Steel Works. A competent physician forms part of the regular staff of the White House. The health of the leading men of this country is under constant supervision by skillful physicians.

Importance of periodic health examinations has been recognized by industrial establishments for many years. It was the natural sequence to workmen's compensation under which employes receive stated sums for accidents and illness growing out of their employment. A man or woman in poor physical condition in a factory is a health and accident hazard to himself and his fellow employes.

"FAIR"

THE phrase "fair to organized labor," used so readily by union labor, evokes interest. Ordinarily the word "fair" means just and impartial. An analysis is in order.

If an employer buys the service of non-union labor he is as "unfair" to organized labor. It matters not that the man he employs is a proficient man, is master of his trade and has a wife and little ones to support. Under the present system of unionism, he must carry a card indicating that he has paid tribute to some labor organization or the employer is branded as "unfair" and draws upon himself a boycott of all organized labor advocates.

Usually, the unions bring pressure to bear on the employer to have the man discharged or force him to join the union. Either of these processes is called "fair." There is a certain class of employers that abjectly knuckles to union activities of this kind.

The expression "fair to organized labor" has come to mean unfair and unjust to the labor which constitutes 90 per cent of all labor. The threat of the boycott carries more weight than its results justify.

DON'T PAY NOW

In the case of Roberts and Schafer vs. Emmerson, Secretary of State, a decision was handed down at the February term of the Illinois Supreme Court finding the amendatory act of 1923, assessing the value of all no par value stock for the purposes of taxation at $100 a share, to be unconstitutional.

Shortly after the February term a petition for rehearing was filed which was granted at the April term. The Supreme Court now has this case again under advisement although the questions raised by the Attorney General in his petition touch more on the form than on the merits of the Supreme Court's opinion.

It is not thought that there is much likelihood that the Supreme Court will reverse its decision on the merits although some changes may be made in the phraseology.

The final decision will most likely be rendered before the twentieth of June, thus leaving plenty of time for Illinois manufacturers to make their payments no matter what may be the decision. Illinois manufacturers are therefore advised not to pay this tax on no par value shares until we have the opportunity to issue a further bulletin on the subject in June.

The franchise tax does not have to be paid until the end of the month of July for the ensuing year.

A LESSON

HEARST'S *Chicago Evening American* this week contained an editorial entitled—"Popular Government: A Little Lesson on Representing the People at Washington." It read:

> A member of the United States Senate is supposedly elected to represent the wishes of its constituency in that august body.
>
> Senator William B. McKinley represents Illinois in the Senate.
>
> The people of Illinois, when they were given the opportunity, voted about 4 to 1 in favor of the soldiers' bonus.
>
> Senator McKinley voted against the bonus in Monday's roll call.
>
> This concludes today's lesson in popular government.

This is one those "smart" editorials so popular with the unthinking citizen. Odds are that it was written by some member of the *American's* rewrite staff and not by a trained editorialist.

A member of the United States Senate is elected to represent the best interests of the United States. The American system of Government does not contemplate its Senators as the mouthpieces of the people, but as their leaders and law givers.

Senator William B. McKinley does not "represent Illinois" in the Senate. Mr. McKinley is the Senator *from* Illinois, a member of a body convened to represent the nation.

The people of Illinois voted for a soldiers' bonus. Illinois is a prosperous state, and already has its own soldier bonus. Illinois is one state out of forty-eight, just as the ex-service men of the country number 4,000,000 out of 110,000,000.

Senator McKinley, *as was his duty,* considered the question of soldiers' bonus as a United States Senator, not as an Illinois Senator. He was sent to Washington to use his own brains—not to take orders. *That* is the whole basis for the American form of Government.

The Senator from Illinois acted in what he believed to be the best interests of the United States. He voted against the bonus in Monday's roll call.

This concludes today's lesson in *American* Government.

BOTH TO BLAME

BOTH the United States and the Japanese Empire are to blame for the distressing situation rising out of the passage of the Act excluding the Japanese immigrants from the United States.

Both countries have acted with a deplorable lack of diplomacy. Their subsequent efforts to retrieve themselves in this respect provide the only pleasant features of an otherwise distasteful chapter in Japanese-American relations.

The Japanese Empire was unfortunate in its choice of words in protesting exclusion. Congress erred in taking action in a manner to say the least *not* calculated to assuage to any great extent the hurt entertained by our Eastern neighbor.

THE HUMAN ELEMENT

The Obligations of Employer and Workers in Successful Production

By ARTHUR H. YOUNG

Manager, Industrial Relations, International Harvester Company

THE human element in industry is the factor of greatest importance. Capital cannot exist without labor and labor without capital is helpless. The development of each is dependent upon the co-operation of the other. Confidence and good will are the foundation every successful enterprise, and these can be created only by uring a point of contact between employer and employe. They st seek to understand each other's problems, respect each other's inions, and maintain that unity of purpose and effort upon ich the very existence of the community which they constitute d the whole future of democratic civilization depend."

Are not these words that ring? Is not the truth that they state f-evident? Do not they tersely, yet vividly, declare the whole modern doctrine of enlightened and intelligent industrial relaons?

Many of you doubtless have read this document and can readily entify it and its authorship. To me a tremendous significance lent to the vigor and wisdom of this utterance by the fact that was written and published by the authorized representatives the great body of employing power and employing sentiment America. It was the outcome of long and earnest debate, the uit of thoughtful conference.

It is highly significant, I believe, that the largest employers of merica should voluntarily and in a time of comparative indusial peace, formulate and adopt an industrial relations platform nd program built upon and around such a declaration as that.

How fast and how far industrial America travels once it has ound the right road! I cannot help thinking how startling, how evolutionary, such an utterance and platform from such a source ould have seemed to most of us a dozen years ago. Now it seems, ven to the conservative industrial mind, nothing more than a clear nd concise statement of a vital industrial truth, a fundamental conomic fact.

There is one sentence which I would pick out of this declaration which is my text and drive deep into the consciousness of every man engaged in industry, whether he be employer or employe—the sentence which says: "The human element in industry is the factor of greatest importance." On those eleven words "hang all the law and the prophets" of the modern industrial gospel. They point and illumine the pathway toward, if not all the way, to an industrial relation which shall produce a more durable peace, a sounder progress and a truer prosperity than our peaceful, progressive, prosperous industrial America has yet enjoyed.

It will require no argument and few words to hook up my text and subject. They couple automatically. Successful production, the existence of the community, the future of our civilization demand a point of contact between employer and employe, from which shall come mutual understanding, mutual respect and mutual purpose and effort.

What and where was that point of contact up to a dozen years ago? It was the foreman—nobody and nowhere else.

What came from that point of contact in those days? Well, satisfactory production came from it, or else there was a new foreman on the job before long. I would hesitate to say what came from it to insure the existence of the community or the future of our civilization. That depended entirely on what kind of a human being the foreman was, aside from being a good production man. If he were wise and kind and quiet—a leader of men, not a Simon Legree in jumper and overalls—then he got successful production plus the higher but intangible by-products mentioned in our text.

But if he were the other kind of foreman—the kind that could and would and did fire a man because he didn't like the color of his hair, or because he couldn't pronounce his name, or because he had a cousin or a brother-in-law that needed a job—well, you might have gotten successful production from such a point of contact, but not much else.

And where is the point of contact today, under any workable system, expressing the modern theory of industrial relations? Why it is, in part, still in the foreman, but in a foreman who couldn't play the tyrant with even one man under him for one minute, and wouldn't if he could; and it is, in larger, higher part, in the idea and the mechanism of some kind of employe representation.

In a word, then, the phrase in our text, "A point of contact between employer and employe"—is practically synonymous with employe representation.

What are we getting from this new point of contact? We get insulation without isolation. We get from employe representation a living, humanized, vitalized and continuous contact. We get an understanding of the conditions we must meet, and the problems we must solve that is entirely mutual; we get a far better understanding by each side of what's on the other side's mind.

To illustrate: A few years ago, in a company that had only the old-fashioned point of contact, the superintendent and others connected with the management of a certain factory, were in conference with the company's officers. Among many other questions brought up was the labor situation at the plant. Oh, sure, it was fine! No demands or complaints, contented employes; everything serene and lovely. And inside of two weeks a strike broke upon that plant with the suddenness and fury of a mid-summer thunder storm. And the plant management had never known or suspected the trouble that had been brewing and fermenting for a long time right under their eyes and noses!

Out of the new point of contact we do get the unity of purpose, we do get the unity of effort that comes from mutual understanding, respect and confidence. I wonder if any thoughtful employer would care to abandon the new way and go back to the old.

After a while, when somebody writes or re-writes our industrial history, he cannot fail to note the remarkable transition which began to make itself rather generally felt about five years ago. We were then, as a nation, still engaged in our post-war orgy of spending and expanding. We were still busy pushing both production and prices to unheard of and unbelievable heights. You will remember, too, that it was a time of industrial ferment, industrial dissension, industrial warfare. I hardly need to recall to your minds the unpleasant things that came to pass between employer and employe in 1919.

It is said that the hour always produces the man, and that the need always brings the means. Glancing back at turbulent 1919, one is inclined to be more respectful toward these familiar sayings. Certainly that year and its events sharply accentuated the need for something better in the way of industrial relations than we had ever known before, and certainly the developments of that year began to meet that need. Already these developments have reached such a point and have brought such results that we may fairly call 1919 the beginning of the era of humanized industry.

Before that time, it is true, a number of earnest thinkers and students in our country had been pioneering the way to a better and sounder concept and practice of industrial relations, and a few conspicuous employers had experimented in various ways and with varying success with practical demonstrations of these

Continued on Page 26

Continued from Page 6

carriers) all voted and threatened strikes at the same time the shopmen struck, but the Transportation Act, 1920, and the Railroad Labor Board were directly instrumental in furnishing them a satisfactory way to avoid striking. The clerks did strike on two roads, but lost the strike and destroyed their organization on these roads.

4. In 1921 when the Board made its first reduction in wages, all the organizations voted to strike, but none struck because, in my judgment, they were quite fully convinced that the decision of the Board was so obviously fair, just, and conservative that public sentiment would make a strike suicidal. The train and engine employes at that time (October, 1921) came within about 36 hours of striking on a nation-wide scale on account of the wage reduction referred to. Some of their chiefs were kind enough to say in the public press—clippings of which I still treasure—that I saved them from the strike. In remembrance of this, they ought, without protest to this committee, to concede me the pleasure of slipping out about once every six months to make a speech in defense of the Supreme Court or in criticism of such laber leaders as have apparently tried to deliver railway employes into an alliance with socialism. The exercise of this occasional freedom does not detract from my admiration of the railway employes nor diminish my ability to hold evenly the scales of justice.

5. That this country would have been filled with successive strikes—some of them of great magnitude and destructiveness—had it not been for the work of the Board, no well-informed man can question. Both sides were determined to fight and they did fight, but as a rule they thrashed out their respective contentions before the Board like good American citizens, and stood loyally by the decisions.

The complaint is made by Mr. Robertson that the Board has adopted some unsound policies. The Board has doubtless made some mistakes, but I question the statement that it has adopted any unsound policies. Let us note in a condensed way the principal ones he mentions:

1. That the Board has held that the ability of a carrier to pay should in certain rare instances be given consideration in a secondary way in fixing wages. This was done, I believe, in three cases. There are still a few old-fashioned people in the world who believe that the wages paid in any industry must come out of its own revenues. If this is not true, the industry will not last long unless, of course, we have government ownership and the deficit can be passed on to the taxpayers which, we are beginning to understand, means everybody.

The Board was of the opinion that when the law commanded it to fix "just and reasonable" wages, it did not necessarily mean that all wages should be so standardized that the little jerk-water road struggling for life while it developed a new, raw country should pay the same wages as the big trunk lines. Of course, it will be conceded that if the standard wages on the big railroads were on the very edge of starvation, there would be no way to reduce them even a little bit for the struggling road, but that there is a good, generous margin between the standard railroad employes wage and privation is universally known.

The Board held, too, in these cases that the carrier's ability to pay could only be given secondary consideration, the first consideration being the sufficiency of the wage for the employe.

Really, this could hardly be termed a policy, but rather a few isolated exceptions to a general policy to the contrary.

2. It is complained that the Board adopted an unsound policy in failing to recognize the principle of "the living wage." As a matter of fact, the Board has never fixed a rate of pay for any employe that was not, in the common-sense acceptation, "a living wage," but it did insist that the measuring stick laid down by Congress for its use in establishing wages was the "just and reasonable" wage, a most flexible and comprehensive term within the bounds of which a board can find room to discharge every industrial and social duty to the employe.

The lowest figure presented to the Board as "the living wage" was $1,750 a year for common labor all over the United States which, with existing differentials maintained for skilled labor, would have created for the carrier an annual dificit of $2,241,639,518 on the basis of the revenues of 1921.

It is interesting to note a few of the statements made by the expert statisticians as to the immediate impracticability of the living wage, in view of the fact that they sought to have the Board declare in favor of the theory before they proceeded with the evidence and argument and then sent a telegraphic complaint to the President of the United States because the Board declined to make a formal, preliminary announcement of its adoption of the so-called principle.

Mr. Jett Lauck, perhaps Labor's most distinguished expert, after an exhaustive presentation of the merits of the "living wage," gave utterance on cross-examination to the following statements:

"The rate of pay at which you will arrive from the use of the budget would be appalling; that is, from the standpoint of a body which had determined to attempt to establish a minimum wage. That is the best (72-cent rate), but in our judgment it would be incapable of application at the present time, owing to the fact that the Board would not wish suddenly to inject a monkey wrench into the industrial wheels of the country."

Mr. Oliver, another statistical expert of the employes stated:

"It is now time to define a proper standard of living applicable in these proceedings. . . . Every answer is but a guess and a makeshift, and for our makeshift in these proceedings we shall accept the standard prescribed by the Bureau of Labor Statistics of the United States Department of Labor."

When this statement of Mr. Oliver's was read to Mr. Sturgis, another expert economist representing the employes, and he was asked if he subscribed to the thought, he answered, "I will subscribe to that; yes, sir."

Mr. Sturgis also said that "it is not practical to award the whole thing at one time," and that to do so "would be destructive."

A condensed analysis of the reasoning of those who sought to commit the Board to that very definite thing which they termed "the living wage" would read as follows:

1. That the law commanded a "just and reasonable wage."
2. That the wage could not be just and reasonable unless it were "the living wage."
3. That the living wage must be based on a scientific budget providing support in health and reasonable comfort for a family of five.
4. That the scientific budget, upon which they insisted, would cost 72 cents an hour for the lowest-paid common labor.
5. That this rate was so high that its adoption would be burdensome, impractical, "appalling" and "destructive"—a monkey wrench in the industrial machinery.
6. That therefore the Board must adopt, for the time being at least, a rate much lower than the just and reasonable wage commanded by the statute.

The Board took the position that if the living wage rate of pay were in fact the just and reasonable rate commanded by the law, the Board would violate its official oath by fixing the rate at any lower figure. The board was quite convinced, however, that a rate confessedly so excessive that its adoption would be ruinous was not just and reasonable, nor could the Board subscribe to a wage-fixing method which would produce such shockingly uneconomic results as to constrain its proponents to discount them.

The Board's action in issuing the resolution of July 3, 1922, in connection with the shop strike is criticised, but neither Mr. Robertson nor any other man has ever placed his finger on an unsound principle in that resolution. The resolution served several good purposes. It assisted in securing new employes to help run the railroads in the interest of the public. It doubtless contributed a great deal toward preventing other employes from being drawn into the strike. This was likewise a public service. It gave warning to the carriers not to take advantage of the situation and make arbitrary changes in wages and working conditions. This was in the interest of the employes themselves, and even such of the strikers as subsequently returned got the benefit of it. It reminded the new employes of their right to protect themselves under the Transportation Act by selecting those who should represent them.

INDUSTRIAL FIELD NOTES

nsolidated Navigation Company

Shipping Board consolidated service styled ısolidated Navigation Company has elected ı W. A. Blake as president. W. H. Stayton, imore Steamship Company, is chairman of ırd of directors; and W. F. Taylor, of the Transportation Company, is vice-president.

Holland-America Earnings

earnings of Holland-America Line for the 923 amounted to 2,740,705 guilders. The ny set aside 6,369,414 guilders, to be added reserves, for depreciation, etc. Interest s for the year totalled 1,882,285 guilders, a cash gain of 858,420 guilders. A deficit ıe year of 5,515,633 guilders, however, is after the setting aside of the 6,369,414 rs for reserves.

Columbia-Pacific Dividend

the annual meeting of the Columbia-Pacific ing Company, recently held in Portland, n, dividend of ten per cent was declared. All ompany's officers were reelected.

New Ships for West Indies Line

is reported that the New York & West Indies Steamship Company, 17 Battery Place, New , proposes to build several ships to be ıted under American registry in their service een New York and West Indian ports.

Barber Lines Outing June 3

ıe annual outing of the Barber Steamship s employes will be held on June 3rd at Vilie's Inn, Sheepshead Bay, New York.

New Office for Trans-Continental

r. K. H. Hinricks, General Manager of the ort Department of the Trans-Continental ight Co., with general offices in Chicago, ounces that a branch office has been opened 36 South 4th West St., Salt Lake City.

Three New Offices for Dollar Line

he Dollar Line has opened offices at 177 State eet, Boston; Bourse Building, Philadelphia; the Bessemer Building, Pittsburgh.

F. H. Prince Trustee

rederick H. Prince of Boston has succeeded gene V. R. Thayer, who resigned as trustee ril 19, 1924, as trustee of the Central Manuturing District of Chicago. Mr. Prince is sident of the Boston banking house of F. H. ince & Co., and also president of the Chicago nction Railways and Union Stock Yards Comny, the holding company, owning all of the ares of stock of the Union Stock Yard & Transit ., and the Chicago Junction Railway Co.

American Merchant Lines

J. H. Winchester & Co., Inc. (New York) opering the Winchester Lines, have taken over the nited States Lines' nine day express service tween New York and London, this new service ing known as the "American Merchant Lines," ith weekly sailings every Thursday. They will lso maintain service every two weeks from oston, Philadelphia, Hampton Roads and Baltiore to Hull and Leith. E. W. Green & Company, ill function as western agents for the American lerchant Lines, as for the Winchester Lines.

Kellogg-Mackay Company Moves

The Kellogg-Mackay Company, manufacturer f boilers, radiators, heating and pulmbing suplies, will move its factory and offices from 419 W. ighteenth st., Chicago, to the Central Manufacuring District of Chicago, where it has purchased pproximately 70,000 square feet of land. The ompany will occupy three new buildings.

Movies for Gasoline

"The Story of Gasoline" is the title of a new three-reel industrial motion picture film just released for public exhibition by the Department of the Interior, through the Bureau of Mines. The film, which was prepared in cooperation with the Standard Oil Company of Indiana, is designed to make plain to gasoline users the complex processes involved in the production and distribution of this product.

Adirondack Power & Light

The Adirondack Power & Light Corporation has sold $925,000 of First and Refunding Mortgage 6 Per Cent Gold bonds to the Harris Trust and Savings Bank (Chicago), Coffin & Burr, Inc., and E. H. Rollins & Sons. The Corporation does the entire electric light and power business in Schenectady and other communities in eastern and central New York. It also wholesales power in Albany, Troy and Utica and supplies gas in Schenectady and neighboring cities, serving directly or indirectly a population of approximately 700,000. The General Electric Company owns a substantial part of the common stock of this corporation. As officially reported for the twelve months ended April 30, 1924, gross earnings were $7,087,127 and net earnings were $2,403,378. Annual bond interest including this issue is $1,250,110. The bonds are due March 1, 1950, and are being offered at 100 and interest to yield 6 per cent.

World Winter Wheat Cut

Acreage planted to winter wheat in Europe last fall appears to be slightly in excess of last year's acreage, but the decrease in the United States more than offsets the increases in Europe, reports the United States Department of Agriculture in its monthly review of world crop conditions. Rye acreage outside Germany, so far as reported, is a little larger than last year. The area sown in Germany has not yet been estimated. Spring planting on the whole in Europe is about two weeks late. Winter cereals have been damaged somewhat in a few sections but for the most part have not been seriously damaged by cold wet weather during April. Condition of winter cereals in Europe generally is about average.

Maine Central Railroad

The Maine Central Railroad Company has sold $1,300,000 of Equipment Trust 5½ per cent Certificates to the Harris Trust and Savings Bank (Chicago), Kidder, Peabody & Co., R. L. Day & Co., and Estabrook & Co. These certificates are issued in part payment for new standard railway equipment reported to have cost $1,712,450. The title to the equipment is to be vested in the Trustee who will in turn lease the equipment to the Maine Central Railroad Company at a rental sufficient to pay the face amount of the Certificates and the dividend warrants as they mature: The certificates are due serially December 1, 1924, to 1939 and are being offered at prices to yield 4.75 to 5.40 per cent.

State of Missouri

A new issue of $3,600,000 State of Missouri 4½ per cent gold bonds, dated June 1, 1924, and due serially June 1, 1925, to June 1, 1944, is offered by First National Bank, New York, Dillon, Read & Co., Redmond & Co., and Phelps, Fenn & Co., at prices to yield from 4 per cent to 4.20 per cent depending on maturity. These bonds are issued to pay a bonus to the veterans of the World War.

Beg Your Pardon

In the May 17 issue of MANUFACTURERS NEWS, the author of "Unseen Costs," page 11, was given as Abbott W. Sherwood. The correct spelling is *Abbot W. Sherwood.*

New Mine Locomotive

The Department of the Interior, through the Bureau of Mines, has approved as permissible for use in gaseous mines a storage battery gathering locomotive built by the Mancha Storage Battery Locomotive Company, St. Louis, Mo. This locomotive is built in two forms, namely, with wheels inside of the frame and with wheels outside of the frame. The former is designated as "Hercules A-X" for truck gauges of 30 to 48 inches. The latter is known as the "regular" type, or "Hercules A" for gauges of 36 to 48 inches. Approval No. 1,505 covers both forms of locomotive. The locomotive has single end control and has a single motor with worm drive for each axle. Its weight complete is from 7 to 8 tons. The battery equipment available under the approval is as follows: 1. Exide battery—54 cells, 33 plate. 2. Philco battery—54 cells, 39 plate. 3. Edison battery—90 cells, type A-12. The new locomotive follows the same general design as the Mancha Hercules locomotive which was approved Nov. 13, 1922—Approval No. 1,502. The same design of headlight, headlight switch and headlight fuse compartments are used on both approved locomotives. The motor on the Hercules A and A-X locomotives was made somewhat larger and the capacity of the resistance considerably increased.

Cotton Spinning for April

The Department of Commerce announces that according to preliminary figures 37,745,967 cotton spinning spindles were in place in the United States on April 30, 1924, of which 31,871,665 were operated at some time during the month, compared with 32,392,171 for March, 32,683,786 for February, 33,339,806 for January, 34,044,870 for December, 34,101,452 for November and 35,512,737 for April, 1923. The aggregate number of active spindle hours reported for the month was 6,769,711,331. During April the normal time of operation was 25⅔ days, (allowance being made for the observance of Patriot's Day in some localities) compared with 26 days for March, 24⅔ for February, 26½ for January, 25 for December, and 25¼ for November. Based on an activity of 8.74 hours per day, the average number of spindles operated during April was 30,177,468 or at 79.9 per cent capacity on a single shift basis. This number compared with an average of 31,125,530 for March, 33,879,600 for February, 36,476,177 for January, 32,674,471 for December, 36,316,828 for November, and 40,727,208 for April, 1923. The average number of active spindle hours per spindle in place for the month was 179.

Auto Field in South Africa

Every year South Africa is becoming a greater field for the automobile business, according to Arthur Williams of the General Motors Export Company. Erection of dams and the building of irrigation systems have greatly broadened the trade field of South Africa during the past few years, he said. The raising of citrous fruits and cotton and the rapid development of the sugar industry have added greatly to the business of the country. These new activities have resulted in an increase in population and considerable road building. The greatest need of the country at the present time is additional capital to develop its many resources. Mr. Williams has headquarters at Johannesburg and has charge of sales in the entire African territory south of the equator.

New Furnace Company

The Bell Furnace and Manufacturing Company, Northville, Mich., has been incorporated for $40,000 by Edna L. Parker, Elmer L. Smith and F. S. Harmon.

Continued from Page 12

The resolution did not, as has so often been said, outlaw anybody.

The shop-craft organizations which struck have never been denied recognition by the Board, but the Board's decisions have enabled them to reinstate their organizations on several roads, a thing they could not have done without the Board. Only last week, the Board rendered a decision in favor of the shop crafts which denied to a carrier the right to discharge returned strikers because they had rejoined the organization. All of this not because the Board is trying to assist the shop crafts against the local shop associations, but because of its policy of absolute impartiality between organizations.

The statements that have been made in regard to the violations of the Board's decisions by carriers do not reflect the facts. It is entirely out of harmony with the record to say, in substance, that the carriers have, to any general extent, obeyed only the decisions favorable to them and ignored the unfavorable ones.

The great majority of the 201 Class 1 carriers have scrupulously obeyed the Board's decisions. The wages and rules fixed by the Board are almost universally effective.

The overdrawn statements on this subject are usually based on two fallacious propositions: First, all carriers that have been *charged* by the employes with violating a decision of the Board are enumerated as violators, and, second, all carriers that adopted a course in conflict with the Board's decisions are enumerated as violators although they may have subsequently conformed to the orders of the Board.

The only fair criterion by which this matter can be judged is the action of the Board under section 313 of the Transportation Act, which empowers the Board to investigate an alleged violation and to formally declare it to be such.

Up to April, 1924, four different Class I carriers and three short lines had been formally and officially declared by the Board to have violated its decisions. These roads are as follows:

CLASS I Carriers

Erie Railroad Company	14 violations
Pennsylvania Railroad System	3 violations
Chicago & Alton R. R. Company	1 violation
Fort Smith & Western Ry. Company	1 violation

Short Line Railroads

Duluth, Missabe & Northern Ry. Co.	1 violation
Interstate Railroad Co.	1 violation
Butler County Railroad Co.	1 violation

The carriers which have violated the decisions of the Board in the most persistent and hurtful way are the Pennsylvania and the Erie. The course adopted by these two carriers is not approved by other railroad managements.

Mr. Robertson's mention of the New York Central Railroad Company as a violator of the Board's decisions is erroneous.

In connection with this subject, Mr. Robertson does the Board a very inexcusable injustice when he seeks to leave the impression that the Board's limited powers have been more vigorously used against recalcitrant employees than the violating railroads. The Board, on the contrary, has utilized every atom of legal power and moral suasion at its command to make its decisions effective on all railroads and is well aware that its efforts, under the law, to direct public sentiment against violating carriers has occasionally seemed too harsh to them. The decisions of the Board will show that its arraignment of such carriers has been more severe than anything it has so far found it necessary to issue against employees. I will not burden the record with quotations, but can readily refer to the decisions.

If the employees can indicate wherein the Board has failed to make use of any means within the law for enforcing its decisions, the Board will avail itself of the information and, if Congress will increase the Board's powers, they will be properly and legally executed.

The statement that there is widespread dissatisfaction among the employees with the Railroad Labor Board is correct in one sense and incorrect in another.

That the work of the Board has been beneficial to the emp is recognized by a large percentage of them, but it would re courage for them to make public admission of the fact, be their chiefs are seeking the abolition of the Board. There w be few, if any, men who represent the organizations in pres cases to the Board who would subscribe to the statement tha attitude of the public group is not fair and judicial.

The whole truth of the matter is that most of the leaders the organizations are so strongly opposed to the theory upon wh the labor section of the Transportation Act, 1920, is predica that they have never been able to assume a fair attitude tow the Board. They opposed the enactment of this provision a have fought it unceasingly ever since. If they had been conten to go along with the law and the Board, and occasionally to s a good word for the Board to their membership when it had re dered decisions of great importance and benefit to the men. th sentiment among employees would have been vastly differe But from the hour the law went into effect no opportunity has ev been lost by these leaders to belabor the Board and the law t their membership. The resolutions of the train and enginema heretofore read into the record, asking Congress to repeal th present law, contained the significant statement "that the fault li with the plan or system probably more so than with the personn of the Board."

In order to destroy the law, it was deemed necessary to fight the Board. No man can serve on any kind of Board that deals with labor disputes and expect to escape the most violent criticism if he assumes an independent and unbiased attitude, lives up to his oath of office, and shows symptoms of the possession of guts.

The Railroad Labor Board has rendered decision after decision sustaining the right of collective bargaining, protesting labor organizations against powerful assaults aimed at their destruction upholding their rights of conference and negotiation, and, in fact maintaining the principles most vital and sacred to labor, but only the scantiest of reference, if any at all, is ever made to these things.

A few days ago, I read in a copy of the *Railway Clerks Magazine* a refreshing little statement, even guarded as it was. I quote it as follows:

> "Some good has undoubtedly been accomplished by the Labor Board functioning under the provisions of the Transportation Act. During the readjustment period following the return of the railroads to private operation there perhaps would have been more trouble between the carriers and employees had there been no Board. It is probable that some of the carriers that have been so diligent in breaking up unions would have been more successful had it not been for the intervention of the Labor Board. It is not with the thought of destroying whatever good has resulted to both carriers and employees from existing legislation that the change is proposed but to substitute something better."

In the same magazine appeared the following editorial:

> *** *The Board has become a deterrent to the natural economic pow of an organized group of workers.* It has also at times acted as a deterrent against hard-boiled managers to the advantage of the workers. especially among the groups not well organized, preventing wage reductions and the imposition of unfair working conditions.*** But granting that the Board has established rates for certain groups of unorganized or poorly organized employees that are higher in some instances than might have obtained otherwise, that kind of a paternalistic policy will not benefit the wage earners in the long run. The same group of workers solidly organized could hav secured more than they received at the hands of the Board.

Although this magazine is always full of criticisms of the Rail road Labor Board, here in the paragraphs quoted, the bright bu partisan young editor loosens up and confides the whole inward ness of the situation in connection with this legislation. He say in effect: "The Labor Board has been a right good old Board It has protected the weak against the strong. It has saved th country trouble during the readjustment period. But it stand in the way of the exercise of our *natural economic power*, that i our power to strike and tie up the country's transportation."

The main, outstanding, over-shadowing purpose of the Howe Bill is to make it easier for railway employees to enforce the demands by strikes and, to this end, to exclude the public from a influential participation in or supervision over the adjustment o labor controversies. The enactment of this measure would co

Continued on Page 16

INDUSTRIAL FIELD NOTES—Continued

Credit Men Elect Officers

t the annual election of The Chicago Associ·n of Credit Men the following officers were ted:

resident—J. M. Judson, Sinclair Refining npany;
irst Vice President—E. H. Burgess, Edward ies Lumber Company;
econd Vice President—A. H. Fabbri, North·stern Expanded Metal Co.;
reasurer—F. M. Forrey, Continental & Comrcial National Bank.

New York Hotels in June

There will be adequate hotel accommodations in w York for all who attend the Democratic Naoal Convention this June, according to the Hotel sociation of New York City, which promises adeate facilities likewise for business men and ir representatives who contemplate being in w York on business during the month. It is ggested, however, that hotel reservations for the nvention period be made now and addressed the room bureau of the association.

Price-Anderson Consolidate

Ed. V. Price & Company, wholesale tailors, icago, have taken over the business of A. E. nderson & Company for fourteen years located 407 S. Green st. Anderson & Company have oved to the fourth floor of the Price Building at arket and Van Buren sts. Separate sales ornizations will be maintained with Fred W. Hann as general manager and Arthur L. Anderson woolen buyer.

Gold and Silver Imports

The Netherlands provided the United States ith the most gold during April according to the nited States Department of Commerce. Gold mported from the Netherlands during April mounted to $21,145,536. England ranked next ith $14,292,179, and Canada third with $4,041,68. The Philippines were fourth with $3,096,761. Mexico provided the most silver for the month, otal imports being valued at $2,721,520. Canada anked second with $637,245.

Ruda Manufacturing Company

Henry Sonnenschein, Louis A. Ruda and Hugo oewy have incorporated the Ruda Manufacturing ompany, 2306 S. Kedzie av., Chicago, $250,000 o manufacture sashes, doors, frames and windows.

New Drug Firm

Edward Park, Edward Fleming and John C. Longbehn have incorporated the Australian Laboratories, 172 W. North av., Chicago, for $10,000. The new firm will deal in drugs.

Domestic Exports, Meats and Fats

Domestic exports of meats and fats for the ten months ended April, 1924, show large increases over those for the same period ending April, 1923. The increase in total meats was approximately 17 per cent, while an increase in animal oils and fats amounting to 10 per cent was recorded. Such increases were due to increased demand for pork products from the United Kingdom and Central Europe. Average export value of meat products for the ten months ending April, 1923, amounting to 15.95 cents per pound declined for the period ending April, 1924, to 13.78 cents per pound. On the other hand, the export value of animal oils and fats which for the ten months period ending April, 1923, amounted to 11.83 cents per pound, increased for the period ending April, 1924, to 12.39 per pound.

New Service on R. I.

Three trains a day between St. Louis and Kansas City, Colorado Springs and Denver is announced by the Rock Island Railroad.

Costumes and Scenery

Roy Mack Inc., 177 N. State st., Chicago, will deal in theatrical costumes and scenery. Roy Mack, Harry Roberts and Frank Berger have incorporated for $10,000.

Simpson Heads Montana Stockmen

Charles M. Simpson of Volborg, Montana, was elected president of the Montana Stock Growers Association at the meeting in Dillon, April 24 and 25, to succeed the late John Burke.

New Drivers—Higher Bills

Labor turnover is a more important factor to operators of motor trucks than to virtually any other line of business, according to officials of the General Motors Truck Company, Pontiac, Mich. An investigation disclosed that changing truck masters (drivers) almost without exception results in higher repair bills and operating costs.

North Western R. R. Appointments

At a meeting of the board of directors of the Chicago & North Western Railway Company held in New York on May 13, official appointments, effective May 15, were approved, as follows:

Marvin Hughitt, Jr., Executive Vice President; Frank Walters, Vice President in Charge of Operation; William Walliser, Vice President in Charge of Personnel; F. H. Hammill, General Manager; G. B. Vilas, Assistant General Manager; B. E. Terpning, General Superintendent.

Southwest Power

A new issue of $2,100,000 Southwest Power Company first mortgage gold bonds, series "A" 6½ per cent sinking fund is offered at 97¼ and accrued interest to yield over 6.75 per cent by A. C. Allyn and Company, Arthur Perry & Co., and West & Co. The bonds are dated May 1, 1924 and due May 1, 1944.

The company has been organized to acquire the properties of Coal District Power Company and Choctaw Power & Light Company, and will supply electric light and power in nineteen communities in Oklahoma and Arkansas. The consolidated earnings of the properties to be presently acquired by the Southwest Power Company and of the properties of such subsidiary, for the two years ended February 29, 1924 show net earnings over twice annual bond interest.

Fisheries of Holland

Holland's fishing industry showed a small improvement in 1923 as compared with the previous year. The total catch of the sea and coast fisheries in 1923 was 154,543 tons, valued at $8,680,000, as against 129,200 tons of $7,920,000 in 1922. Holland exported in 1923 for a value of $6,912,000 compared with $6,222,000 in 1922. Increased exports to Germany during the latter part of 1923 are responsible for the increase in the total. The following countries, in the order of their total purchases, imported Holland's fish and fish products in 1923:—Belgium, Great Britain, Germany, France, United States, Dutch East Indies, Sweden and Norway.

Building Drops 12 Per Cent

Reports of the volume of building permits and plans filed in April in important cities and towns throughout the country give evidence of the approach of activities which will more adequately reflect normal demand. April totals in 333 cities were $337,822,461 compared with $361,849,492 in April, 1923, a loss of $24,027,031 or 7 per cent, according to the national monthly building survey of S. W. Straus & Co. With the elimination of New York City, where the volume of plans filed was excessive, the country as a whole lost nearly 12 per cent compared with April, 1923. This exhibit of losses is in sharp contrast with 1923 conditions, for April of that year showed a gain over 1922 of more than 50 per cent.

Electric Brass Melting

In the electric brass melting field, the United States has attained a tremendous lead over all foreign countries, according to a report just made public by the Department of the Interior, through the Bureau of Mines. Whereas in the United States there are about 540 active electric furnaces doing commercial non-ferrous melting, it is doubtful whether all foreign countries combined use 100 electric brass furnaces. Of the American furnaces, about 275 are induction furnaces, about 135 are moving indirect arc furnaces, 80 are Baily furnaces, while the remaining 50 furnaces are of various types. The possibilities and limitations of the electric brass furnace are becoming better understood, the Bureau of Mines declares. The increase in the number of furnaces installed indicates that the growth is likely to continue, and that the electric furnace is of decided use to the non-ferrous metal industry. No radically new types of electric brass furnaces have been introduced in the United States in the last two years. The outstanding developments are the continued increase in the use of the induction and the rocking-arc types, and the lack of increase of less efficient types such as the granular-resistor and the muffled-arc types. The popularity of the two chief types has been attained because both are efficient, both give lower metal losses than fuel-fired furnaces, and both stir the metal so as to give perfect mixing.

Freight Claim Division Meets

The Freight Claim Division of the American Railway Association will meet in Chicago during the first week of June. This will bring to Chicago the freight claim representatives of practically all of the transportation companies in the United States and Canada. This meeting illustrates the progress which is being made by the railroads in handling their relations with the public, as Chas. H. Dietrich, Freight Claim Agent, Chicago, Milwaukee, & St. Paul Railroad, announces that one day will be set aside and the public invited to participate in the discussion with a view of offering the freight claim agents any suggestion or constructive criticism which may improve and make more pleasant this part of the transportation service.

Growth in Exports

Exports of domestic manufactures from the United States in the fiscal year 1924 which ends with next month will materially exceed those of the fiscal years 1923 or 1922. While they will not of course equal those during or immediately following the war they will apparently exceed those of the fiscal year 1923 by about $200,000,000, and those of the fiscal year 1922 by more than $400,000,000, and will also be much greater than in any year preceding the war. The latest figures on the exports of manufactures, says the Trade Record of The National City Bank of New York, shows that the exportation of the two great groups "manufactures ready for consumption" and "manufactures for further use in manufacturing" aggregated $1,564,000,000 in the 9 months ending with March 1924, against but $1,344,000,000 in the same months of the preceding year, and if they continue at the same rate during the remaining three months of the current fiscal year they will aggregate about $2,086,000,000 for the fiscal year 1924 against $1,883,000,000 in the fiscal year 1923, and $1,623,000,000 in 1922.

Report Boosts Graver Corp.

Graver Corporation, East Chicago, Indiana, has issued in booklet form the report of an investigation made by the A. C. Nielsen Co., of the *Graver Hot Process Softener* in use by the Independent Pneumatic Tool Co., Aurora, Ill. The report shows that the *Hot Process Softener* is saving annually $6,810.25 in coal and labor, an annual return of over 100 per cent on the investment. A tabulated cost and saving statement is included.

Continued from Page 14

stitute the longest step backward that has ever been taken in Federal legislation. In my humble opinion, it would prove a curse to the public, the railroads, and the employees.

According to the authoritative quotations above given, it would denature the present law, eliminating from it the power which it admittedly contains to deter domineering managements from tyrannizing over their employes and to deter organized employes from enforcing their demands by trampling the public under foot.

The present Transportation Act asserts the right of the producers, shippers, and consumers to a voice in the adjustment of railway labor controversies with a two-fold end in view: First, that strikes may be prevented, and, second, that railway managements may not be dragooned by violence or the threat of it into yielding to unconscionable demands the financial burden of which will be transferred to the shoulders and backs of all other people, including labor itself in other industries. The people of the United States do not want the railway industry to get into the condition in which the coal industry is popularly believed to be, where force and collusion have combined to destroy public confidence in all wage agreements and, consequently, in the fairness of the prices the people pay for coal.

Now let me give what I consider a close-up view of the Howell Bill.

1. It wipes out a board composed of equal representation of the carriers, the employees, and the public, and having jurisdiction of all labor controversies, and substitutes therefor four adjustment boards having jurisdiction of grievances only.

2. It establishes no board or tribunal with jurisdiction of the big fundamental questions of wages and working conditions—the questions which usually provoke strikes.

3. It is true that it provides for arbitration boards to pass upon questions of wages and working conditions, but the submission of a dispute to an arbitration board is purely voluntary on both sides, and the bill leaves the implication that no odium would attach to either party for refusing to arbitrate.

4. It sets up a Board of Mediation and Conciliation, composed of five members, without any power to pass upon disputes, but with power to mediate and conciliate.

This Board of Mediation is also empowered to appoint the "balance-of-power" member or members on arbitration boards.

5. The most remarkable evidence of the purpose to completely exclude the public from participation in the adjustment of controversies is shown in the provision covering the eligibility and appointment of the members of the Board of Mediation and Conciliation. Instead of including an express provision making the partisans of the carriers and the employees both ineligible to membership on this Board, there is an express provision making them eligible. In fact, the eligibility of members of the Board of Mediation and Conciliation is identical with the eligibility of the representatives of the carrier and the employees on the present Railroad Labor Board. This provision in a bill which has been carefully redrafted six times by experts means that the employees have deliberately planned to seek membership on such Board of Mediation and Conciliation, if it should ever be created, and it is my information that certain employees are already aspirants for such appointments.

Of course, if the President appointed one of them on the Board, he would have to strike a balance by appointing a representative of the carrier and the result would be either a tripartisan board or another bipartisan board similar to the adjustment boards. In either event, the usefulness of the Board would be absolutely destroyed both for mediation and for the appointment of arbitration.

6. The operations of these adjustment boards and the Board of Mediation and Conciliation are conducted without publicity and, when their efforts fail and a strike is threatened or results, the public has no authoritative way in which to acquaint itself with the facts upon which a potent public opinion can be predicated.

7. The Howell Bill attempts the undemocratic and un-American thing of confining representation on the adjustment boards to certain labor organizations and excludes many other rival organizations. The constitutionality of such a discrimination might well be doubted. Certainly it is not in keeping with our ideas of freedom.

The favored organizations are as definitely designated by description as they could be by name. A previous draft of the bill set them out by name, but legal advice doubtless softened and camouflaged this crude injustice.

The history of this country shows that labor organizations are not permanent, but are subject to change. The Railroad Labor Board has established the American plan of permitting the employees to settle by secret ballot their choice of representation.

It must be remembered, too, that the carriers have not yet been consolidated and that under the law each of them makes agreements with its own employees.

8. Under the bill there would be a new arbitration board for each new dispute. The nonpartisan member of these boards would be likely to be without experience and would function under great disadvantages. It would be difficult to secure the services of satisfactory men who could devote the time necessary to the study and disposition of such technical and unfamiliar matters. This has always been one of the unsatisfactory features of such arbitrations.

The present law provides a more workable scheme by setting up a permanent board upon which there will always be experienced public members, as well as technically trained men from both sides of the dispute.

There need be no fear that the parties will cease to refer their disputes to a permanent board. Naturally, precedents will be established on many matters of detail that will discourage the submission over and again of the same dispute. It is advantageous to all parties that such a stabilizing process should take place.

As to the revision of rules, this is a matter of growth and development just like the laws of a state, and a permanent board would always be responsive to this idea.

Disputes as to changes in rates of pay are always new cases, and the requests are based on new conditions. Disputes are still coming to the Railroad Labor Board at the rate of about 50 per month.

9. The whole machinery of the bill is cumbersome, complicated, and expensive. Instead of a board with nine members, drawing aggregate salaries of $90,000 per year, it sets up five boards of 45 members, drawing aggregate salaries of $340,000 per year, with provisions for all the independent overhead expenses for each board that are now authorized for the Railroad Labor Board.

On top of this would come the great expenses of arbitration boards, the salary of an arbitrator not being set, but, in a former draft of the bill, fixed at the rate of $25,000 per year.

10. Many other details might be mentioned, but let us close them by calling attention to the truly remarkable composite effect of the measure.

It legalizes the perpetuation of every rate of pay and every working rule now in existence. Not one of them could ever be changed by or for a carrier, regardless of what unexpected changes might take place in conditions, unless such revision were made by an arbitration board and no such arbitration could be held without consent of the employees.

Under the present law, the Railroad Labor Board has ruled, in effect, that a carrier must not arbitrarily revise rules or reduce rates of pay, but the Board is always open to hear a petition either for an increase or a decrease and the opposing party does not have to consent to the hearing.

It would not be difficult for me to point out certain defects in the present law that could be remedied by amendment, the effect of which would be to further guarantee the rights of the employees and make the law bear somewhat more equally upon the two parties.

It would never occur to me, however, to demolish the present law and substitute for it a measure so partisan in its nature, so destitute of all protection of the public, and so certain to transform the present peaceful conditions into disorganization and discord as would the pending measure.

The employees are correct in their contention that the failure of the carriers and the employees to agree upon the establishment of adjustment boards has substantially detracted from the effectiveness of the law. The Railroad Labor Board is in sympathy with this view, because it has keenly felt the need of the help that it would have derived from such adjustment boards. Of course, this statement carries no implication as to the merits of any par-

Magic Yellowstone!

Its mammoth terraces, mighty geysers, boiling pools, mud volcanoes and other hot water manifestations; its gorgeous Canyon and Great Fall, its whole mountain grandeur; its recreational facilities—stand unchallenged among the world's summer vacation lands.

You can't make Yellowstone relative because there is no standard of comparison. No imagination can picture it.

You'll just have to see it!

Via two widely divergent routes the BURLINGTON operates through trains and through cars direct to the Park gateways. The most-for-the-money way is to enter at Gardiner and leave over the famous Cody Road—the most scenic 90 miles in America. Then you can travel via Scenic Colorado—no extra transportation cost if your ticket reads "Burlington."

Let me explain how well Burlington Service may be utilized on any western tour, and provide you with interesting booklets about vacations in Yellowstone and elsewhere in the west.

he length of a course may be from one month to three years, ven longer.

length of the course often governs the number of meetings eek or per month. In an intensive course of, say five weeks, dvisable to hold session several days a week, or even daily. is on the theory that the foreman-student should be in a posi-to apply his newly-gained knowledge to his everyday job as soon as possible after he has learned his lesson. This gement is especially necessary where the firm is anxious to cate a chronic labor turnover and a sudden slackening of uction due to mismanagement. Quick action is in order and oreman must learn rapidly. The writer knows of one plant e an intensive course of foreman-training required daily dance by the entire supervisory force, from 10 to 11:30 in norning.

here a long course is planned, one that covers the entire of executive training for the foreman, it should be sufficiently ble to be offered in parts, each part constituting a definite se of study with definite application to special needs of a p of foremen. The Federal Board for Vocational Educa-suggests a complete course covering 82 sessions, or a total of hours. However, the course is divided into three sections, ing with supervision, cost elements and management respec-y. These divisions in turn are subdivided into a total of en units. Each unit, or group of units, can be offered as a rate course designed to meet the pressing educational needs group of foremen. Furthermore, the entire course can be red in units simultaneously to several groups of foremen.

lany firms find it advantageous to introduce foreman-training a brief course. The course is of a more or less technical re and appeals strongly to the men who are not accustomed lass group or individual study. Having convinced themselves such training is benefiting them, the men are prepared for more lengthy course which takes up the broader and more eral phases of executive management. Thus, a certain firm developed brief courses of three or four months duration. employment manager who organized the course watches the gress of the work as it appeals to each man, and he hopes to this information that in time he may develop a course of dy to last five years.

n the small plant the safest thing to do is to develop a short rse of, say, three months, shaping the subject matter so as to peal to every man in the group. Later other courses will be ded, and the group then subdivided into smaller groups and rses offered to meet the individual needs and interests of the n. In the larger plants the opposite plan is often used; special-d courses are offered to groups, and a general course is then ered to all men.

Where the plant employs only a few foremen it is a good idea combine with several other local firms and arrange a group foremen employed in these plants. Care must be taken, how-er, to interest only those foremen who have common educational erests.

A plan followed by several hundred large and small firms pro-des for an intensive course of training lasting twelve weeks, e groups meeting formally every two weeks to discuss the les-ns. The groups generally meet right after work. The study riod is preceded by a supper served at the expense of the firm, d the study session generally ends around 7 or 7:30 P.M. he foremen can go home with the feeling that they have not been prived of a full evening.

The length of the course also depends on the technical experi-ce of the foremen. In one plant a course lasting six months offered. Another course lasting a year is offered to foremen ho have had considerable technical experience. In another plant e length of the course is optional with the foremen. The official me of the course is two years, but it is divided into terms of four onths each. A foreman can study as many terms as he chooses, ut he must undertake to finish at least one term before he can ake another term of study. While some courses provide for wo sessions a week, the general rule is for a session of two hours eekly, and where the course is protracted the session may be eld fortnightly or once a month.

CONSTRUCTION
BOND

"The Paper of Known Substantial VALUE"

FIRST impressions do count and they mean just as much in the letters you write as in the interviews which your salesmen secure to sell your goods.

The first impression which any letter makes depends on the stationery on which it is written. For as you have frequently heard—"Your stationery is your business photograph."

You can secure, if you are willing to pay the price, impressive stationery which *advertises* its *expensiveness* and, theretofore, inevitably suggests extravagant methods, high prices and fat profits—or you can use CONSTRUCTION BOND, the Paper that makes Impressive Stationery at a USABLE PRICE.

Construction Bond is known to be less costly for its quality than other fine bond papers because it is marketed not through local jobbers a *fraction of a ream* or more at a time, to any printer or lithographer who will buy them, but *direct* to *responsible* printers and lithographers throughout the United States, in quantities of *500 lbs. or more* at a time.

Thus every sheet of Construction Bond goes into your business stationery *minus* the usual jobber's profit, *minus* his expenses of handling small lots, minus his losses on small and questionable accounts—only the expenses essential to perfect distribution and service are left.

The next time you order stationery be sure to specify Construction Bond, "The Paper that makes Impressive Stationery at a Usable Price."

VITROLITE

There is no question that the best time for a group to m is the first thing in the morning, as the men are fresh and think capacity is then at its height. But everyone at all familiar w a foreman's duties will tell you that this arrangement is hard practical, as the foreman's time is pretty well taken up in t planning of the day's work. Taking the foreman away from th task might cut into the department's production for the day.

Holding the conference after the workday also has its disa vantages, chief of which is that the men are tired and hard inclined to do solid thinking. As already pointed out, this i gotten around by treating them to a pleasant supper party rig after the day's work, and then after a brief chatting period and smoke they are refreshed for study.

In one plant, where an intensive course of foreman-trainin was in progress, the management arranged for one session a wee in the morning and a second session on an afternoon, right befor closing time, the session lasting until about an hour after the factory closed.

The question of a proper meeting place is not easily settled. The first essential is that it be convenient for the foremen to get to the place during or after work without loss of time in transportation. The most ideal choice is a room in the plant proper, but certain precautions must be taken into consideration. First, the room should be in some quiet part of the plant, away from the noise of machinery and intrusion of workmen and outsiders. The foreman wilts under the collar at the thought of workmen watching him "take lessons." The meeting place should be so removed from the hustle and bustle of the works as to enable the foreman-student to lose all self-consciousness. In the large plant the group conference is usually held in the assembly. In others it may be held in plant cafeteria, especially when it is preceded by a supper at company's expense. An ideal meeting place is the plant library. It is removed from the noise of machinery, the surroundings are pleasant, and there are always a number of interesting books and periodicals lying about which the foremen can read after the meeting if they like. A small group can meet in the office of the works manager or the superintendent, or if that is not convenient, in the office of some other department head.

Outside of the plant, a most convenient meeting place is at some nearby hotel, especially if a larger number of men are taking the course. For a small group a convenient place is at the home of the superintendent or some other factory executive. This is not always convenient and pleasing to the men, as it is never certain that the home will be available regularly and the foremen feel that they have to dress properly. A group meeting in the plant enables the foremen to meet right after work and does away with the necessity of changing clothes. In some plants arrangements are made with the local school authorities to hold group meetings in a nearby school building. This arrangement also has its disadvantages, as the foremen are not comfortable in the regulation school room atmosphere.

Continued from Page 16

ticular disagreement that may have arisen as to the setting up of an adjustment board.

It is in evidence in these hearings that the main point of disagreement between the carriers and the employees in connection with this matter is the territorial scope of the proposed boards. The law provides that adjustment boards may include one carrier and one organization or any number of carriers and organizations.

The Railroad Labor Board held, soon after its organization, that it had no jurisdiction over a dispute as to whether a proposed adjustment board should be established.

My suggestion would be that the Railroad Labor Board be given express jurisdiction of a dispute of this nature, so that it might fully consider and pass upon the respective contentions of the parties as to the establishment of any such adjustment board. but that the law as to such boards otherwise remain as it is.

The wisdom, justice, and practicability of the establishment of any proposed adjustment board or boards could be decided upon after a thorough investigation of the matter.

While the Transportation Act, 1920, does not make a decision of the Railroad Labor Board legally enforceable, the steps leading up to such decision are mandatory.

MID-WEST URGED TO PUSH DEVELOPMENT OF AVIATION

THREE hundred persons, representing all phases of Mid-West aeronautical activity, were present in the red room of the Hotel LaSalle, Chicago, this week to hear discussions of the subject and to see the four splendid reels of warlike aviation films shown by Rear-Admiral William F. Fullam, U. S. N., retired.

Chicago's spirit seems, aeronautically speaking, about to blossom out into a metropolitan consciousness. Thirteen years ago it took Robert Fowler seventy-two flying hours, spread over thirty-five days, to span the continent, west to east, the first time in an airplane, he said last night.

"Now the airplane has passed the 'plaything' stage," he continued. "My plane held but twenty gallons of gasoline, while now the continent may be spanned in one nonstop flight within thirty-seven hours, as the T-2 did last year. Lieut. Maughan will probably see both coasts this summer in the same day, going better than three miles a minute."

Whether or not the National Aeronautic association is destined to bring aeronautic coherence to the Mid-West, it was quite certain from the applause for aviation in general that there is a great desire for all to boost together for the territory and help Chicago take its right place in the sky-traveling sphere.

"There are two kinds of birds," said David L. Behncke, president of the Commercial Flyers association, in his address. "The parrot talks much and flies little, while the eagle seldom talks and is a good flyer. So it is, there are many of us Middle Westerners who want to be like the eagle, and are even willing to teach the parrots how to fly if that will boost the game more effectively here."

C. A. Livingston of the Illinois Manufacturers' Association said I. F. Dains of Monmouth, Ill., chairman, and the entire I. M. A. aviation committee would co-operate to aid aviation for the state of Illinois in every way.

William P. MacCracken, one of the founders and at present governor at large of the N. A. A., said that the N. A. A. was determined to get for the Mid-West the aeronautic progress it rightfully deserved.

A plea for a square-mile landing field, to be built in Lake Michigan a half mile off shore, was made by William Hale Thompson, former mayor of Chicago.

"The key to becoming the aviation commercial center of North America is a good centrally located landing field," he said. "If we can get congress to erect a sea wall containing a mile square in that thirty-foot or less water off our shore, we can get plenty of excavation dirt and other debris to fill it and have it ready for use within two years. Tunnels can connect it with the postoffice, so that the mails can be hurried rapidly from plane to office, and vice versa. It is about time we stopped talking and got some action."

Admiral Fullam said that most aircraft can easily be equipped to land readily on either water or land.

It was then moved by Mr. Thompson that Admiral Fullam head a committee to go to Washington at once to begin work to get the federal appropriation through for the proposed mile-square lakefront aerial terminal. This was carried unanimously and Admiral Fullam accepted the appointment.

Orders Standard Oil Stock Sold

President Coolidge by executive order has authorized the alien property custodian to sell 97,295 shares of capital stock of the Standard Oil Company of New Jersey, taken under the trading with the enemy act, and invest the proceeds in United States government securities. The order specifies the stock shall not be sold at less than its par value, $25. Authority for the sale was given, the executive order said, because investment in government securities would "produce a yield greatly in excess of that derived from the dividends upon said stock. The stock was the property of Carl Schutte, Louis E. Braesecke, Gustav Schutte, Wilhelm A. Riedermann, Erwin C. Riedemann and Meta Schutte.

New Birmingham Route

The Mississippi Central Railroad and the Louisiana & Arkansas Railway have made an interline arrangement with other roads whereby they will operate freight trains into Birmingham, Ala., it was announced this week by L. E. Faulkner, general manager of the Mississippi Central.

SOUTHERN PACIFIC

An Analysis of Its Position

UTHERN Pacific Company's report for the year ending December 31, 1923, rs consolidated net income of $44,- 482 after taxes and charges, equivalent $12.94 per share of common stock. e was carried to surplus after divi- ls, sinking fund and other appropria- s an amount of $22,351,857. Last 's profits compare with $32,600,000 re- ed in 1922, equal to $9.47 per share, le the addition to surplus for that year less than half the amount carried for- d in 1923. Total operating revenue for year was in excess of $287,000,000, the est in the company's history.

apitalization of the Southern Pacific npany consists of capital stock (par 0) outstanding in the amount of $344,- ,000 preceded by a funded debt of some 3,000,000. Capital stock of subsidiary ipanies is outstanding in the amount of 6,000,000. The company's obligations , for the most part, in distant maturities rying a low coupon rate.

ncorporated in 1884 the company is one the oldest of the holding corporations. e Southern Pacific System extends from w Orleans to the Pacific Coast, serving h centers as New Orleans, Dallas, Fort rth, Shreveport, Galveston, Houston, El so, Los Angeles, San Francisco, Portland d Salt Lake City. The company also ntrols the Southern Pacific Railroad Com- ny of Mexico representing an investment $43,000,000. In the long list of other terprises controlled by or affiliated with e Southern Pacific Company are the uthern Pacific Land Co., Pacific Fruit press, Central Pacific Railway, Pacific ectric Railway and steamship lines. In 20 the California oil properties owned by e Southern Pacific Land Co. were pur- ased by the Pacific Oil Company for 3,750,000, Southern Pacific Company ockholders being given the right to pur- ase the shares at $15 to the full extent f their holdings. Railway lines embraced y the Southern Pacific Company total me 12,000 miles.

The company's revenue tonnage has own expansion over the past ten years nd the freight business handled presents diversification made up to the extent of 0 per cent in products of agriculture; 32 er cent in products of mines, 22 per cent roducts of forests and 25 per cent mis- ellaneous manufactures.

The capital structure has benefited by a eduction in funded debt, while capital tock has proportionately increased. In- erest charges which in 1915 amounted to lmost $30,000,000 were less than $23,- 00,000 in 1923.

The percentage of expenses to gross business has been maintained at a relatively low level, the operating ratio averaging around 65 from 1914 to 1917; about 75 in 1918 and 1919, rising in 1920 to above 85, with a subsequent reduction to slightly more than 70.

The current dividend rate of 6 per cent has been in effect for sixteen years. In each year of the last ten it has been more than earned with the exception of 1920, while the average annual earning power for that period has been almost twice current dividend requirements.

The company's operating expenses charged to maintenance of way and equipment have been liberal, averaging about $90,000,000 in each of the last four years. Rolling stock and other equipment provided for during 1923 amounted to approximately $38,000,000. The condition of the company's cars and locomotives is accordingly excellently maintained, only about 6 per cent of its more than 56,000 cars awaiting repairs as of April 1 and 18 per cent of its more than 2,000 locomotives.

The company's current operations show a slight falling off in comparison with the first quarter of 1923, gross exceeding the same period last year by about $1,200,000 while net operating income declined approximately $1,750,000.

The range in the stock has been as follows since 1914:

Year	High	Low
1914	99½	81
1915	104⅛	81¼
1916	104⅛	94¼
1917	98½	75¾
1918	110	80½
1919	115	91⅞
1920	118⅛	88⅛
1921	101	67½*
1922	96¼	78⅛
1923	95¼	84¼
1924	93¼	85½

*Ex rights.

At current quotations of around 90 the stock yields approximately 7 per cent. Shareholders number some 60,000.

The combined balance sheet of the Southern Pacific and proprietary companies as of December 31, 1923, shows total assets of almost $2,000,000,000; road and equipment are represented by an amount in excess of $1,000,000,000; investments in affiliated companies $612,000,000; cash and other investments $60,000,000; inventories $35,000,000; accounts receivable $15,000,000; current liabilities total some $40,000,000 with profit and loss surplus of $313,000,000.

In his remarks to stockholders President Julius Kruttschnitt stated that "Western railroads have suffered the diversion of a large volume of transcontinental freight to the steamship lines operating through the Panama Canal. To retain or recover their share of this traffic requires rates by railroad approximating those obtainable by steamship. The loss of a very substantial amount of revenue will continue to be sustained unless the prevailing rate discriminations can be modified."

SOME MINOR MOTOR MARKETS

EXPORTS from the United States to Chile in 1923 were 795 passenger cars and 567 trucks. An American manufacturer is contemplating a new assembly plant in Santiago, and material for the first 200 cars is now in the country. The production schedule for the remainder of this year calls for 200 motor vehicles per month, and approximately twice as many next year. The local manager of the company believes that a large field exists in Chile for the motor truck, and predicts an increasing demand for passenger cars.

Exports from the United States to Brazil in 1923 were 2,136 passenger cars and 27 trucks. Thirty-five automobiles were imported at Rio de Janiero in March, of which thirty-three came from the United States and one each from France and Italy. Many more entered through Santos to escape the 2 per cent gold port tax charge at Rio de Janeiro. Most of the American distributors reduced prices early in the month, making the present selling price in the thousand dollar class about 13,500 milreis. Terms of sale have not changed, most cars selling for one-half cash and the remainder in twelve monthly payments.

Exports from the United States to Spain in 1923 were 6,330 passenger cars and 1,117 trucks. All cars shipped to the Madrid District should be equipped with left-hand drive, due to the change in the city traffic laws. Effective April 15, traffic in the streets was changed from left to right. Madrid previously was the only city in Spain where traffic bore to the left instead of the right, and due to this condition American manufacturers in some instances furnished their Madrid representatives with cars installed with right-hand drives.

Exports from the United States to Turkey in Asia and Turkey in Europe in 1923 were 40 passenger cars and no trucks. About 750 cars are estimated to be in operation in Constantinople at present, 60 per cent being of American origin, and the remainder from France, Germany, Italy, Spain, and Austria. Of this number about 50 are trucks. The closed body type of car is growing in popularity, and there is a very limited market for the machines costing much over $1,500. There is practically no market for trucks, many good machines now laying idle. Business men believe that if sound economic conditions return, a considerable market for automobiles will be open in Turkey.

Exports from the United States to Hungary in 1923 were 14 passenger cars and no trucks. During 1923 a number of agencies for automobiles were established and much business could be done were it not for the restrictions which the Hungarian government has imposed. A commercial agreement recently entered into between Hungary and Italy gives Italy an extra quota of 10 complete automobiles per month under the import license system. The regular contingents are 50 complete automobiles per quarter. Efforts are being made to secure similar concessions for other countries.

Exports from the United States to Sweden in 1923 were 6,744 passenger cars and 1,765 trucks. Decision has been made by the Swedish government to submit a proposal to Parliament to raise the present tax on motorcycles without sidecar from 15 to 20 Kronen and on motorcycles with sidecar from 25 to 30 Kronen. Further it will be proposed that the now levied tax on automobiles with soft rubber tires of 8 Kronen for every hundred kilos or part thereof shall be supplemented by a basic tax of 32 Kronen and that in addition to the present tax of 50 Kronen for every hundred kilos or part thereof for automobiles with tires of other material than soft rubber there be levied a basic tax of 32 Kronen.

Exports from the United States to Portuguese East Africa in 1923 were 42 passenger cars and 29 trucks. Passenger car traffic in Portuguese East Africa has been stimulated by completion of a road from Lourenco Marques to Inhambane. Private individuals are buying cars and a bus service has been started between Xinavane and Inhambane, with two American busses in operation as far as Chai-Chai.

A LETTER TO THE EDITOR

Another Side to the Discussion of Trade-Mark Legislation

Editor MANUFACTURERS NEWS.
Sir:

I have your letter of May 13th and copy of the MANUFACTURERS NEWS. It strikes me that the caption, "Trade-Marks Menaced?" is rather severe on the American Bar Association bill which is Senate 2679, and which was very carefully prepared not to menace trade marks at all, but to furnish additional means for their protection. * * * * * In view of the limitations imposed upon the power of Congress by the Constitution entirely adequate Federal Trade Mark legislation is impossible, but we have gone as far as we think the law permits.

A group of dissenters in Washington have prepared a measure which is Senate 2920. This measure, it seems to me, would seriously menace trade mark protection because it permits the registration practically of anything by anybody.

* * * * *

May I call attention to one thing in the second column of the article under caption, Senate 2679? The word "ownership" is much emphasized, as if it were-intended to call attention to some radical difference between this proposal and existing law. This sentence is an exact duplication of the first two lines of Section 16 of the Act of February 20, 1905, which provides: "That the registration of a trade mark under the provisions of this act shall be prima facie evidence of ownership. It was carried into the act from Section 7 of the Act of March 30, 1881, which provides: "That registration of a trade mark shall be prima facie evidence of ownership." Indeed, this is the virtue of registration of a trade mark—that registration and the attendant publicity of the claim of ownership which registration makes, and the notice of this claim which registration gives, raises a presumption of ownership by the registrant and thus simplifies the proof of ownership which the registrant is required to make when his trade mark is infringed.

I trust that you will consider this letter as entirely good-natured criticism, but I cannot help but feel that the Bar Association's measure, which has been given such painstaking care by people who have devoted much time to the study of the subject, ought at least be given a little more favorable comment than it has received in the MANUFACTURERS NEWS, and should not be placed on an equality with Senate 2920, a measure which, it seems to me, is ill-advised and hastily and carelessly drafted.

With regards, I am
Yours sincerely.
(Signed) Edward S. Rogers.

NOTE: Attorney Rogers is chairman of the committee of the American Bar Association having charge of proposed changes in trade-mark laws.—EDITOR.

nada, our northern neighbor, is in the market for drills, hammers, etc., iron for boys' tops, women's slippers, sporting goods, gifts, jewelry and watches.

nfidential information concerning any of the week's opportunities may be obtained y reader of MANUFACTURERS NEWS *who will write stating the serial number tem desired.*

ais week's list follows:

ALIA—
: Electrical accessories. Dry goods.

IA—
: Boots and shoes, all kinds. Tennis shoes.
: Calfskins, raw. Ox hides, first quality.
: Lasts for various shoe styles.
: Sizing, warping, and winding machines. Looms, automatic power.
: Tanning machinery and tools.

UM—
: Automobile accessories for low-priced cars.
3: Packing house products such as lard, bacon, hams, and frozen beef.

L—
3: Machinery for extraction of oil from fish. Machinery for handling fish waste.

DA—
4: Drills, hammers, etc. Motors, small.
6: Iron points for boys' tops.
0: Slippers, women's.
7: Sporting goods. Gifts. Jewelry. Watches.

A—
5: Automobiles, motor busses, spare parts. Gasoline, 2,000 cases per month. Tires,
30: Phonographs. Phonograph records. automobile.

MBIA—
57: Pumps. Windmills. Well drilling outfits.

—
49: Shoes, for men, women, and children.

MARK—
95: Canned salmon, pink.

PT—
37: Steel shuttering for reinforced concrete building work.

LAND—
03: Elderberries. dried or canned.
77: Underwear, fleeced, for men and boys.

NCE—
24: Automobiles. Trucks, motor. Bicycles. Sewing machines.
286: Canned salmon. Fruits, dried, California. Rice.
283: Sugar.

MANY—
320: Automobiles.
319: Automobiles, 6 to 10 horsepower.
322: Automobiles. Automobile accessories.
327: Automobiles and accessories, high grade.
317: Automobiles. Motorcycles.
318: Automobiles and trucks, 4 and 6 cylinder.
299: Apples, pineapples, bananas, good quality.
345: Belting, best and medium quality.
278: Cotton. Cotton waste.
310: Dolphin hides, raw.
297: Flour, medium quality. Rice, cheapest. Sugar.
293: Feedstuffs and foodstuffs, all kinds.
383: Lubricating oil.
344: Shoes, cheap grades for women.
308. Upper and sole leather in good quality.

EECE—
0370: Cameras. Optical supplies. Photograph supplies.

HUNGARY—
10321: Automobiles, 4 and 6 cylinder. Automobile accessories.
10328: Automobiles, 4 cylinder, 20 to 24 horsepower. Automobiles, 6 cylinder, 50 to 60 horsepower. Bicycles. Motorcycles. Tires, automobiles.

INDIA—
10343: Hardware. Hosiery. Sundry lines, as fancy goods.
10372: Jewelry. Name embossing machines. Pumps, well.
10371: Motion picture machines and supplies.

ITALY—
10292: Codfish, dry.
10323: Automobile parts and accessories, especially for low-priced cars.

JAVA—
10334: Automobile accessories. Steel. Hardware and tools.
10344: Steel products.
10360: Machinery. Scientific instruments.

LITHUANIA—
10364: Ovens for manufacture of charcoal, turpentine, and pitch. Stumppullers.

NORWAY—
10376: Glass covers for coffee percolators. Handles and knobs for household utensils.
10377: Copper-coated aluminum sheets, 50 per cent copper and 50 per cent rolled aluminum.

NETHERLANDS—
10311: Automobile accessories.
10282: Apples, red, in boxes.
10352: Belts, rubber, waist, best quality.
10284: Corn products. Flour. Grain. Linseed cakes. Rice. Rolled oats. Semolina.
10352: Hosiery, men's, cheap.
10311: Radio apparatus.

NEW ZEALAND—
10341: Fertilizer, basic slag.
10399: Hardware specialties.
10340: Hardware, builders', best quality.
10356: Machinery for tracing embroidery designs on textiles.

POLAND—
10326: Automobile accessories. automotive novelties.
10366: Fungicides. Insecticides. Orchard sprayers, medium and large, motor driven.

SOUTH AFRICA—
10368: Photographic supplies, professional.

SPAIN—
10325: Truck chassis, one-ton.

SWEDEN—
10294: Seeds, grass and field.

SWITZERLAND—
10338: Steel pipes, seamless, of various sizes.

TURKEY—
10384: Petroleum products.

YUGOSLAVIA—
10359: Emery paper. Varnish stains and material for. Wax. Sawmill blades.

Are You "Behind the Times"?

Not many years ago your grandfather reaped his crops—picked his cotton — dug canals and loaded his ships by hand. He also shoveled coal on his fire and hauled out ashes.

Today — you have advanced. You have machinery to do the work your grandfather did by hand. But—do you still shovel coal and haul out ashes? In Chicago today—Manufacturers are keeping abreast of the tide of industrial advancement and *improving* their products, simply because they know that—

If it's done with heat—

Manufacturing Locations for Sale

Along the line of the Chicago, West Pullman and Southern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad, the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound, with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Chicago, West Pullman and Southern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

For complete information, including rates for transportation and prices of land, apply to

T. J. MALONEY, General Freight Agent

ideas. But you will doubtless recall that five years ag could count on your ten fingers the employers who had ac the new industrial doctrine and had put it into effect in their lishments. Now that doctrine has become an everyday f American industry. Now it is the industrial law of hundre big and little industries, regulating the relations of hundre thousands of workers with their employers.

I do not hold any brief for the International Harvester C pany's plan of employe representation, but I am an earnest even aggressive advocate of the principle which that plan em and expresses. It does not greatly matter by what system of r or regulations this idea of employe representation is put i effect. One system will fit one factory and yet might not p workable in another; one system may be cumbersome and produce identical results with another and simpler system. I principle, the idea, is the all-important thing—the long ign and long denied idea that, as the shining sentence of my text t puts it, "The human element in industry is the factor of gre importance."

Now, since my subject is abstract, perhaps you would pre that I should discuss it with you in abstract times, but I can do that. If I am going to be in any way helpful to you, it w not be so much through discussing any theories of the industri relation that I have developed for myself or have borrowed fr the abundance of superior wisdom in this field, as through dr ing on personal experience with a system by which some of the theories have been most happily proved and most fortunately m into living and durable facts. On this basis, I believe you w pardon me for what seems necessary reference to the Harve plan of employe representation and to my own experience wi it and under it.

In my time I have had some wonderfully good fortune. b never anything better than the opportunity to be both an eye witness and a participant in the building, the launching and th operation of the Harvester Plan.

It has been a rare opportunity for a variety of reasons. Th principal owners of the company are men with a very defini sense of stewardship toward their business and their resour and their employes. They are conservative men, yet, upon oc sion, boldly aggressive. The company's management faithfull reflects this idea of stewardship and this policy of progressi conservatism.

Again, the manufacturing and raw materials operations of th Harvester Company cover a wider range of craftsmanship an occupations than any single company with whose affairs I a acquainted—mining, lumbering, railroading, iron and steel production, and practically the entire list of trades employed in fabricating goods from metal and wood. Also its geographical rang is wide, with plants all the way from Eastern Canada to Ne Orleans, and from the Mississippi Valley to New York State Here, then, was a sufficiently varied field for a thorough working test of the principle of employe representation.

This six-year experience has offered ample opportunity to g down to bedrock in the employing mind as well as the mind of th employe on this subject of industrial relations. First came th job of selling the idea and the plan to the employing end of th business. Here, again, it was fortunate for this experiment th the spirit and purposes of this company are remarkably democra ic. We had an administrative group to deal with which w entirely conscious of the privilege of each member to speak h mind freely on any problem in which he was concerned, and ea of these individuals had the courage to do exactly that thin whether he thought his views were in line or out of line with th management's views.

To Be Continued

Continued from Page 9

cent in this year's taxes so as to make it as objectionable, if n more so, than the present bill, and to keep Congress here to fi it out on that line if it takes all summer. If there was any r hope of improving the situation by a long-drawn-out fight of th kind, the President would be amply justified in precipitating At the present writing the outlook for such improvement d not exist.

overriding the bonus veto Congress awakened to a reali-
of real trouble ahead if some order was not brought out of
islative chaos existing in both houses. Before the passage
bonus bill there was every indication that the McNary-
agricultural relief measure would pass the house and
ly the senate, carrying a $200,000,000 appropriation. As
e of its fear and desire for conciliation, the indications
e that the McNary-Haugen bill will actually be defeated in
use unless the democrats conclude to play politics with it.
eaten by fifty votes today. Likewise, the Barkley bill,
ing the railroad labor board, is on the rocks and, if passed
is certain to be amended so its sponsors will not be particu-
nthusiastic about it.
e administration Senators, like David Reed of Pennsylvania,
erved notice on the congressmen dependent upon them for
age, that if they do not support the administration here-
hey can go elsewhere for help.
ator Henry Cabot Lodge has reached the end of his rope
nti-administration leader. He received a telegram from the
an of the republican state committee of Massachusetts
ng him to vote to sustain the President on the bonus veto or
t of the state hereafter. A mass-meeting of republicans has
alled in Massachusetts to invite him to stay away from the
and convention to which he has been elected as a delegate-
e. His plan for a world court, new in every particular,
en shelved in the Senate and is too dead to rise again. Lodge
e funny notion that his narrow escape from defeat two years
as due to his work in the Washington arms conference at
he was one of the four American delegates. If this is a
e of his mental capacity the rest is easily understandable.

DEMOCRATIC OUTLOOK

lliam Gibbs McAdoo is cocksure he will be nominated at
York and elected in November. This week he summoned
or Ralston of Indiana, looked upon as a dangerous "dark
" in that convention, and told him that while he, McAdoo,
ted Ralston to have the Indiana delegation to the last ditch
w York, what he really wanted to know was how he, McAdoo,
l run in Indiana after he was nominated. Poor old, "Honest
walked out of the conference so flabbergasted by McAdoo's
de he hardly knew his own name. Opinion around Washing-
s that McAdoo's nomination or defeat is squarely in the
of one, George Brennan, democratic boss of Illinois. Sooner
er this pair must talk "political turkey."

nan-hour has increased over 30 per cent since 1919. But the
still remains that we have been having a hard task to get
to where we were before the war, and that in the future there
be no such increase in output per man as occurred before
, when the most revolutionary changes were taking place,
steel was coming into use, when transportation was develop-
and when electricity was becoming an industrial force.
ere is still a possibility that there may be a more rapid
ase in native population in the future, but it hardly seems
y that the net result of all these factors is going to be a
lete offsetting of the smaller number of immigrants. This
pecially true for those industries that cannot be subjected to
ine production, and where cheap manual labor is necessary.
was explained in the early part of this paper that the United
s has always been on a higher level of wages and living
dards than other countries. It is thinkable that if immigration
unrestricted, the time would come when our natural re-
ces would be exploited to the point where we would be brought
n to the level of other countries. But it is our policy to try to
tain this higher level, whether the rest of the world likes it
ot, and restriction of immigration is bound to be an important
r in keeping us there.
must not be overlooked that immigration restriction, together
the protective tariff, results in a partial economic isolation.
policy makes for higher costs of production and higher prices
commodities. Higher prices naturally tend to restrict our
rt trade, and it is therefore safe to say that our whole inter-

national trade will be less than it would be if we were to free trade and unrestricted immigration. Immigration restr will undoubtedly keep us from developing our natural re as rapidly as we have been developing them in the past, but o other hand we may be forced to develop our resources with m intelligence and with less waste. Immigration restriction lessen the unemployment evil, but will not do away with per of industrial depression and unemployment.

In short, our policy of restricting importation of both go and labor will undoubtedly have the effect of putting us o artificial plane of costs, prices, and well-being above those ex ing in other countries. This will result in restriction of our for trade and in a possible retarding of the development of our resources, but the United States, with its vast extent of territ and its great variety of climates and resources, is more or les world unto itself, and the chances are that we can successfull maintain ourselves on this high artificial level for an indefin period to come.

Finally, it should be borne in mind that this argument de primarily with the economic and business phases of the proble and that no attempt has been made to evaluate the benefits to b derived through quicker assimilation of foreigners, lessening our education problem, and a quickened American spirit. The factors would constitute an important argument in favor of re striction.

Our present policy aims to put us on a quality basis, rather than on a quantity basis. After all, perhaps by sacrificing some possible economic advantages, we shall be better off in the long run—a nation of greater average intelligence, and better fitte to accomplish and enjoy the finer things in life.

Continued from Page 20

The law should be so amended as to prevent the violation or evasion of the provisions which command conferences and negotiations to adjust a dispute, and the submission of it to the Board. Neither the carrier nor the organization of employees should be permitted to take arbitrary action until these requirements have been complied with, for in them lies the principal efficacy of the law. They afford four strong preventives of strikes: (1) Conference between the parties; (2) an opportunity to make full public presentation of controversies; (3) the decision of a tri-party board that may prove acceptable; and (4) "cooling time," something that has saved all of us from many mistakes in life.

No wiser and more just provisions were ever written into law They were meant to be mandatory and they should be backed up by appropriate penalties. This is of vital importance to the employees particularly, and it is even more important to the public.

In connection with the foregoing recommendation, there necessarily arises the question of representation of employees in con ferences, negotiations, and agreements.

The law having commanded the carrier to confer with the rep resentatives of the employees, a carrier should not be permitte to evade the law by conferring with somebody else under the pr tense that it is conferring with the employees' representatives. this is done—and it has been done—the very vitals of the law a cut out and cast away. A lawful conference has not been he until it is held with the chosen representatives of the employe A carrier should not be permitted to set up or collude in the setti up of a bogus minority organization which does not represent t majority of its employees. Such a performance is a violation the letter and spirit of the Transportation Act; it is contrary the genius of our free institutions; and it is inimical to peace the railway industry. It is, therefore, in contravention of sou public policy.

This right of the employees should be protected by explicit p visions with the sanction of appropriate penalties.

These sample amendments to the present law would make vastly more satisfactory to the employees and more servicea to the public, without any encroachment upon the rights of carriers. Such amendments would not involve the overturn of the present system of adjusting controversies and the ha adoption of an obviously weak substitute.

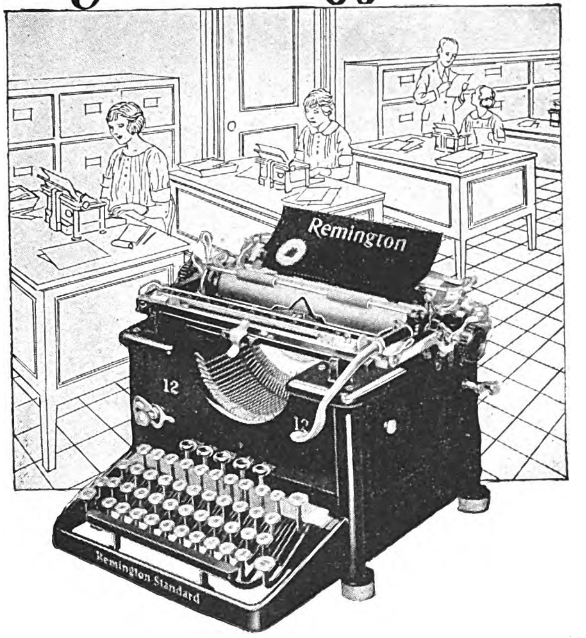
For general office use



Remington Standard 12

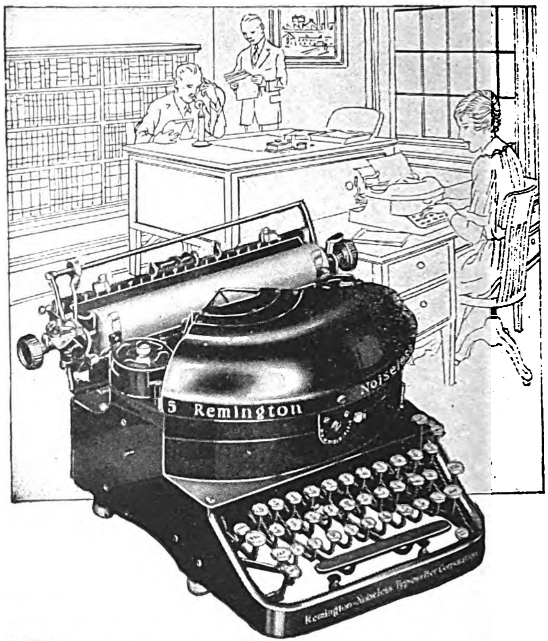
The New Quiet 12 is the crowning triumph of that great Remington factory at Ilion where the first practical typewriter saw the light of day fifty years ago.

In all of these fifty years, no other new model of a writing machine has ever won such instant popularity. In thousands of offices battery after battery of New Model 12's has followed the trial machine—so decisive are its many superiorities.

Its "natural touch" which makes operation surpassingly easy, its operating simplicity, and the consistent beauty of its work are a revelation to both owner and operator.

With all of its advantages, the New Model 12 costs no more than the ordinary typewriter, a fact which makes it the *incomparable* machine for general office work.

Where silence is desired



Remington Noiseless

The Remington-Noiseless (formerly The Noiseless Typewriter), the latest addition to the great Remington line, is in every respect worthy of its new and greater name.

It is rightly called "Your Silent Partner," for it has achieved that precious silence so essential in many business offices.

In New York City alone—in prominent banking houses and corporation offices—over 20,000 of these machines are now in service, and their number is increasing daily.

The Remington-Noiseless can *now* be obtained anywhere in the United States and Canada. It is distributed by Remington branches and dealers—equipped to give expert and universal service. Present Noiseless owners are invited to use these new facilities.

The Greatest Problem

By DR. FRANK CRANE

THERE have been all sorts of greatest problems before the world. But there is one which is greatest of the greatest.

It involves, includes and implies all of the problems. Once settled, it will leave nothing much more to be settled.

For instance, the labor problem is not simply one of getting more wages; of getting the labor organizations recognized; of securing proper legislation; of remedying certain wrongs and establishing certain rights. The whole problem is for all the laborers, including those who work with their brains and their money as well as those who work with their hands, to get acquainted, to realize that the interest of one is the interest of all, and to work together.

When you simmer it down to its final quintessence, there is but one task before the world. It is to learn how to love and how to quit hating.

One of the wisest writers in England is Alexander M. Thompson, well known as "Dangle" of THE CLARION. He is a Socialist, but not one who believes in the almightiness of any program, Socialist or otherwise. He sees the humanities. He is one of the many in England and America who are battling with great ability to save industry from the stupid men of capital and the wild men of labor. Recently Mr. Thompson said:

"Above all, we must restore the human relationship between the captains and the rank and file of industry. Too long has it been the function of the one side to exploit and of the other to resent and resist.

"This bad old way leads to friction, bitter strikes, mutual hostility, and eventual ruin.

"The common people are not all slackers and strikers, who care for nothing but beer and wages.

"The employers are not all idle parasites, conscienceless profiteers and greedy bloodsuckers.

"Our business—on both sides—is TO RESTORE AND DEVELOP THE HUMANITIES."

YOUR MEN'S EYES

By LEWIS H. CARRIS

Managing Director, Natl. Committee for the Prevention of Blindness

YE accidents surpass all other industrials hazards in seriousness, with the single exception of fatal accidents whether asured from the humanitarian, the cost sheet, or the production ndpoint.

Approximately two hundred thousand eye accidents occur in ustry annually, and it is estimated that several thousand eyes permanently blinded as a result. There is hardly an industrial upation in America which does not add annually to the steadily reasing total of the industrial blind and near-blind.

Of a total of one hundred thousand totally blind persons in the ited States, fifteen thousand, or nearly one-seventh, became through industrial accidents. A still greater number suffer m loss of one eye, or impaired vision, caused by accidents ile at work.

The science of human rehabilitation has developed artificial nds, arms, and legs that can do almost anything the human mber can do, but no one has yet produced an artificial eye t can see. This fact alone makes the eye hazard the most ious of all non-fatal accident hazards.

Even from the purely economic point of view eye accidents t more in compensation, in medical treatment, and in loss of oductive efficiency than any other form of non-fatal accident. Pennsylvania, for instance, 40 per cent of all the compensation arded for permanent injuries during the last eight years was arded for eye injuries. The total amount awarded was more an $15,000,000 of which more than $6,000,000 was paid for loss eyes. Only two out of all industries listed in the compensation cords of Pennsylvania did not pay compensation for eye injuries.

Besides the direct cost of compensation and medical treatment r eye injuries, two other principal factors contribute to the onetary cost of industrial eye hazards. They are the indirect st resulting from spoilage of raw materials and finished prod- ts, the latter often including extensive labor costs, and the tural slowing up of the individual's work and of the whole dustrial machine resulting from defective vision, from poor ghting, and from accidents caused wholly or partially by poor sion. These costs aggregate many millions of dollars a year.

The chief eye hazards in industry are, briefly, first, the accident zards, such as flying chips of metal, minerals and wood; splashing liquids such as molten metals, acids, and other injurious chemicals; and explosions of all varieties; second, there are the hazards of infections and eye diseases which arise from neglect of eye injuries, incompetent first aid treatment, contact with carriers of contagious disease, and exposure to excessive radiated heat; and finally there is eye strain resulting from improper or inadequate lighting, improper vocational placement, and from ignorance of or disregard for the existence of defective vision.

The solution of the eye hazard problem depends principally upon three forces: Legislation, education, and organized accident prevention activities in industry. There must first of all be laws requiring the reporting of accidents, specifying safeguards, and providing for the compensation of injured workers. Intelligent legislation, fair to both employer and employe, is a prerequisite for the prevention of eye accidents, as well as for other forms of industrial safety work.

But education of workmen, foremen, superintendents, plant managers, and of owners themselves is just as important, because of the fact that many accidents result from causes that cannot be guarded against by any mechanical means. All the legislation in the world cannot keep a workman from shoving his goggles up to his forehead when he is not being watched if that workman has not been convinced that he should wear goggles every minute of the time during which he is engaged in work that presents a serious eye hazard. Only education can do that.

Given ideal safety legislation and thorough-going safety education, there is still the need for definite and carefully organized accident prevention activities within the individual plant, mine, railroad, or other public utility. Mechanical guards must be designed, purchased or manufactured, and installed and maintained in working order. There must be frequent inspection of plant conditions and operating methods. Intelligent supervision is necessary. Illustrated posters, warning signs, and other forms of safety literature are needed.

Where such a program as this has been carried out, completely and effectively, eye accidents have been cut to almost nothing, while great profits have been realized from the resulting increases in production which have occurred.

NO WAR WITH JAPAN

But the Japanese Must Have an Outlet for Their Surplus Population

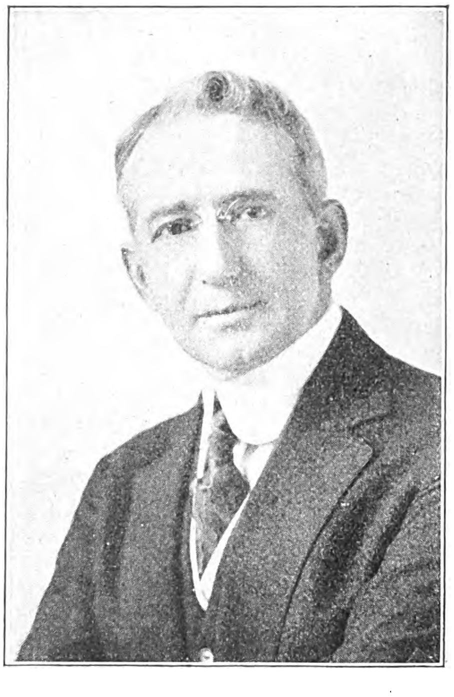
By AUGUSTUS D. CURTIS

A WAR between Japan and the United States is about as remote as an earthquake in Chicago. Judging from what I have seen, the Japanese are not looking for trouble. They have just had an earthquake which is keeping Tokio and other cities busy. The politicians and the newspapers are a good deal like they are in this country, stirring up things as part of their daily work and what these elements say must be accepted with a seasoning of salt. I saw no organized effort or any evidence that there would be a boycott of American goods. The truth is Japan needs American cotton. certain varieties of American machinery and cannot get these commodities elsewhere.

Everybody knows the Japanese are a proud people and a capable people. They also are a sensible people. They can see nothing to gain by a war with the United States at this time, no profit, no glory, nothing but hardship and loss of treasure.

I have been told over and over again by the educated Japanese with whom I have come in contact in the larger cities of the Empire that much as they deplore the passage of an immigration act which excludes the Japanese from the United States, they realize they could expect nothing else. Americans are not allowed to become citizens of Japan, to own property or to compete with Japanese. Any fair-minded Japanese will tell you that Japan has no right to expect anything more than is granted by their own country to Americans.

Japanese immigration either to the United States or some other country, is an economic more than a political problem. There must be some place for the Japanese to go. There are eighty million of them and they all cannot stay on the small Islands of Japan. So the surplus Japanese are moving westward. They are spreading to Korea and Manchuria. They are found in many thousands along the line of the Trans-Siberian Railroad. We have shut them out of the United States. Asia will get them. No one knows what Japanese enterprise and pugnacity will accomplish when grafted on the Chinese.



AUGUSTUS D. CURTIS, President of the Curtis Lighting, Incorporated, has just returned to Chicago after a five months' tour of the world. He made a special study of foreign trade conditions.

Unrest prevails in every country ruled by Europeans and Americans. It is found in Egypt, India, Java, Ceylon and the Philippines. It is political. It is due to the desire of some of the intelligent, restless natives to acquire control for their personal advantage. They want the offices. You will find the same thing in the United States to some extent because the "outs" are always trying to take the places of the "ins."

I do not know what would happen in India if Ghandi, who has three hundred million followers, would give the word to wipe out the 100,000 English who are in control. He is not at all likely to give the word. Apparently he is a peaceful-minded philosopher. He recently had been released from prison when I visited India. A revolution in India hardly would be successful in view of the inability of the divergent races, religions and castes to unite. The Mahommedans would go one way and the Buddhists would quite likely go another way and these are only two of the numerous religions including the Parsees, or fire worshippers. Ghandi's idea is to promote a peaceful resolution by a boycott of English goods. Advertisements are carried in all the Hindustani newspapers advising consumers to buy native products or the products of other countries but, of course, the Indians had to get a good deal of their goods from Great Britain or go without.

In every country dominated by Europeans, the natives are a thousand times better off than they would be under their own rulers. They are better fed, better housed, better educated, have better transportation facilities and more liberty. The principle of the Dutch in Java, the English in India and Egypt, the French in Algiers and the Americans in the Philippines, is to give everyone plenty of liberty as long as they do not interfere with the liberty and rights of others.

The United States has been in the Philippines for just twenty-five years. Europeans have ruled some of the other countries a great deal longer. Nevertheless the improvement we have made in living conditions, in transportation, in schools and churches, compares most favorably with that in any other country I visited. General Wood has accomplished wonders and it is a thankless task. On our homeward trip there were three hundred Americans on the Empress of Canada. One night we held a meeting and they did me the honor of electing me chairman of a committee on resolutions with L. M. Rubens of Joliet as Secretary. There was considerable talk about Governor-General Wood's administration and the attempts being made by some of the natives to overthrow him, so we passed resolutions as follows:

PREAMBLE

That to the universal spirit of unrest found throughout the more civilized world and of the Far East, the Philippine Islands are no exception;

That although the United States government has exercised sovereignty over the Philippine archipelago for only twenty-five years, as compared to the several hundreds of years other Governments have ruled in the Far Eastern countries, the comparison is most favorable;

That the American spirit of progression and accomplishment was very evident in Manila;

That its being the only Christian country in the Far East has made a vast difference in its progress and development;

That the standard of morality is very high, the resident Americans insisting upon its maintenance by example and law;

That the absence of beggars or cripples implies a healthy background, and it is a good omen;

That it is regrettable that the American press has given flagrant publicity to what is purely a political movement, a movement for ulterior purposes, financed from questionable sources;

That almost without exception the people of education, standing and means, of all nationalities, are strong supporters of American control and particularly of General Leonard Wood's admirable administration. Now, *Therefore Be It Resolved:*

RESOLUTIONS

That we fully agree with the administration at Washington in its position, as so ably set forth by President Coolidge in his reply to the resolutions of the Philippine legislature, asking for complete and immediate independence;

That congratulations be extended to Governor-General Wood on the results so evident in his conscientious and efficient administration and that a prayer be said for his good health in this trying climate and for a long life of continued usefulness;

THE TEACHER

Sixth Article on Training Factory Foremen

By J. K. NOVINS

All Rights Reserved

INSTRUCTION of foremen is either by a paid instructor hired by the company because of his technical knowledge of factory operation and experience in this kind of work, or by a member of the factory organization whose services are voluntary.

The choice of a competent instructor does not always rest with management. More often, especially in the case of voluntary ıss leaders, if the choice does not rest entirely with the men, ey are at least consulted on the matter by the management.

Strictly speaking, most foreman instructors are not "teachers." most plants where group study classes have been organized, teachers are designated as "class leaders" or "group leaders." ıeir duty is not to teach but to help the foremen study for emselves. The leader is an organizer. He acts in the capacity club chairman. By impressing his personality upon the men d exercising tact he can turn the group into an orderly study maine with all parts functioning. Otherwise there is danger that e or two foremen of more than average intelligence and the "gift the gab" will monopolize the discussion at the expense of the her foremen. The leader must help the group steer a straight urse. Many a group has hit the rocks for want of an efficient ader and because foremen began to lose interest before the urse was half finished.

In the larger plant where foreman training is a regular thing e management hires trained instructors. This is a more difficult atter than one imagines. In the case of the standardized study oup planned by an outside organization, things are so arranged at the men can take care of themselves without the aid of a ained instructor. A leader has charge of the group. But in ants where courses have been shaped especially with reference the needs of the plant, the material for study being drawn ıiefly from the experiences of the plant, the instructor assumes ore of the characteristics of the "teacher." He is expected to ganize the classes, to plan the courses and to gather the material r use in the classes. As he is on hand to see that the foremen ply the knowledge to their jobs, he must make certain that his ıstruction is accurate and practical. Otherwise the foremen will se faith in his teaching ability.

Teaching the green worker offers less difficulties, as the latter is receptive to instruction, because he realizes it will help improve his position materially. The foreman, on the other hand, often resents some one talking down to him, except, of course, when that personage is the general superintendent or some one higher in authority. Professor MacDonald of Cincinnati University, who has had a great deal of experience in organizing foremen's meetings and training instructors, summarizes the situation in the following manner. He says whenever a group of foremen gather the individual members will show the following characteristics:

1. They have mature minds.
2. They are inclined to scoff at theory.
3. They have well established habits.
4. They are largely self-made men.
5. They are self-confident, of the "show-me" type.
6. They are not usually open-minded.
7. They have never carefully analyzed their jobs.
8. They are skeptical about training courses.
9. They think best when antagonized.
10. They enjoy discussing their every-day problems.
11. They are jealous of authority.
12. They have a high regard for the square deal.
13. They may be expected to cooperate well if they have faith in the men in charge of any movement.

F. Theodore Struck, of the Pennsylvania State Department of Vocational Education presented at a meeting of the National Safety Council what he considered were the five chief points.

The first element, Mr. Struck pointed out, was the instructor's ability to do the job. This presupposed sufficient technical training to enable him to teach others. The second element was his ability to analyze the job with a view to properly presenting the salient features in his instruction to the men. The instructor should then be able to arrange the instruction in good teaching order so that the student should realize the practical application of the theory. With that should come the ability to impart the instruction effectively, and lastly, the ability to measure the results obtained.

A FUTILE CONGRESS

Tries to Please Everybody—Pleases Nobody

By JOHN M. TOWNSEND

Special Correspondent, MANUFACTURERS NEWS

CONGRESS is approaching a close of the present session with a series of legislative compromises which please nobody. Even if the session is prolonged at the last minute by a progressive republican filibuster, there is no indication that more or better legislation can be secured.

The definite announcement that Senator LaFollette is a receptive independent candidate for the presidency has only served to muddle rather than settle the political and legislative situation. On the other hand, by definitely severing the political lines under which he has masqueraded so long, the Wisconsin senator and his followers in congress have made it possible to fix responsibility hereafter, and both political and legislative strategy will now proceed on the basis of a triple rather than a double line of cleavage both in congress and outside of it.

SAYS HE'LL FIGHT

Senator Robert M. LaFollette having read the "communists" out of his third party now will turn his batteries upon the republicans and democrats unless those parties permit him to dictate their platforms—which of course they won't.

THE LA FOLLETTE ANNOUNCEMENT

Senator LaFollette's definite announcement of his willingness to lead a fight against the republican and democratic parties if they do not subscribe to his platform demands and nominate candidates satisfactory to him, is easily the most important political development in this year's campaign to date.

Already Senator LaFollette has read the "communists" out of his third party, a step which may yet prove to be only a gesture, for the "radicals" have no place to go except into the protesting third party camp. On the other hand the socialists, speaking through Victor Berger, have let it be known that unless Senator LaFollette absolutely divests himself of his republican connections, the Socialists will be forced to place their own ticket in the field. With Berger at the head of it, LaFollette would have trouble in Wisconsin.

While there is every indication that the progressive party convention at Cleveland on July 4th will be as cut and dried an affair as the republican convention so far as the certain nomination of LaFollette is concerned, the indications are that the railroad unions will be badly split if the democrats nominate McAdoo in New York and only the more radical farmers' organizations will follow LaFollette without serious and mature consideration.

EFFECT ON BIG PARTIES

Political leaders of both the republican and democratic parties are examining the LaFollette menace with care. So far as the republicans are concerned, their plans are too far advanced to permit of much change to meet the new situation except with respect to the platform and the vice-presidency. That platform cannot suit LaFollette and the vice-presidential nominee can only influence a few votes which might otherwise go to the LaFollette ticket in the midwest.

On the other hand, the democratic leaders see a distinct menace to democratic success this fall in the LaFollette move. The kind of radicals who will support LaFollette in the eastern states and in some of the western states have been voting for democratic presidential candidates for some time past. LaFollette may carry some western states which would otherwise go democratic this fall if left alone.

If LaFollette gets the railroad vote he will hurt the democrats in all the eastern railroad centers and only increase republican chances in some of the western states. As viewed here at this time, his candidacy will bring about a straightout Coolidge-LaFollette contest in Wisconsin, Minnesota, the Dakotas and Nebraska, almost totally eliminating the democrats, while his candidacy may hurt the democrats in Kansas and Montana and give the republicans a chance to win them.

It is to be taken for granted, therefore, that the LaFollette third party movement will receive far more prayerful consideration in the democratic national convention than it will in the republican Cleveland convention, but it is extremely doubtful whether either will fulfill the LaFollette demands.

The indications now are that the best the democrats can hope to do with LaFollette actively in the race will be to help him throw the presidential race into the house of representatives for final determination.

EFFECT ON CONGRESS

Undoubtedly LaFollette has a double objective in his present stand, the attainment of either of which would be a victory for him. He has no illusions about his ability to carry the country and be elected president. He would like to see the election thrown into congress where he and his followers hold the balance of power and where the minority he represents would have a voice in the final decision out of all proportion to their actual numbers.

Secondly, he is primarily bent on increasing the number of his followers in the congressional ranks, and a third party movement, whether successfully or not nationally, usually wreaks havoc on regular party congressional candidates. Running as an independent candidate for the presidency, LaFollette hopes to be able to support both democrats and republicans for congress who will vote with him later. He will amalgamate behind them all the votes he gets for the presidency and all they get for congress and claim that he and his friends represent them all in their independent attitude in congress.

For the first time since the Populist movement was at its zenith, the country is confronted by a real militant outfit intent on holding a balance of power in government. It is an attempt to lay the foundation of a liberal party in this country as opposed to the conservative elements in both the republican and democratic parties and, if it gains ground, may eventually force a realignment of all parties on liberal and conservative lines. If it "blows up", as third party movements have disintegrated heretofore, that realignment will be postponed another decade or so.

Nevertheless, with business men generally refusing to contribute to the coffers of the republican and democratic congressional committees this year in punishment for the failures of congress to enact good legislation and to follow its chosen leaders, the

LAW MAKIN'

A Review of State Industrial Legislation for the First Four Months of 1924

Prepared by M. J. HICKEY
Assistant Secretary, NATIONAL INDUSTRIAL COUNCIL

OUR great American penchant for law-making is once again demonstrated by the enormous volume of legislation introduced and new laws enacted the 1924 sessions of our State legisla- ɜs. With only eleven regular State ses- ıs and a few special sessions scheduled this comparatively "off-year", the crop bills introduced, by the end of April, l reached 15,560 (in 10 States), and no ; than 3,378 new laws (in 10 States) had n added to the statute books. These ıres do not include two regular sessions eduled to begin in May and June in uisiana and Georgia, respectively.

ollowing is given an authoritative tabu- ion of the number of bills and resolu- ns introduced and the number of new vs enacted to date in ten of the States of ich legislative sessions have been held or still in session this year:

	Bills Introduced	Laws Enacted	
Iowa	257	215	
Kentucky	1081	226	xx
Maryland	1055	539	
x Massachusetts	2040	263	
Mississippi	1586	724	
New Jersey	864	270	
New York	3467	658	xxxx
Rhode Island	823	—	xxxxx
South Carolina	3217	—	
Virginia	1170	483	
Totals	15,560	3378	

x Special Code Revision Session, ended April 26th.
xx Includes 110 "road project measures.
xxx Up to April 14th; session still on.
xxx Approved Chapters of 1924 up to May 7th.
xxx Prolonged filibuster delaying action.

In the following will be found detailed ports from the various States concerning e enactment or defeat of measures of im- ortant interest to industry:

)WA

In Iowa, the main interest of the indus- ial elements was concerned with several de revision measures, the results of which ropositions may be cited as follows:

(a) Defeated an effort by the coal miners' ion to compel gypsum mine operators to mply with regulations governing coal ines. This proposal was sponsored as a eans of retaliating for the victory achieved y the gypsum operators in a strike during 922.

(b) A decisive victory was won over everal drastic proposed amendments to the orkmen's compensation law.

(c) Every objectionable feature of pro- osed changes in the health and safety ap- liance laws of the State was successfully liminated.

(d) Successfully joined hands with organized labor in revising the contract convict labor laws by adopting a partial "State Use" plan along the same lines as New Jersey.

The only defeat inflicted on the industrial interests was the enactment of a bill imposing a tax of $6 per annum per product on manufacturers of stock remedies. Even in this setback however, a partial victory was won in amending the act so as to avoid a proposed $100 annual fee.

KENTUCKY

A total of 1081 bills were introduced of which grist 226 laws were enacted. The total of enacted measures, however included about 110 so-called "road project" measures and can hardly be fairly called new statutes.

The outstanding enactment of the 1924 session, of vital interest to every Kentucky citizen as well as its industries was an "*Administration Tax Bill.*" The bill in its original form was probably the "most dangerous" measure of its kind ever offered for passage. Despite a well planned effort by its supporters to "railroad" the bill into law, several of its most drastic features were successfully eliminated through the work of the Associated Industries of Kentucky. As finally enacted, the tax measure resulted in the following principal changes in Kentucky's taxation law.

(a) *Real Estate,* including farm lands, town lots and improvements, coal, oil and other mineral rights and leases; old rate 40c; new rate 30c.

(b) *Personal Property,* including tangible and intangible; old rate 40c; new rate 50c.

(c) *Live Stock and Poultry;* old rate 10c; new rate 50c.

(d) *Additions to Property Exempt* from Local Taxation; Live-stock and poultry; unmanufactured articles in hands of producer or any agency for the purpose of sale.

(e) *Shares of Stock* in any corporation with less than 75% of its taxable property in Kentucky must be listed for taxation and pay at the new rate of 50c as other intangibles. The old law required listing for taxation only of stock in corporations having less than 25% of their taxable property in Kentucky.

(f) *Corporations* having less than 75% of their taxable property in Kentucky must file with the State Tax Commission on or before August 1, each year a list of names and addresses of all residents of Kentucky who held shares of stock or outstanding bonds as of July 1, and also the transfer of any of their stock or bonds by residents of Kentucky to non-residents within thirty days previous to July 1.

(g) *Bank Deposits* tax rates remain at 10c, as in the old law, but report must be made as of July 1 instead of September 1.

Other important measures affecting the industrial interests of Kentucky, which were enacted, may be summarized as follows:

FIXING REGISTRATION FEES FOR MOTOR TRUCKS. This bill was introduced within six days of the close of the session. The new law reduced the fee on trucks of 1,000 pounds capacity or less from $22 to $20; the fee on trucks of upwards of 1,000 up to 2,000 remains at $30; trucks above 2,000 up to 3,000 pounds, $55, instead of the present $40; trucks above 3,000 and up to 4,000 pounds, $70, instead of the present $50; trucks above 4,000 and up to 5,000 pounds, $85, instead of the present $60; trucks above 5,000 and up to 6,000 pounds, $95 instead of the present $70; trucks above 6,000 and up to 7,000 pounds, $125, instead of the present $90; trucks above 7,000 and up to 8,000 pounds, $150, instead of the present $110; trucks above 8,000 and up to 9,000 pounds, $185, instead of the present $130; trucks above 9,000 and up to 10,000 pounds, $215, instead of the present $150; trucks of more than 10,000 pounds capacity, $215, with $20 for each additional ton, instead of the present $150 and $50 for each additional ton.

INCREASING THE TAX ON GASOLINE. This bill raises the gasoline tax from 1c a gallon to 3c. The tax is to be paid monthly by the wholesaler and the revenue derived is to be devoted to construction and maintenance of roads and to payment of interests on State bonds or creation of a sinking fund for their liquidation. The following states are said to have a 3c tax on gasoline: Arkansas, Florida, Georgia, North

Carolina, Oregon, South Carolina and Virginia.

REORGANIZING STATE DEPARTMENT OF LABOR. This law provides for appointment of a Chief Labor Inspector, who may be either a man or woman, at a salary of $3,000 per year, and two women and two men Deputy Inspectors at salaries of $1,600. Applicants for the positions must stand competitive examinations.

The inspectors are empowered to visit places of employment for the following purposes: (1) the investigation of the condition of employment affecting the life, health, safety of employes; (2) the administration and enforcement of all laws of the State regulating the employment of labor; (3) the collection of statistics pertaining thereto. An employer on request is to be given a detailed report of the inspection of his establishment. Complete and permanent records are to be made of all investigations and of changes ordered. An employer interfering with the performance of official duties by an inspector is subject to fine or jail sentence, or both.

Section 11 of the law provides: "Every person, firm or corporation shall within one month after he, they or it shall begin to occupy a factory, workshop, mill or other place of employment notify in writing the Chief Labor Inspector, Department of Labor at Frankfort, of such occupancy, giving the legal title of such corporation and name of agent upon whom service of summons can be made and in case of firm, the individual names of members of the firm and its legal title."

The law, which carried an emergency clause and is now in effect, provides that the two labor inspectors and two assistants holding office at the time of passage of the act, may be appointed Deputy Labor Inspectors without submitting to examination.

AMENDMENTS TO WORKMEN'S COMPENSATION ACT. This bill amends the Workmen's Compensation Law by providing that an employe submitting to an operation for hernia shall be entitled to compensation for his actual disability following such operation, instead of compensation for 26 weeks as provided by the present law. It also provides that a minor who has procured his employment through the misrepresentation of his age through his parent or guardian shall be deemed sui juris for the purpose of the act and no other person shall have cause of action by reason of the minority of such employe. Another provision is that no lump sum settlement shall be reopened after more than one year from the date of its approval by the Board. Section 30 of the law is amended to read as follows:

"In case any minor employe who is injured or killed is, at the time of such injury, employed in wilful and known violation by the employer of any law of this State regulating the employment of minors, his statutory guardian or personal representative of the minor so killed, may claim compensation under the terms of this act or may sue to recover damages as if this act had not been passed. Provided, however, that in case a minor under 16 years of age who procures his employment through the misrepresentation of his age through his parents, guardian or one having legal authority over him, his parents, statutory guardian or personal representative of a minor who is killed cannot elect to claim either compensation under the terms of this act or sue to recover damages as if this act had not been passed, but he must rely on his claim, if any he has, for compensation under the terms of this act. If a claim to compensation be made under this section, the making of such claim shall be a waiver and bar to all rights of action on account of said injury or death of said minor as to all persons, and the institution of an action to recover damages on account of such injury or death shall be a waiver and bar of all rights to compensation under this act."

The present law is also amended to provide for the Board's removal of any Medical Director who, during the term of his employment, accepts or receives remuneration for any services in any matter arising under the act or which may come before the Board of adjudication.

Several important measures sponsored by labor and so-called "welfare organizations" were defeated during the session. Among these may be mentioned an old age pension proposal; State supervision and inspection of all paint jobs which would have made "paint inspectors" as numerous as radio fans; an anti-rent profiteering bill which would have punished every landlord collecting a greater monthly rental than 1 per cent of the listed value of property rented; a drastic "truth-in-fabric" bill; a state bond issue of $10,000,000 to provide bonuses for soldiers and war nurses; and a bill to set aside June 14th (Flag Day) as a legal holiday.

MARYLAND

A total of 1055 bills were introduced in the 1924 session of the Maryland Legislature. Of that number there were 604 passed by both houses. By executive veto 65 were eliminated, leaving a total of 539 new laws enacted.

The industrial interests were successful in opposing every objectionable proposal. Among those which were defeated were a number of workmen's compensation amendatory bills including a proposal to entirely eleminate the waiting period and another requiring all insurance to be taken out in the State Accident Fund.

Other rejected measures were: a bill to promote a more economical method of marketing farm products; assignment of business accounts; changing the tax on banks and trust companies; a number of bills which would have inflicted great burdens on financial institutions and insurance companies; and a bill providing for collateral inheritance and poll taxes.

MASSACHUSETTS

Up to April 14th, the Massachusetts Legislature of 1924, had received a total of 2040 bills, some of which, however, were re-drafts of original bills. By the same date Governor Cox had signed 246 Acts and 17 Resolves, making a total of 263 enacted measures.

Among the bills offered, forty sought to amend the Workmen's Compensation Act in a variety of ways, such as increasing the maximum and minimum payments, eliminating the waiting period entirely, establishing a state fund similar to the Ohio plan, providing for the payment of attorneys' fees, increasing the period of medical attendance, adding to the number of specific injuries, increasing the amount of burial allowance, and eliminating the waiting period when total incapacity extends over a period of twenty-eight days.

The only measure of this group to survive was the last named and that has become law. *The reduction of the waiting period from 10 to 7 days, enacted last year, has increased the cost of workmen's compensation in this state about $350,000, and it is estimated that the new law will cost an additional $250,000 annually.* As a purpose of the waiting period is to prevent malingering, it was contended that if an employe was actually totally incapacitated for four weeks the element of feigning had been removed. This argument prevailed.

In the realm of "labor and wages," there were some interesting proposals. The textile people sought to be relieved from the burden of shorter hours than those imposed by competing states. Massachusetts does not permit women and minors to work longer than 43 hours a week, while competing states allow 54 and more. Here, also, there is a discrimination against the textile industry, in that women and minors cannot be employed after 6 P.M. Three bills were presented—one to repeal the 48 hour law, one to suspend its operation for four years (perhaps with the thought of federal legislation), and another to repeal the 6 o'clock prohibition. These measures, however, were given scant consideration and failed.

The annual attempt to increase the compulsory school attendance age from 14 to 16 years was defeated again despite a deal of propaganda in its favor. Industry did not approach this question as an industrial, but rather as an educational one, pointing out that our present school system had not demonstrated sufficient benefit to warrant compulsory attendance for two additional years. The Legislature did, however, adopt a resolution memorializing Congress to submit an amendment to permit the enactment of uniform child labor laws.

Measures looking to the establishment of a 44 hour week for certain public employes and in connection with the state printing and binding were defeated. A bill (similar to the New Jersey law) providing that parties to a contract may agree in writing that any controversy thereafter arising under the contract shall be arbitrated failed of passage.

There is a bill, still in committee, which would establish a fund, with an initial appropriation of $50,000, to provide employment in times of industrial depression. It suggests a program for future public works.

While there were eight petitions to make

THE HUMAN ELEMENT

The Obligations of Employer and Workers in Successful Production

By ARTHUR H. YOUNG

Manager, Industrial Relations, International Harvester Company

Continued from last week.

ne time, out in a western steel works, my job was in the rail l. One day a notice went up on the bulletin board saying ly that, effective at such and such an hour of that same day, mill would be shut down until further orders. Just that and more—"until further orders."

bunch of us got together at the lunch hour in the riggers' nty and, of course, we talked about the shutdown. There were ost as many theories about the cause of the shutdown as there e men in the group. Finally, one old, wise hand said he knew reason. It was because we were using an inferior coke and had resulted in producing rails that wouldn't stand up. Our pments had been refused, contracts had been cancelled and y the good Lord knew when, if ever, the mill would start up in.

ersonally I happened to know that the only reason for the tdown was the fact that the soaking pits needed to be relined that in ten days, at the outside, the mill would resume opera- n. I was, however, old enough to know that I was too young any statement of mine to have any effect on that hard-boiled ch and I kept still.

Well, in ten days the soaking pits were relined, the mill was dy to resume production, and the men were called back—but t all of them, for quite a few, and desirable workers at that, moved on, rather than hang around waiting at a gate which, all they knew, might never swing open again.

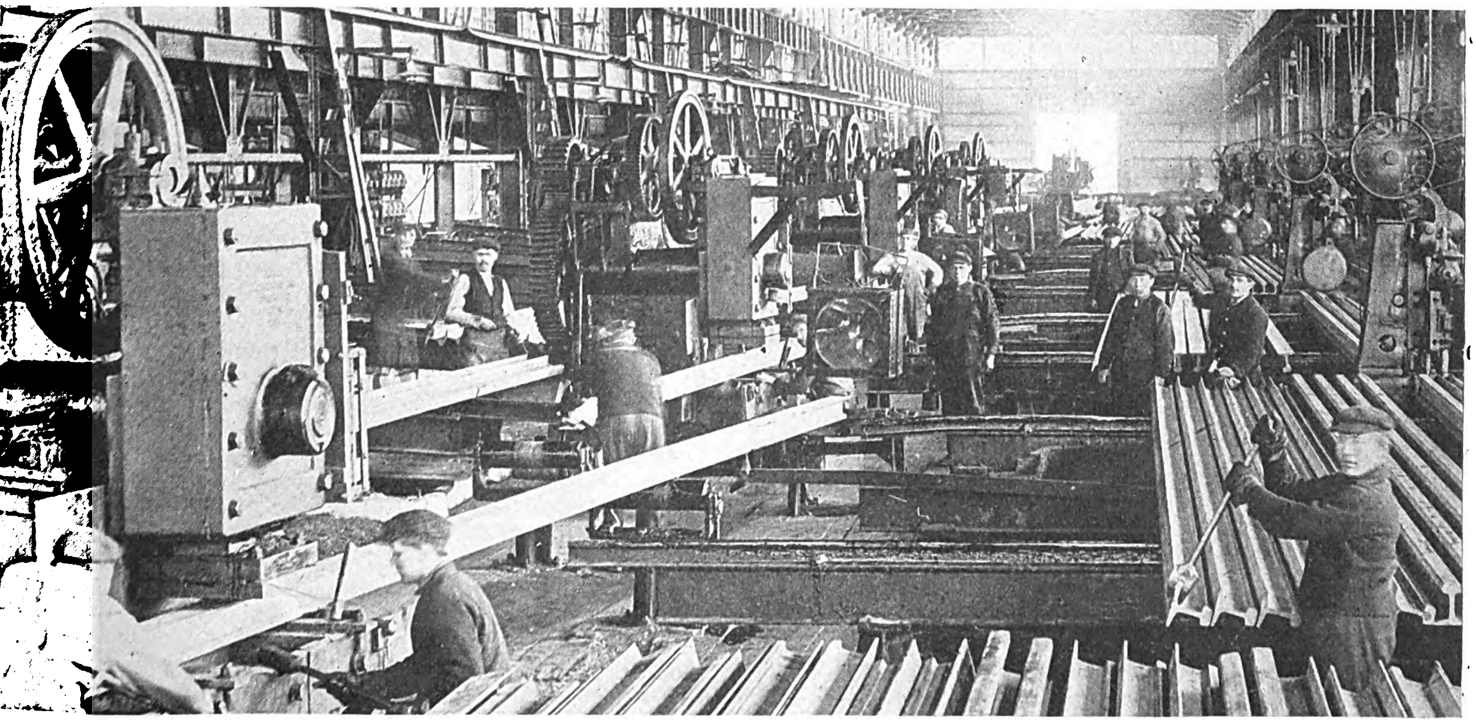
How easy it would have been for the management of that mill have put up a bulletin saying that the mill would shut down, t "until further orders," but until the soaking pits could be ined, or the foremen could easily have passed the word down line that the shutdown would last only a few days. But that s not the way factories were run in the days when I packed a ch box and a brass number check.

A few years ago, when American agriculture suddenly struck a long down grade and the agricultural implement business went plunging down hill close behind it, it was part of my job to help in the unhappy business of putting the brakes on a big productive organization that was running on the high gear. During that experience I often contrasted that experience in the rail mill with the somewhat comparable situation that was now in hand.

The Works Councils were fully informed of what the management felt sure was going to happen. Employe representatives were called upon to find out in each of the plants in what ways their constituents would prefer to have the week and then the working day shortened as production was curtailed. Weeks and even months before a plant completed its diminished schedules the councils and every employe were notified that, under the stern compulsion of business necessity, forces must be reduced at many of the plants to a point that would practically mean suspension of operations.

All hands were furnished with printed statements of the causes and were asked to register and to keep in touch with the plant so that when operations were resumed they might be called back to their jobs. In some plants individual cards were issued to employes stating the reasons for their unemployment and commending them to any other employer who might be able to use their services.

Years ago, when I worked with my hands in a steel mill, I began to think that the average American workingman does not want anybody's charity, and least of all his employer's, but that what he does want is an even break on his job, that a 50-50 relation with his employer is as important to him as wages, and maybe more important. Later, as I moved slowly up or along toward and into the management side of productive industry, this thought became a belief. Now, after some years of witnessing and participating



opyright by Ewing Galloway

Straightening Rails in Rail Mill, Bethlehem, Pa.

in a system that promises, gives and guarantees that even break, that 50-50 relation, I know that this is true.

Given and assured of industrial justice—if you will accept that term—there is nothing more needed to produce industrial harmony in its highest sense. And, mark you, my friends, there is nothing less or nothing else that will do just as well. There is no substitute for justice. You cannot put wages enough into a pay envelope to make a happy, contented and successful worker out of a man who feels that he is being imposed upon, that he is being denied his rights, that somebody else is getting more pay for less work or less valuable work, or is getting privileges and opportunities of any kind that are denied to him.

Neither can you strain the quality of the industrial justice as expressed in employe representation and hope to have it pass for what it is not. Probably one of the principal reasons for the failure of many early and some more recent plans of employe representation has been their effort to camouflage, to disguise and to avoid—to make the employes think they were participating by their representatives in shaping the industrial policies and determining the industrial conditions under which they were to live and work, when in fact these representatives were, in truth, mere spectators and not participants.

It is now quite the custom and the fashion to be open and frank and inclusive about the main controversial questions of the industrial relation. Only five years ago it seemed like a boldly progressive and even radical step when the Harvester Company, in putting out its Industrial Council Plan, expressly included the questions of wages, hours and working conditions as subjects for the debate and determination of the Works Councils. A bold and a long step forward, but experience has proved and justified the theory on which it was taken.

Nowhere, in all the long list of questions that have been decided by Harvester Works Councils, has the principle and practice of employe representation functioned to better mutual results than on these same subjects that used to be fighting issues.

I have seen men march into the council room with their minds and the minds of their constitutents fully made up that they must have a wage increase. I have watched these men and listened to their questions as the officers—sometimes the President of the company himself—have given them the facts and explained to them the reasons which made it impossible to meet their demand or to give any increase; and I have seen and heard these men, sometimes after long deliberation among themselves, as they admitted the soundness of the Company's position and manfully accepted it.

Again, I have seen what amounted almost to the diametrical opposite of this situation—the management listening to the men explaining and then yielding in the selfsame spirit. But I have only seen a few deadlocks in all these five up-and-down years since 1919, and there was not one of these few that failed of direct settlement, not one that brought us to the ultimate recourse of arbitration.

There is something in the principle of employe representation that appeals to the worker, I think, quite apart from the results that it brings on his side of the equation. Consciously or unconsciously, we Americans carry deep in our hearts at least one of the ideas which made us a republic. There is something about the American mind—possibly a tradition that has become an instinct —that makes us rebel down in our hearts against the idea of working *for* another man and makes us happy to feel that we are working *with* him.

Have you ever noted that the word "servant" has almost disappeared from the American branch of our English language? You may have a maid in your American household, but if you call her a servant you are very likely to find yourself doing your own housework or looking for rooms in a hotel. You wouldn't get very far in this generation in America if in the speeches of your officers or in your company literature you spoke of your employes as servants, or if you put in any reference to the relation of master and man.

Sprung from the same tradition is an inborn and instinctive hostility against any sort of government without the consent of the governed. That inborn, instinctive feeling is, I believe, just as strong in the mind and heart of the workingman with respect to his employment as it is with respect to his government. He doesn't like the idea of giving his life and work to a business that will not give him any voice in shaping the policies and determining the conditions under which he is to do his share of the work.

Sometimes I have heard a whisper of doubt here and there about the application of these American ideas and principles to great numbers of workingmen who are not Americans in any sense except that they live and work in America.

There are some who question the fitness of men who have never known the freedom of our form of government to take part in a highly comparable scheme of industrial freedom. These doubters draw a distinction between the American-born or the American of long and proved adoption and those among us who have not yet become citizens, or have not been citizens long enough to find their own way around in the corridors and committee rooms and court rooms and legislative chambers of our temple of liberty.

Candidly, I haven't much patience with that sort of doubt if it is to be applied as a limiting factor in employe representation. My experience and observation confirm the theory that there is in the heart of the newcomer from overseas a more passionate desire for everything that goes with American freedom than in the heart of the average American who enjoys all those things simply by virtue of being born where he was born.

Turning a little aside from our theme for just a moment, it seems to me that those of us who were born into our condition of freedom—those of us who are fortunate enough to have had ancestors in the long ago with the knowledge, the ambition and the aspirations that made them pioneer Americans—to put in a little practice along with our precepts about Americanization.

I sometimes wonder what the alien who has lately arrived in this land of the free thinks about it and us when he sees a good many of us, in high places as much as in low, taking our obligations of citizenship so lightly. It seems to me that while we are preaching and legislating so strongly for the Americanization of the stranger within our gates, we shall do well if we give a little thought to the example we are affording him of what he should do with his American citizenship when he gets it.

You will find doubters, too, who are slow to believe that the principle of employe representation can flourish or survive in the presence of an active and aggressive labor unionism. Let me say here that any quarrel I may personally have with unionism is not with its ideals and purposes, nor with its leadership, but only with those who would mislead and betray it—only with those who can see in the industrial relation nothing better than armed camps; only with those who would selfishly use labor organizations for the purpose of keeping employer and employe apart, whereas the purpose and the effect of employe representation is to bring them together.

There is nothing incompatible to my mind, between unionism and the employe representation that brings the employers and employes of a plant or a company or an industry into a situation of mutual confidence, respect, good will and effort. In the works councils which I have been watching and working with for these last five years, there are and have been many men carrying union cards and I have not observed that any of these has fallen below his non-union fellow employes in his acceptance of the principle and the practice of the councils, or in striving to bring them to their highest development and best results.

Purposely I have kept away until now from direct reference to the obligation of the employer in securing and preserving the point and the means of contact which, as I have said, find their only practical and workable expression in employe representation.

There is no question about the obligation in the industrial relation between employer and employe being as mutual as the results which it is expected to deliver. Confidence is begot only by confidence and respect by respect. Yet I cannot help believing that the obligation of the employer in the establishment and in the preservation of this point and means of contact which we have been speaking of is greater than the obligation of the employe—is vastly greater.

Logically it must be so, because the powers and the opportunities of the employer are so much greater than those of the employe.

The other day I saw in a newspaper an expression which, though

A FUTILE CONGRESS

Continued from Page 8

Follette menace toward congress is a source of considerable rry just now to the members who are "in bad" with their ıstituents.

JOCKEYING FOR POSITION

Within the week the contending factions in congress must show ·ir hands definitely on the questions of legislation and adjourn- ·nt. The present indications are that President Coolidge will n the tax bill and, at the same time, indicate his displeasure th it. If he does sign it it will be solely because it is better law ın the existing hodge-podge tax law and no better can be got t of this congress if it sat in continuous session forever.

The McNary-Haugen agricultural relief bill is still on the gislative rocks and will stay there unless, under the urging of president, some form of an acceptable compromise can be d.

The Howell-Barkley railroad bill is also in trouble. Both of ese measures are LaFollette "pets" and they may become the nter of the storm around which the question of final adjourn- ent of this congress will be waged. LaFollette, who has been sting at Atlantic City after his recent illness, will stalk in on the scene to determine whether he and his followers will ibuster against adjournment or submit to it.

Senator Brookhart has said that the progressives oppose ljournment because they are opposed to leaving President olidge in Washington with all methods of publicity at his mmand whereas the progressives can only broadcast their position and their views nationally through their activities in ngress. It is doubtful whether any delay in the adjournment congress which has for its purpose such a motive as that will t well on the tax-payers who are already tired of being lam- sted at their own expense by the democratic-progressive position. Most of the democrats want to quit congress now ıt they cannot prevent their allies from talking congress into prolonged session.

WORLD COURT FIGHT

In his Memorial Day address President Coolidge went out of is way to reiterate for a third time his view that the United tates should adhere to the World Court along the lines originally roposed by President Harding. In view of the fact that the publicans in the senate have only recently got behind the Pepper mpromise plan—not with a view of passing it at this session but nly for the purpose of confusing the issue in this campaign and muddle up the republican platform plank on that question— e determination of the President to stand by his guns means a raightout fight over that plank at the Cleveland convention.

Undoubtedly the rank and file of the smaller politicians in the onvention would ordinarily favor any straddle of the issue which ould relieve them and the congressional candidates of the ecessity of "explaining" anything on the court issue, but they ill find themselves confronted with the necessity of nominating alvin Coolidge almost unanimously and then will come the uestion of whether they will stultify him and the party by ledging a court position which the candidate does not believe in.

As has been repeatedly said before, President Coolidge does ot change his mind. If he believes a thing he opposes every- hing else in conflict with it, and he would not hestitate to tell the ountry that any world court plank along the lines of the Pepper ompromise is not in his personal platform. Most of the senators vho voted for the Pepper plan in senate committee are delegates o the Cleveland convention and will fight the President under over all they can, so that a pretty row over the platform is in ight.

Continued from Page 7

"Instruction from the production standpoint is of value only in so far as it results in achievement on the job," Mr. Struck concluded. "This final step of checking up the effectiveness of instruction is important."

In addition to a knowledge of the subject and the methods of its presentation, the instructor must be able to measure the individual capacities of the students. He must gauge this by the students' educational records, their working and home conditions, and their progress during the course of study.

Regularly employed instructors are allowed a great deal of free time. The factory management considers it a narrow policy to load the instructor's time with a lot of class duties. The instructors are expected to gather material for their courses in the plant proper. They collect actual problems from the experiences of the plant executives and the workmen. They must have plenty of opportunity to mix with the men, to learn their viewpoints, and to find out what are the most pressing needs of the foremen. In one plant three instructors are employed, with a staff of assistants to follow up the work of the students. Most of the instructors' time is spent outside of classes—learning the production and administrative problems, gaining contact with the executives to determine weak cooperation by the foremen and to find out how they could and should be remedied, and in gaining actual contact with the foremen themselves to determine whether the instruction is being properly applied.

When an outside instructor is hired the management takes pains to first put him through the factory for a reasonable period of time so he may become acquainted with the firm's policies and problems. He then becomes a valuable instructor, respected by the foremen. They share the benefit of his experiences in many plants. On the other hand, the instructor taken from the organization is apt to be limited in his scope of understanding, judging applications solely upon the experience of that one firm. An ideal instructor is one who has studied the problems of a number of plants from first hand experience and contact and is trained to analyze his information with respect to definite applications. The necessity of acquainting the outside instructor with the workings of the plant was shown by the experience of one plant where the training course failed because the instructor did not have a first-hand knowledge of the problems arising in the particular plant.

The case is easier analyzed than solved. There is an actual dearth of foremen instructors qualified by both experience and teaching ability to conduct a course properly. Modern industry has not yet developed the efficient foreman instructor, though there are plenty of good instructors to "break in" the green worker. Very few men are endowed with all the qualities requisite to the instruction of the experienced, hard-headed, practical, veteran factory foreman.

This problem is solved in some plants by resorting to the committee system. A committee is formed, consisting of the plant manager, a super-foreman, the employment manager and a good instructor. This committee is endowed with all the qualities of an all-round foreman instructor. It plans the course and supervises the instruction. And one of the men, usually the instructor, is called upon the execute the principles decided upon by the committee, or the members of the committee alternate as leaders, or the committee chooses an outside leader.

More often, especially at group meetings, the employment manager supervises. The employment manager is the logical person, as he is supposed to look after the interests of the men with a view to effecting greater cooperation with the management. In plants where the training is under the supervision of a regular vocational training department the supervisor of instruction often acts as leader of the group.

While desirable in many respects, it is not always advisable to have the employment manager, or the supervisor of instruction, to act as class or group leader. In the presence of authority the men might not feel free to express their candid opinions and relate their true experiences, especially if these experiences should reflect on their efficiency. Every good instructor knows that the best way to reach the student is to first learn his deficiencies. If the foremen relate only their feats and pleasant experiences, most of which might be inconsequential, and deliberately hide their man-

WILL ORGANIZATION DO IT?

ACCORDING to Chairman Hall of the Interstate Commerce Commission the shippers and consumers of the country during the last eighteen months have paid nearly $800,000,000 less in charges for transportation of property than would have accrued if no reduction had been made below the basis of August 26, 1920.

Referring to the net effect of the changes which were made subsequent to June 24, 1918, he says the result was to increase rates in the eastern group alone 57.5 per cent; in the southern and mountain Pacific groups 40.5 per cent, in the western group 52 per cent and on inter-territorial traffic 50 per cent.

He estimates that more than $175,000,000, or about 22 per cent of the total, represents decreases in freight charges on live stock and products of agriculture. The latter according to Mr. Hall constitute approximately 15 per cent of the tonnage.

It would seem that the railroads have done fairly well to pay the wages they have in the last eighteen months and at the same time reduce to some extent freight rates. The question is how to get the agricultural producers on a parity with the transportation, and other industrial units. Will organization do it? The farmers are producing more than the country can consume.

A WEAK COMBINATION

SOME of the scintillating stars of the Farmer-Labor movement refuse to twinkle in a red firmament. Senator Robert M. LaFollette still loves the farmer but not enough to approve the Farmer-Manufacturer Progressive Convention called to meet in St. Paul on June 17. He shies off from any Farmer-Labor movement that appears to be dominated by communists.

John J. Fitzpatrick, president of the Chicago Federation of Labor also has withdrawn his allegiance from the Farmer-Labor party. It didn't pay.

The Farmer-Manufacturer Convention held in Chicago last January under auspices of the Illinois Manufacturers' Association probably did more to dampen the ardor of the attempt to combine farmers, trade unionists and communists than Red propaganda or anything else. The truth is, the more progressive farmers—the successful ones, the thinkers—never did take any interest in the Farmer-Labor enterprise. Why should there be a combination between farmers and trade unionists or between farmers and communists?

The farmer is a property owner and although he sometimes finds it hard to agree to this, he is a capitalist. He is for law and order. He is conservative by instinct and choice. There is no reason why a farmer should be for higher taxes and higher labor costs. If he is a consistent believer in some of the doctrines of the Farmer-Labor party, he is for inflated wages and confiscatory taxes for all property owners. The farmer is not a fool.

AN AVALANCHE OF LAWS

OUR people are suffering from the burden of too many laws, most of them half baked measures. Secretary of State Hughes recently pointed out that our annual average addition was 12,000 statutes and 13,000 decisions of the courts of last resort.

James A. Emery, Counsel of the National Industrial Council, points out that the last few months have offered accumulated evidence of this primal difficulty. Eleven state legislatures have been or are sitting. The Sixty-Eighth Congress which will adjourn this week has produced substantially 12,300 legislative proposals, including 96 propositions to amend the constitution. There were seventy measures relating to immigration alone and an equal number relating to transportation introduced in either house of Congress.

A good many of the bills introduced in Congress or in the State legislatures are for the purpose of advertising the authors of such measures. Representatives feel that they must do something to show the folks at home that they are alive and kicking and most of them are under the impression that the more kicking they do the better.

Meanwhile, the average citizen has to struggle along to earn the money to pay the excessive cost of federal and state governments. From 1910 to 1916 the cost of the Federal government for all purposes ranged from $6.50 to $7.00 per capita. For 1923, we spent just about that much per capita for pensions and care of soldiers alone. The interest we paid on the public debt ($8.83 per capita in 1922) was more by one-fourth than the total per capita cost of the Federal Government before the war.

What we need is less laws and more economy.

EXPLOITING THE MINERS

ACCORDING to the official census, the membership of the United Mine Workers of America in Illinois is 100,000. This is double any other district under the jurisdiction of the mine workers and is practically one-fifth of the entire membership of the United Mine Workers of America.

Less than half of this army of miners is at work. Illinois mines cannot compete with non-union mines in neighboring states where the scale of wages is not so high and where efficiency is greater. When the 100,000 miners are at work each one has to contribute a good share of his wages to the United Mine Workers of America. The money is taken out of his pay envelope under the check-off system. Naturally, officials of the union in Illinois are reluctant to release their hold on the rank and file of this great revenue producing body.

Coal mining in Illinois would be much more profitable for the miners, the public, and the mine operators if conducted on an open shop basis as it is in Kentucky and West Virginia.

AN INDUSTRIAL OPTIMIST

JUDGE Elbert H. Gary, chairman, United States Steel Corporation, is an optimist. That is one reason why he has risen from the position of an attorney at Wheaton, Illinois, to one of the great industrial leaders of the world. In his talk before the American Iron and Steel Institute on May 23, he said:

> "To say business is entirely satisfactory would be to offend my sense of truth and propriety. To say that we are not producing more than three-fifths of what we were at the height would be only stating a fact. Conditions at Washington have not been satisfactory. Although I have nothing to say against individual Congressmen, I fear that some Congressmen have not been inspired by motives in the interest of the country as a whole, but that politics has entered into their plans.......This country is not going into the hands of a receiver. We have a bright future before us. We are too rich, too strong and there is too great a demand for the necessities to ever allow us to sink into a depression."

Cunard Sailing Dates

The Cunard Steamship Company and the Anchor and Anchor-Donaldson Lines announce the following proposed sailings: *New York to Liverpool*: Laconia, June 7; and July 12. Scythia, June 19; and August 23. Carmania, July 5. *New York to Glasgow*: Cameronia, June 7 and July 5; Columbia, June 14 and July 12; Assyria, June 21; California, June 28. *New York to Southampton*: Berengaria, June 4; Mauretania, June 11; Aquitania, June 18. *New York to London*: Vasconia, June 7; Verentia, June 14; Saxonia, June 21; Vardulia June 28.

IGHT MILLION HORSE POWER

Predict 186 Per Cent Increase in Electrical Power for Illinois, Wisconsin, Indiana, Ohio and Michigan by 1950

WITHIN less than thirty years—or by 1950—the "Work Shop of America," which had a population of 8,600,000 in 1920, will have a population of approximately 12,940,000 and for each 1,000 persons of this population there will be available 638 horsepower of trical energy with which to do the "work shop's" work.

his prediction is based on a survey which has extended over eriod of nearly four years throughout the "work shop"—ch includes the northern halves of Illinois and Indiana, southtern Wisconsin, northwest Ohio and the southern end of higan.

he survey, conducted in conjunction with the United States nsus Bureau and a score of other authoritative agencies, has n directed by the Power Survey Committee of the Great Lakes tion of the National Electric Light Association. The committee eaded by R. F. Schuchardt, electrical engineer of the Commonalth Edison Company, Chicago.

The committee states that there is no reason for laying out a w so-called super-power scheme in the area, inasmuch as that ich has been in development over a number of years will meet cessities if there is continued cooperation between electric comnies as respects inter-connection of lines and "pooling" of power cilities. The report says, in part:

"It is recognized that what is commonly termed 'super-power' s been with us many years. It is no new development. Intermnections and the replacement of service from uneconomical all stations by service from transmission systems were made a arter of a century ago and have continued ever since. Intenve work of this kind in Europe since the war, resulting in a easure from a study of American systems, and the naming of rge systems over there 'super' systems, coupled with the 'superower' survey of the North Atlantic states have awakened a popur interest in the subject. The lack of general knowledge of what e industry has already done and the belief that an unused river an be harnessed with resultant cheaper power have caused an ntirely wrong view of the situation to be generally held.

"Population in the area, is expected to increase from 8,600,000 n 1920 to 12,940,000, an increase of 51 per cent. The installed lectrical horsepower in the area, in all industries, was 2,862,000 n 1920, or 340 horsepower per 1,000 of population. This is stimated to reach 8,196,000 horsepower in 1950, or an increase of 86 per cent.

"Although some localities have recently shown a decrease in opulation, it is thought that no sections are likely to continue to lecrease. It is believed that the use of electricity in the small owns and rural districts is making living much more agreeable and the extended use of electricity, which the present development is bound to bring, will make conditions in these places much more attractive. The fact that many people in the large cities are dissatisfied with city life and will readily be drawn back to the rural districts when more of the advantages of the city are there, without the disadvantages which come from crowded living, crowded transportation and intensively competitive working conditions, will make the country districts gain population faster than heretofore.

"The present high development of the electricity supply is due to earnest and intelligent work in the past. It has progressed along sanely conservative lines. The problem of wise planning is not only a technical one of electricty generation and distribution but involves study by the economist. The central station systems are rapidly expanding and already great net-works of transmission lines cover a large part of the country. This development is particularly intensive in the northern Mississippi valley and in the region of the Great Lakes where the electrical load is growing rapidly.

"Interconnection between adjoining systems bring distinct advantages to the public served but to get the greatest benefit from them the extensions of such systems must follow a coordinated plan. In addition to the engineering and economic problems there are intercorporate, financial, legal and commercial problems to solve to carry out the plan fully."

In making its predictions for 1950, the report states that "while revolutionary changes are always possible, particularly in such a field of applied science as electricity," certain fundamental assumptions have been arrived at as follows:

> "The power stations of the future will be much like those of today but with improved efficiency of generation.
>
> "Water powers will be developed wherever such development can be economically justified and is in the public interest.
>
> "Ninety per cent of all industrial power in the Area and all the power required by urban and interurban railways will be supplied from central station systems.
>
> "The general rate of increase in population in the Great Lakes Division for the next three decades (from 1920) is estimated at 13.3 per cent, 11.8 per cent and 11 per cent respectively. This allows for a reduction in immigration as compared with past decades. The increase of population in the whole period from 1920 to 1950 is estimated to be about 51 per cent.
>
> "Railroad electrification in the area will probably have progressed to include all the terminals in the Chicago district and perhaps the Divisions terminating in Chicago.
>
> "Electrification of rural districts will reach a state equal to that where intensive experimental work along this line has been done. The energy demand, the report states, will be approximately 5.8 kilowatts per square mile of farm.
>
> "Residential consumption is expected to average about 400 kilowatt-hours per family per annum, with load factor around 9 per cent, or a demand per family of about 0.5 kilowatts. Small business lighting and power will have average demands in different localities varying from 0.3 kilowatts to 2.0 kilowatts per customer, with load factor approximately 25 per cent.
>
> "Street lighting will require 5 to 12 kilowatts per 1,000 inhabitants and operate with a load factor of 43 per cent.
>
> "Coal mining will require 2.5 to 3 kilowatts hour per ton produced with a load factor of about 25 per cent. Petroleum production, drainage pumping and quarrying will have load factors around 15 per cent, the last named being so low because the operations extend over only six months of the year."

Analyzing the expected use of power in industry, the report says:

"There is a pronounced trend in the industry towards electrification and particularly towards power purchased from central stations. The installed primary horsepower in the four states of the Great Lakes Division has increased from 350,000 horsepower in 1869 to nearly 5,000,000 horsepower in 1919, or an increase from 55 to 307 horsepower per 1,000 of population in 50 years. This compares with the figures in the whole United States showing an increase from about 60 horsepower per 1,000 people in 1869, to 280 horsepower per 1,000 people in 1919, and an indication of over 500 horsepower per 1,000 people in 1950. The installed horsepower in the Great Lakes area in all industries was 2,862,000 in 1920 or 340 horsepower per 1,000 of population. In 1950 it is predicted the latter figure will be 638 horsepower."

As to the total consumption in the area in 1950, the report makes a prediction of not less than 18,000,000,000 kilowatt-hours requiring a generation of about 21,500,000,000 kilowatt-hours. The total coincident demand on generating stations will be approximately 4,600,000 kilowatts. The combined consumption for all uses will amount to about 1,400 kilowatt-hours per capita per annum, and the generation corresponding to this will be approximately 1,650 kilowatt-hours. This compares with 388 kilowatt-hours per capita in the United States in 1920 and 512 kilowatt-hours per capita in 1923.

In discussing the probable location of the future, large generating plants in the area, it is pointed out that this will be determined largely by proximity to water, to fuel and to the market for electricity. The abundance of water for condensing purposes and nearness to the Indiana-Illinois coal fields make the shore line of Lake Michigan the natural site for very large stations and industrial districts at the Wisconsin line and northward will receive their power from Waukegan and Milwaukee, while the Toledo district for similar reasons will be the site of a large station. The area at the south end of Lake Michigan will receive its power from large plants located there.

Commenting on the rapid and steady increase in the adoption of electricity as the power for industries, the committee's forecast continues:

"The power requirements of certain industries, such as mines and quarries, have to be estimated separately. The coal mining industry in the last few years has shown only small growth. We have considered that greater economy in the consumption of fuel will hold this increase to a low figure. For stone quarries, clay pits, and brick manufacturing establishments, a comparatively rapid increase has been assumed on account of the more extended use of masonry for construction purposes.

"Electric railway power, in general, is showing only a small rate of increase, on account of the consolidation of companies into larger systems and improved efficiency of operation. On account of these tendencies we have estimated only a small increase in the requirements for railway power.

"At the present time one railroad in this Area—the territory covered under the survey—is in process of electrification; this is the Chicago terminal division of the Illinois Central Railroad, entering the city from the south, with terminals on the lake front at Roosevelt Road and at Randolph Street.

"This electrification, when completed, will have a power requirement around 162,500,000 kilowatt-hours per annum, with a maximum demand near 46,000 kilowatts. Other terminal electrifications are being studied at the present time, and are likely to be undertaken within a few years.

"Outside of the Chicago terminal district, the largest railroad terminal in the Power Survey teritory, and one which is already heavily loaded, is the terminal at St. Louis. Although a little ways outside the boundary of the Area, it is mentioned here as a likely subject for electrification because electrification at St. Louis as well as Chicago will have a definite effect on the probability of electrifying the four trunk lines between these two places. namely, the Illinois Central, Chicago and Alton, Chicago and Eastern Illinois and Wabash Railroads.

"Another city which has a large amount of railroad traffic with Chicago is Milwaukee, and although the terminal congestion may not be as acute as at St. Louis, there are reasons to believe that electrification of the roads between Chicago and Milwaukee may be expected in the period covered by our estimates.

"Sections of the westbound transcontinental lines have comparatively heavy traffic between Chicago and the Mississippi river and are likely subjects for electrification. The railroads between Chicago and the Atlantic Coast are likely to receive the first attention. There are seven of these roads of considerable importance from the standpoint of transportation. All are likely to make a study of electrification and some will undoubtedly decide to electrify within the next quarter century. A considerable amount of railroad electrification may thus be expected to take place in the Area by 1950, and may be hastened by judicious cooperation within the electrical industry.

"Wide-spread extensions and interconnections of lines are bound to be an aid in the problems of serving agricultural regions; because of the great distances for the lines and the few customers served per mile the present cost of service to farmers is high. This subject is receiving expert attention jointly by the electrical industry and by farmer organizations. Certainly the electrification of rural areas is bound to prosper them.

"The outstanding facts about the electricity supply industry are (1) that it forms the most satisfactory method providing the nation's power requirements and (2) that it best conserves the nation's resources of money and fuel.

"Those directing the industry are everywhere interested in developments which will enable more economical operation and consequently lower selling price of energy. Interconnections and the building up of large systems permit the use of highly economical generating stations of considerable size from which the energy is then transmitted to near and to distant centers and distributed so that all in the areas served may have the benefit of low-cost reliable energy.

"Not only is the fuel consumption per unit of output in steam stations thereby reduced but the amount of the nation's financial resources which must be employed to serve the area is greatly lessened. This follows from a lower investment cost per kilowatt of large stations and from the use of a common reserve for a large area. A double consumption of great importance to the nation, i. e., of fuel and dollars, thus results.

"'Dollars' here refers to the capital resources of the nation which are invested in these large plants through the purchase of materials and labor with which to build them. The conservation of investment is more important in the electricity supply industry than in most other lines of commercial activity, due to the fact that from three to five dollars must be tied up in fixed investments for every one dollar of annual revenues, or sales.

"In other words, the length of time required to 'turn over' the capital is three to five years. Hence the need and advantage of judicious investment of this capital to conserve the capital itself and also the resultant interest charges. The investment once made the fixed charges go on regardless of how much use is made of the investment. Interconnections which take advantage of diversity thus enable a certain investment to be used for longer hours than on a single system and the 'fixed charge' portion of the cost per unit is thus reduced.

"These far-flung transmission and distribution lines bring more water power developments within the realm of the economical than would otherwise be possible. There is unfortunately a good deal of misunderstanding regarding water power development as the popular articles appearing on the subject do not go into the economic phases, but argue from the assumption that all water powers are possible of development to produce low-cost energy. Streams may be divided into several classes for consideration of the economics of development:

"(a) Streams of fairly constant flow throughout the year.

"(b) Streams with a large percentage of the maximum water flow for most of the year.

"(c) Streams that are very erratic, experiencing sudden and short flood periods with intervening periods of little or no water. These are the streams generally classed as 'flashy.'

"The first class forms the basis of the most desirable water power developments and may produce energy at a low price. This class covers a comparatively small number of streams. The second class will produce energy at a higher price because less use can be made of the available water unless expensive storage facilities are provided to maintain a constant flow throughout the year. This class represents a large number of streams.

"The last class is usually uneconomical for development because of the lack of water during a large part of the year and a consequent non-use of the plant equipment. This class includes many of the middle western streams.

"Local conditions such as the flooding of valuable farm land, the necessity of moving structures—such as railway tracks, industrial establishments and many other improvements—may incur costs that will prevent the economical development of the first two classes.

"Because a stream exists, therefore, does not necessarily imply the feasibility of water power development, as building investments may be incurred that will make the cost of energy more than from steam plant sources in the same territory.

"The development of water powers is thus not as simple and usually not as economical as is popularly supposed. It is recog-

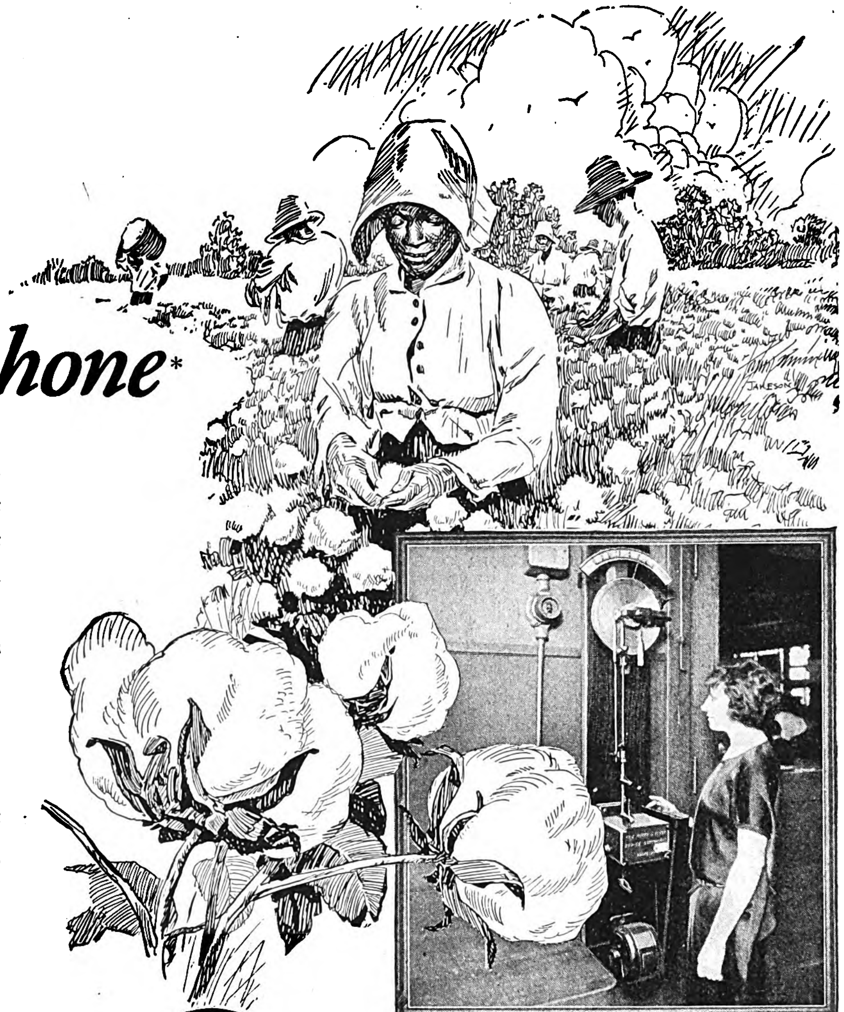
Cotton
–in your telephone*

Cotton is one of nineteen materials needed to make a telephone. The fibre has qualities which play a large part in keeping the voice currents on the pathways provided for them.

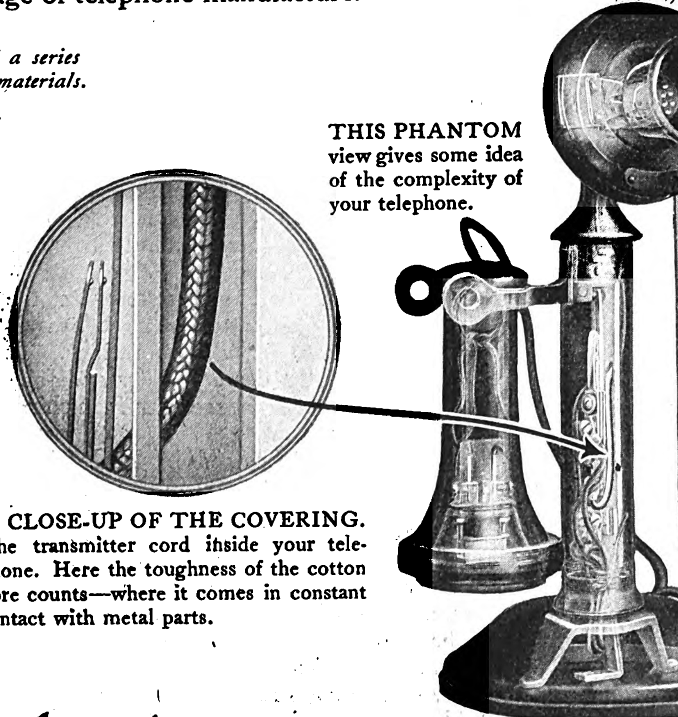
It is valuable as an insulator. It is flexible. It stands usage. Such a combination of properties gives cotton its important place in the covering of telephone and switchboard cords.

This cotton stands the hard test of day by day service because it was carefully selected for the job. Just one more evidence of the high standard which Western Electric sets for every stage of telephone manufacture.

**No. 8 of a series on raw materials.*



THE STRENGTH TEST. This machine takes representative samples of the cotton thread and tests their tensile strength. The standard required is such as to assure long and dependable service.



THIS PHANTOM view gives some idea of the complexity of your telephone.

A CLOSE-UP OF THE COVERING. The transmitter cord inside your telephone. Here the toughness of the cotton fibre counts—where it comes in constant contact with metal parts.

LIKE DANCING AROUND THE MAY-POLE. The spools of cotton whirl 'round and 'round, weaving the cord covering tightly and quickly—so quickly in fact that 11,000,000 cords was the record production for 1923.

Western Electric

SINCE 1869 MAKERS OF ELECTRICAL EQUIPMENT

What Gasoline *do most* Business Men Use?

ASK five, ten or twenty of the business men around you this question, "What gasoline do you use?" Most of them will answer, "Red Crown."

Ask them, "Why?" They will answer, "Because it is the most economical and the most satisfactory." Perhaps some of them have found out just why this is true. If so, they will tell you that Red Crown, because of its instant start, quick pick-up and great power, speeds up their hauling and delivery. They also will tell you that Red Crown gives them greater mileage and reduces costs.

These men are right. Their personal experience proves it. The difference shows up in more satisfactory delivery service and in lower gasoline costs. This is the experience of thousands of conservative business men throughout the middlewest. They prove in actual operation what our technical staff proved long ago in the company's great laboratory.

There are definite reasons why greater power and increased mileage are secured through the use of

RED CROWN
GASOLINE

In simple, non-technical language the reason for the superiority of Red Crown is, that Red Crown is made for the sole purpose of producing power in modern internal combustion engines. Its boiling point fractions are arranged so that they form an even, unbroken chain. This insures sustained power throughout each stroke of the piston and insures also the perfect combustion of every drop of the gasoline.

A test will convince you of the excellence of Red Crown as a motor fuel—the more careful and searching the test, the more convinced you will become of its superiority.

What is Good Gasoline?

The interesting little book we have prepared will answer this question for you. It is well worth the few minutes required to read it. It gives the facts about gasoline and in terms which the average person will understand. It will be sent free on request.

FINANCE

THE JUNE LETTER of the American Exchange National bank of New York will say in part: "Fundamental conditions remain sound, but industrial activity has experienced a distinct decrease. Unemployment is more widespread, the inactivity previously noted in the textile and other trades having spread to the steel and related industries. The building trades continue active, but new plans are being made with greater caution and opinion concerning the outlook for a continuance of operations on the present scale is divided.

"Building permits issued during April were sharply below those for March, although this was partly explained by the heavy volume of permits in New York during March in anticipation of the possible failure of the Legislature to extend the period of tax-exemption for new construction. In several sections of the country the permits issued in April were larger than those issued in March. Those who look for a continuance of present-scale operations in the building industry base their opinions on the fact that many projects for which permits were previously issued have not yet been gotten under way. Shortages of skilled labor in several sections place a limit to the scale of operations in the building industry and tend to increase the uncertainties in the situation, the continuance of full activity obviously being dependent upon willingness of labor to adhere to fair wage scales.

"In part, the decrease in general activity is a result of the operations of the hand-to-mouth policy of buying which has spread practically to all trades. Producers have adopted the policy of producing according to orders, and any moderate falling off in orders is immediately reflected in decreased production. Several industries have been forced into curtailment by natural conditions, and the suspensions in these trades have accentuated the unfavorable aspects of the general situation. As a rule, decrease in productive activities has been followed by increased inquiries on the part of consumers. Forty iron furnaces were blown out during April, the majority of them being blown out after April 20th. This was the greatest number of furnaces to cease operations in a single month since 1921, but increased activity on the part of buyers was reported almost immediately.

"So far, curtailment has not proved effective in the copper industry. That industry has been experiencing a record demand throughout the year, but prices have remained at an unsatisfactory level despite improvement in the statistical position. At the beginning of May stocks had been reduced nearly 100,000,000 pounds as compared with January, and shipments were still running ahead of production.

"The cotton market continues strong, but the wool and silk markets are weak. The cotton market has not been greatly affected by the decrease in mill operations. The wool market is beginning to reflect the decreased demand for clothing. More money is being spent for household furnishings and the like, and less for clothing.

"Fair retail trade, increased bank clearings and other barometers indicate good general conditions, but unless the labor being released by some of the basic industries finds employment elsewhere, a decrease in purchasing power that will find reflection in all trades seems probable.

"The outlook for the crops is generally good and it is reported that this year's wheat crop will be produced at a cost much below that for last year. The condition of the middle-Western farmer is reported as being much improved.

"Every man of good will should understand, and seek to make his neighbor understand, the importance of conserving the national savings for the purpose of bettering and extending the equipment of machinery and tools upon which increased production and wider distribution of the fruits of industry are dependent. There can be no important progress by a nation that takes the bulk of the savings of the country to pay the expenses of Government.

"The public official who has the welfare of the rank and file of the people at heart and who has sufficient understanding of

MEXICAN TREATY

ELIMINARY work has begun on the drafting of a commercial treaty which be submitted to Mexico by the United :s government. Data is being collected overnment departments interested, and ›assador Charles B. Warren at Mexico has held informal conversations on subject with the Mexican foreign office. his step is in line with the general cy of the Coolidge administration to g up to date all existing commercial ties with foreign countries.

hen suggestions of the departments insted, particularly Department of Comce, have been completed they will be mitted to the State Department for inporation in the treaty draft. It is underd the new treaty is likely to contain visions applicable to the oil industry well as the revision of commercial ulations.

Vhile it has been repeatedly intimated administration officials that the doctrine "most favored nation treatment" is the note of American policy in the negoion of the dozen or so of new commerl treaties, and that all those to be negoed will follow generally the provisions the German commercial treaty, there suggestions among representatives of ge business concerns with interests in xico that any new treaty should contain visions of some sort of reciprocity.

It is pointed out that the United States all its commercial treaties makes extion in favor of Cuba, Porto Rico and Philippines, and those who believe nilar exception might well be made with xico cite the fact that American busiss and commercial interests have been ghly satisfied with the Cuban and Philipne arrangement.

The basis of the argument that the ited States should agree with Mexico on me sort of a reciprocal commercial prosal is primarily that of increasing closer lations. It is pointed out that intercourse tween the two countries is constantly ineasing because of the huge amount of merican capital invested in Mexico, not ly in oil and mining industries but in her branches of industrial activity and cause of closer relations between the two untries due to the agricultural developent of the Southwest.

With the bringing of water to the Imerial Valley, the population near the borer, both in the United States and Mexico, rapidly increasing while the number of lexican cittizens who come into the United tates to work has increased until conervative estimates now place this number t approximately a million and a half.

PURE COAL BILL

A pure coal bill has been introduced in ne House by Representative Taber. It nakes it unlawful for any individual, firm r corporation to ship from a point in any tate to a point in another state, to sell, r in any way dispose of fuel, anthracite, r bituminous coal in interstate commerce, that is not 95 per cent pure coal. Sales must be accompanied with a certificate to that effect signed by the miner or producer and also giving the name of the individual, firm or corporation producing and shipping the coal. The name and location of the mine whence shipped is also required. The penalty for violation is a fine not to exceed $1,500, or imprisonment for not more than two years, or both such fine and imprisonment in the discretion of the court.

David, Kraus & Miller

David, Kraus & Miller, Inc., Detroit, will deal in carriage, wagon and other materials. Clara S. Scherer of Gross Point Farms and William S. Cady and Clemons H. Davis of Detroit have incorporated for $500,000.

Will Make Emblems

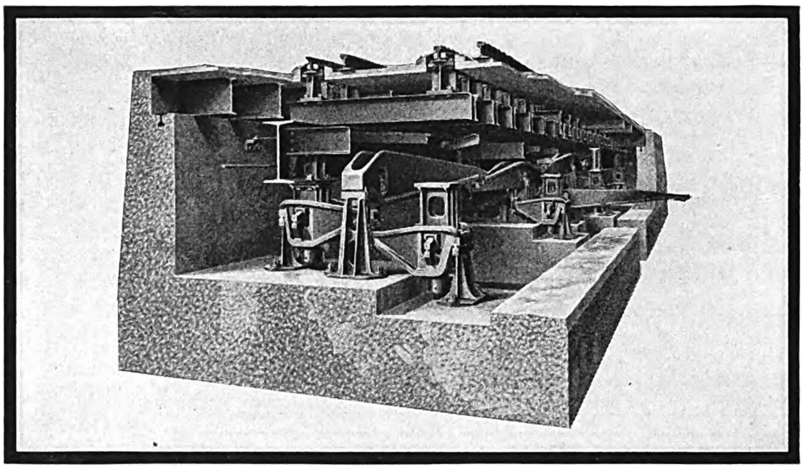
Jewelry, medals, badges, etc., will be manufactured by the Jewell Emblem Manufacturing Company, 1057 W. Fifty-Ninth st., Chicago, incorporated for $25,000 by Peter B. Sorensen, Martha A. Gerbrecht and Ernest H. Gerbrecht.

Vending Machine and Devices

S. F. LaChance, J. T. Johnson and G. C. Corey have incorporated the Butter-Toasted Manufacturing Company, 20 E. Jackson blvd., Chicago, to deal in corn popping and vending machines and devices.

Tenth Chemical Exposition

The Tenth Exposition of Chemical Industries, an international affair, will be held in the Grand Central Palace, New York, September 28 to October 3, 1925.



How Fairbanks Type "S" Railroad Scales have established higher standards of *accuracy and economy*

Fairbanks Type "S" Railroad Scale has made possible higher standards of accuracy because the load is transmitted according to the fundamentally correct principle—*on the center line of the lever*. The load is not *superimposed* upon but is suspended from the pivots of the levers. The levers are all level. Loads do not have to be accurately balanced to avoid twisting strains on the levers.

Another important factor, Type "S" is economical to use. It can be installed at much less expense—adjustments are easily accessible. It wears long and stays accurate with so little attention that "upkeep" is a word you can forget.

Fairbanks Type "S" Track Scales are in use by railroads and industries wherever railroads run. Loadings are easily checked. Claims can be verified. Shortages and losses are prevented.

If it's weighed on a FAIRBANKS, there's no argument

FAIRBANKS, MORSE & CO.
Manufacturers *Chicago*

Limitless

No other word applies adequately to the facilities of this organization to serve manufacturers who use wood in making or shipping their products.

In our Chicago yard of 45 acres are piled thousands upon thousands of feet of all kinds of crating lumber.

Your phone call will start your order towards your factory today.

Just as promptly can we furnish maple, oak and yellow pine flooring, heavy timbers, piling, or any wood you need in the production of your goods, in any size or amount.

In Chicago and suburbs a system of twenty branch yards, ably managed and adequately stocked, means quick deliveries and lower delivery costs.

Phone us, wire us, write us for anything any time. Insure your service to customers by having unlimited service for yourself.

nized by those who have given the subject study that water power plants, especially if on streams with varying flow, are most satisfactory when included in systems containing steam stations to supplement them.

"Popular misconceptions have resulted in some political activity in relation to water power developments and have not furthered the development. It is greatly in the best interests of the public to have all cases frankly discussed so that facts may be more generally known.

"Fortunately for the power user in this area no unwise state policy has actually been adopted to hinder the orderly and economical development of hydro-power.

"There is as yet no apparent understanding of the harmful effect on water power development and power users that unwise legislation, if enacted in the future, may inflict. The development of water power, while necessary as a conserver of natural resources requires a larger expenditure of capital and is attended with more risk than the erection of a like sized stream power plant. For these reasons the builders of water power plants should be protected in their rights of use and length of franchise by measures similar to the Federal Water Power Act.

"Another subject not fully understood by the layman is that of locating steam power stations at the coal mines. Judging by many articles appearing in the popular press, there is a widespread belief that all power stations of the future will be located at the mouth of mines.

"While this is a desirable place for power stations, when other factors are favorable, it seldom occurs in this part of the country that all conditions can be satisfactorily met by such locations.

"In the first place, the location of steam power plants has one factor in common with water power, namely, the cost and reliability of transmitting the energy to its market. In addition to this and of paramount importance is the necessary supply of water required for condensing purposes, without which the production efficiency cannot be high.

"In any economical process of transforming steam into electrical energy, it is absolutely necessary that the steam be condensed into water after it leaves the turbine. The only known suitable medium for condensing this steam is an abundant supply of cool water.

"Studies made by the government during the world war showed a great advantage of transferring power from one manufacturing district to another in time of stress. Usually such interconnections have to be made rapidly using a minimum amount of equipment. The only way that speedy interchange of power can be affected is to have the requisite plans made during the times of peace, and the neighboring systems prepare for interconnection by the addition of transmission lines built with standard parts. This can be done speedily as occasion demands without the necessity of waiting for transforming or frequency changing equipment to be manufactured.

"In determining the probable best development, many factors have to be taken into consideration, such as location of fuel and of water for condensing water powers possible of economic development, probable population changes, industrial developments, railroad electrification, use of electricity in agricultural and location of future industrial centers. It is largely a study for the economist. The engineering problems involved, while not simple by any means, are being successfully met. The problems are of great importance, but those of policy are at the moment of greater importance."

"The location and relative importance of the industrial districts and comparative demand for energy in other portions of the area can be judged because of the natural advantage in water and transportation of the region and particularly with the possibility of a Great Lakes-St. Lawrence route to the Ocean. It will be the densest industrial section if the Lakes-to-Gulf waterway has progressed sufficiently, the Illinois River will have more and larger industries along its banks. It is expected that practically all present industrial centers will show considerable growth especially those that are favored with good transportation and water and fuel but electrical distribution systems will be factors in prospering other locations."

NO WAR WITH JAPAN

Continued from Page 6

t a copy of these conclusions and resolutions be forwarded to ent Coolidge, Governor-General Wood and the American Press.

trip, which took five months, was partly on business and y for pleasure. I established offices in every one of the sixteen ries I visited so you see I was not loafing much of the time. ricity is so cheap in Japan that they have it in every house hey burn the lights all night long.

Java they use elephant power for industrial purposes. I part in an elephant drive where they rounded up forty-two ants. There was a terrific fight between Old Billy, a tame ant who acted as decoy, and a wild elephant. Old Billy final- lled his antagonist by goring him with his tusks, piercing his hide and heart, going through two feet of flesh, bone and v. The mahout who was driving the trusty elephant, escaped liding over his tail. I brought back the two hind legs of the elephant and am using one of them as a wastepaper basket. elephants, after they have been broken into harness, are used road building, log piling and various power purposes. There t be at least 10,000 wild elephants in Ceylon.

MERICA SECOND TO BRITAIN IN NAVAL STRENGTH

HE American fleet is given a second place in fighting strength as compared with those of Great Britain and Japan in an lysis submitted to the house naval committee by Secretary bur.

nstead of the 5-5-3 ratio fixed by the Washington arms confer- e, he said the present ratio, not considering "strategically lo- d and well-equipped naval bases," is 5-4-3, with the sea forces Great Britain, the United States and Japan ranking in the order ned.

he report, made in response to a resolution of inquiry by Rep- entative Britten of Illinois, ranking republican on the commit- , sets forth a number of recommendations for congressional ion looking to the strengthening of the navy through moderni- ion and new construction. It also shows the United States st active among the three nations in most branches of permitted nstruction now in progress, although in the case of destroyers s government is building none, because it ranks first with re- ect to such vessels.

Much of Secretary Wilbur's report was a verbatim reiteration observations made recently by Assistant Secretary Roosevelt in etter to Chairman Butler of the committee commenting on state- nts of W. B. Shearer, a naval expert, that the actual ratio is 3-1, with America 1.

Mr. Wilbur, as did the assistant secretary, pointed out that the 4-3 estimate "does not take into consideration strategically lo- ted and well equipped naval bases which add greatly to the sea wer of a nation, nor does it take into consideration the relative ength of the various merchant marines."

Expect Turn for Better in Steel

Steel executives in New York to attend the meeting of American Iron & eel Institute this week all expressed the opinion that the industry was agging on bottom.

President Grace said the Bethlehem Steel corporation was operating ound 50 per cent. He saw slight signs of betterment. "We have touched ottom," he said. Had the senate sustained the president's veto of the bonus ll, he believed there would have been an immediate upturn in business.

President Campbell of the Youngstown Sheet & Tube also said his company was operating at about 50 per cent. Situation, he said, is about as w as it can get, and business is bound to be better. He expects an improvement after the political conventions and adjournment of congress.

Regarding the Youngstown Sheet & Tube dividend recently declared Mr. ampbell said the dividend had been earned in the first quarter and that in fteen months the company had piled up a $12,500,000 surplus. "Why houldn't we have paid our dividend?" he asked.

Vice-President King of Jones & Laughlin Steel said that company was perating about 65 per cent. "Things are not as bad as made out in some uarters," he said. He does not look for an immediate improvement in usiness.

February 12 and November 11 legal holidays, the Legislature wisely determined that Massachusetts is well-supplied now.

Despite the fact that last year's (1923) legislature established a special commission on old age pensions to report in 1925, there were filed several petitions of this sort, among them that sponsored by the Fraternal Order of Eagles. They were all referred to the next Legislature.

While the operation of motor vehicles has created a new field for legislative action, and many petitions of this class were filed, that of principal interest is a bill to compel liability insurance. Such a measure has been reported favorably by the Committee on Judiciary and is now being considered by the Committee on Ways and Means. It is probable that some sort of remedial legislation will be enacted.

There is a bill now before the Committee on Banks and Banking which would prohibit the sale of securities on the partial payment plan. The bill, as drawn, would prohibit the sale of stock by corporations to employees on the installment plan. It is believed the bill will be amended to eliminate this prohibition, yet the bill as drawn is quite in line with the expressed opposition of certain labor leaders who appear to see only an ulterior motive in the sale of such stock to employees.

Two measures, sponsored by the Massachusetts Branch, A. F. of L., were given "leave to withdraw." These were for a legislative amendment to the constitution regulating the status of labor unions and their members and exempting them from amenability to certain law—the anti-injunction bill, so called—and to provide for an amendment striking from the state constitution the requirement that assessments, rates and taxes shall be proportional.

Similar disposition was made of another bill from the same source which would have given control of free and private employment offices to the Department of Labor and Industry.

Mayor Curley of Boston, the probable democratic nominee for governor this Fall, sought to increase the rate of taxation upon intangibles from 6 to 10 per cent and the excise tax on domestic business corporations from $5 to $10 per thousand. The legislature did not agree with him.

A bill has been reported which would subject to local taxation machinery used in the conduct of business (but not to include stock in trade). This measure has the approval of two committees and will probably pass. Another bill, which has passed the house and is now in the Senate, would make liable for purposes of taxation, the one in possession of consigned goods on April 1, of each year.

Since the adoption of the budget system, the state's financial condition has improved In 1921, the net direct state debt was $35,128,000. At the beginning of this calendar year, it was $20,792,000, a reduction of $14,336,000 in three years. In the same period the state tax has been reduced from $14,000,000 to $12,000,000. This year's budget makes provision for further reduction of the state debt.

NEW JERSEY

A total of 864 bills and resolution were introduced during the 1924 session of the New Jersey Legislature, of which 270 were finally enacted and approved. Among the measures of interest to industry which were enacted were the following:

Workmen's Compensation Insurance.

(a) Increasing from $200 to $500 as the fine for first offense and fixing a fine of $500 and imprisonment for 30 days for any person or corporation which fails to insure employees under the law; and also making a general contractor liable to employees for injuries received while working for a sub-contractor, if the sub-contractor does not carry compensation insurance.

(b) Making nine occupational diseases compensable under the workmen's compensation law; including: arsenic poisoning; anthrax; lead poisoning; mercury poisoning; benzine, and its homologues and all derivatives thereof; wood alcohol poisoning; chrome poisoning and caisson disease.

(c) Providing for double benefits under the compensation law to all illegally employed minors when injured, that is, for children between the ages of 14 and 16 years.

Credit Unions for Employees.

A law providing for incorporation of Credit Unions to encourage savings in industrial plants by association of workmen, and to make loans from such association.

Among the measures defeated were:

(a) Three bills to permit so-called "peaceful picketing."

(b) An anti-injunction bill.

(c) A bill to include canneries in the No Night Work For Women Law, which becomes effective at the end of 1924.

(d) A bill to enable workmen to procure expert medical testimony in accident cases, not provided in the compensation law.

(e) A bill to reduce the waiting period from 10 days to 7 days, during which an injured employee receives no compensation payments.

RHODE ISLAND

A prolonged minority filibuster in the Senate which has been in progress since the opening day of the 1924 session was still under way on May 7th, with the result that up to that date not a single measure had been passed by both houses of the Rhode Island Legislature. The total number of bills introduced was 823.

(7) 48 hour bills for women and children were introduced, one of which had passed the House of Representatives by a large majority and at last report was in the hands of the Senate Committee on Judiciary.

A bill is pending providing that no minor under 16 years of age shall be employed, etc., in any factory or business establishment between the hours of 8 P.M. and 6

. and also provides that where any l of 14 or less who is unable to read write legibly simple sentences in the lish language or has been examined by erintendents of Schools and found men- incapable of making further progress, loyment certificates may be issued per- ing the child to go to work.

nother bill relating to minors under age of 16, prohibits their employment more than 48 hours a week or more 1 8 hours a day.

ne of the most important bills intro- ed seeks to reduce the legal work week day for men from 60 to 54, with a max- m of 10 hours labor in any 24 hour iod.

far-reaching amendatory Workmen's npensation insurance proposal was in- luced which would—

(a) Increase the basis of payments rom 50 per cent to 66⅔ per cent;

(b) In case of death from injury in- rease the maximum from ten to fifteen lollars, the minimum from four to seven lollars. When totally incapacitated from vork, increase from sixteen to eighteen lollars maximum, from seven to nine lollars, minimum for five hundred weeks. The present law is, for five hundred weeks, no more than five thousand dol- lars.

(c) In specific injuries the maximum is raised from ten to twelve and from four to five, increasing the period from one hundred to one hundred and fifty weeks.

(d) The act also provides for occupational diseases, specifying nineteen different diseases, which come under the act.

Other miscellaneous bills introduced ich are of interest to Rhode Island in- stries are:

(a) One day of rest in seven.

(b) Providing for old age pensions.

(c) Prohibiting employment (Knowing-) of females within four weeks before or ter confinement.

(d) Equalizing wages of female school achers with those paid to men.

(e) Prohibiting discrimination in pri- te employment against members of the gislatures.

(NOTE: Organized labor alleges em- loyers discharged labor union members mployed in their plants who were elected serve in the legislature.)

(f) Granting to women equal rights, rivileges and immunities now possessed y men.

IRGINIA

Somewhere between 1,150 to 1,200 bills vere offered for consideration in the 1924 ession of the Virginia Legislature, out of vhich there resulted 483 enactments.

A compensation insurance measure was ntroduced which would have added from 5 to 60 per cent, about ($1,000,000) in dditional insurance costs if it had passed in its original form. After a long sus- tained effort by the organized manufac- uring interests the bill was finally passed in such form that the only increases involved were in the weekly minimum benefit from $5 to $6; a disfigurement clause, a loss of hearing clause, and the administrative fund from 3 per cent to 3½ per cent. The net result was an increase in costs of not more than 2 per cent.

A resolution was adopted providing for a Commission to study the question of state administered "Old Age Pensions." No opposition to its passage was offered because it carried neither an appropriation nor any definite authority.

One other measure passed was a very much amended and unobjectionable taxation bill.

Several bills of vital interest to Virginia industries were successfully defeated, including the following:

(a) A "sawdust" stream pollution bill.

(b) Giving unlimited control over safety appliances to the Commissioner of Labor.

(c) Eight-hour day for women.

(d) Imposing a tax on candy.

(e) Imposing a tax on machinery.

(f) A drastic "fire escape" bill.

(g) An objectionable bill providing for the labelling of caustic acids and alkalies.

Thrown Silk Rules Ready

The Thrown Silk Rules which were officially approved by the Board of Managers of the Silk Association of America on March 19, are ready for distribution, it was announced at the offices of the Silk Association of America, yesterday. This is the first edition of standard rules to govern transactions in thrown silks. In addition to the rules a form of contract is provided consisting of a memorandum of purchase.

Traffic Safety Conference

Frank Page, commissioner of highways of North Carolina and "father of good roads" in that state has accepted the invitation of Secretary of Commerce Hoover to be chairman of a committee on highway construction and engineering in its relation to safety in traffic. The appointment has been announced by Col. A. B. Barber, who has been asked by Secretary Hoover to serve as director of a joint organization of a number of national organizations seeking to improve the present traffic conditions. The committee headed by Mr. Page is one of seven, headed by men of national prominence in their respective fields, to undertake preliminary work in preparation for a general conference on street and highway safety which will be held later in the year, and in which national organizations promoting safety will take part. The seven committees will undertake studies in the following subjects: Statistics as to traffic accidents; control of traffic in urban and rural districts; licensing of drivers; city planning and zoning in relation to traffic congestion and safety construction and engineering as a factor in safety improvement; insurance and its effect on traffic hazards; motor vehicles, their equipment and size and weight as safety factors; and the development of a safety educational program.

Domestic Exports, Principal Grains

Exports of all grains during April, 1924, showed substantial reductions under the April, 1923, shipments. Flour exports showed some decline for April, but an increase for the ten months ending April, which is rather remarkable considering the very large decline in grain shipments. The total value of the grain and flour exports for the ten months ending April, 1924, was $215,473,182 compared with $397,421,032 for the same period ending April, 1923.

Why not a profit— instead of a loss on your rags?

Forty-nine tons of rags saved in a single year was the record made by one big printing plant with its Troy Rags and Waste Reclaiming System.

How many *Tons* of rags ($) a year are you burning each year?

Our equipment will enable you to *re-use your rags* many times—thereby showing you a *profit* where a loss now exists.

Are you burning your rags, simply because they are grimy, dirty, or oil soaked, when we can show you a far better and more profitable disposition of them by our Reclaiming System?

CUSHING OPPOSES HOOVER'S COAL STORAGE PLAN

George H. Cushing, spokesman for the nation's coal operators, in the May 15 issue of *Cushing's Survey*, says of Secretary of Commerce Hoover's recent statement that "there is every transportation and financial reason for storing coal during the next few months in preparation for the autumn need."—

The Honorable Herbert Hoover—he is our Secretary of Commerce, if you remember—has just recommended that the people begin at once to accumulate additional stocks of coal. He says this is necessary if we wish to avoid a car shortage next fall and winter. After consulting some authority beyond the reach of coal men or mortals, he says there is danger of a coal shortage this fall.

His specific recommendations have been broadcast to all trade associations. He makes the suggestion that the association secretaries broadcast it to their members. That has some punch because the Department of Commerce recently compiled a book on trade association activities. Therefore, it has a complete list of all such organizations. Mr. Hoover's appeal went to that list. Assumptively, every business man in the country will soon know what is proposed. In addition, Mr. Hoover took advantage of an interesting situation in all newspaper offices. That is all places of business and all public offices are closed on Sunday. Being idle, they create no news. Therefore, the newspapers on Monday morning have little to print except sermons, accidents, and crimes. When the newspapers were hungry for live "copy," Mr. Hoover gave them a prophecy of a coal famine to fill in the yawning holes in their news columns. That was very adroit.

So all business men and householders have, by now, been told that a coal shortage—due to a car shortage—will come unless there is additional storage now.

Mr. Hoover then uses his scream of alarm to preach his regulation sermons —I mean stereotyped. He says that the coal business needs stabilization; therefore the peaks must be planed off, as he expresses it, so the valleys can be filled up. This, being interpreted, means that the periods of big demand must be moved forward four or five months to fill the market holes when there is little demand. He calls this stabilizing the business. He means regulating the habits and needs of users—but it is not our function to correct a cabinet member's English.

But, concerning stabilization: While out in the country Sunday afternoon, we saw a horse which had been completely stabilized. It had been struck by lightning in a storm of the preceding night. It lay exactly as it had fallen—one foot pointing toward the great dipper and another toward the north star. All application of force failed to change that pose. Its feet continued to point in the same direction. The animal was completely stabilized—even though quite dead.

The Honorable Mr. Hoover is ambitious to stabilize completely the coal industry. In doing so, he may kill it, to be sure; regardless of consequences, he *will* stabilize it. Therefore, he wants the people to increase their storage at a time when the industry is being ruined financially by the presence of too much storage. Of course the onrushing insolvency of coal is dragging the country down into a period of depression. And, a depression will repudiate the Republican Administration. But, ho hum! What's the difference? Coal must be stabilized. Mr. Hoover has said it.

Nothing saves this proposal—based as it is upon the assumption of a coming coal shortage—from being ridiculously funny, except the possible serious consequences of this amazing campaign. That is, Mr. Hoover, personally, last December, asked the miners not to indulge in a strike this spring. He allowed them to understand that if they would not strike, they should have the same wages they had been getting—spread out over a long period, three, four, or five years. He arranged for them a nice little scheme by which they might procure the support of certain powerful news agencies. Knowing of these various conferences, understandings and arrangements, the operators renewed the wage scale. They signed on the dotted line because they did not dare fight a combination of the Miners' Union, the leaders among the press, and a fraction of the government, even if the result should be to bring down the cost of coal to the consumer. At any rate, the agreement was signed and the wage scale is fixed for three years. It cannot be broken without great trouble. The only thing that the operators can do is to collect money enough from the public to pay the bill. If the public is to be coerced—the word "coerced" is used with full consciousness of its force —into paying enough for coal to pay the wages of the miners, then the operators must have, at the time, some little advantage over the public. There must be occasionally a seller's market instead of perpetual buyer's market. Under no other conditions can the money needed to pay the miners be collected. Excess stocks of coal create a perpetual buyer's market.

Having perfected the arrangement by which the miners *are promised* an artificial wage, Mr. Hoover is now proposing to add to *excess* stock piles, already enormous, *additional excess stocks*. Present stocks create a perpetual buyer's market. To increase stocks will yield "*no market*" conditions. Prices from being merely "soft" will go to hell.

Putting this thing bluntly, because the situation demands plain speaking, Mr. Hoover created an artificial wage situation which yields an artificial high cost situation. Having thus jacked up costs, he is now proposing to create a technical market situation in which those artificial costs cannot possibly be recovered. Indeed, if prices continue to decline, the operators have nothing to do but to try to break the Hoover wage settlement and to force a reduction on the miners. Therefore, if Mr. Hoover insists on his storage program, he is going to force a repudiation of his agreement with the Miners' Union.

EXPECTS GOOD BUSINESS

C. H. Markham, president of the Illinois Central Railroad, expressed a feeling of optimism as to the future of general business as well as the business of his road.

Realization, he declared, of present prospect of good crops, and acceptance of the Dawes plan, combined with the passing of the fall election uncertainties, ought to bring about a condition favorable to improve business in the latter part of the year.

"Last autumn," he said, "we made heavy outlays on our property and got it into first-class condition. As a result when traffic receded somewhat this year we were able to continue making a satisfactory net showing without the least impairment of the quality of the service or the safety of the public and employes."

QUALITY, PREPARATION
AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

Motor Car Exports

xports from the United States to Yugoslavia 1923 were 6 passenger cars and 1 truck. Pros- ts for the sales of American automobiles in thern Yugoslavia are moderately good, al- ugh the market will be limited for many years. proximately 85 per cent of the population are sants, whose purchasing power and standards iving are low. In 1923, there were 922 licensed omobiles in the province of Slovenia; between 4 and 1923 there were 1,057 in the province Croatia-Slavonia. Automobiles cannot be sold e from catalogs, or by inexperienced agents, prospective customer demanding careful ob- vation of the car he is buying. Personal in- tigation of the market should precede any s activity.

xports from the United States to Latvia in 3 were 90 passenger cars and 37 trucks; to huania, 9 passenger cars and no trucks; and Esthonia, 122 passenger cars and 83 trucks. Baltic States represent a limited but growing d for American passenger cars, trucks and torcycles, all of which may be expected to elop the market as rapidly as possible. Latvia, huania and Esthonia have about 400 passenger s each, with American cars representing about per cent of the total and old war stocks of rman manufacture the greater part of the ance. Latvia has about 150 trucks, Esthonia and Lithuania 50, with the same national ferences. American motorcycles are very pop- r and virtually control the market, about 170 ng registered in Esthonia, 150 in Latvia and 30 Lithuania. Accessories of American manufac- e find favor but European products dominate gely because the market is limited and has not warranted extensive sales efforts. Imports of erican automotive products have been showing siderable development since 1922, notwith- nding that the motor car trade has been re- icted to a luxury basis in these countries, and so restricted at the present time. Improvement the economic condition of these territories, it believed, will cause road development and in- ased demand for improved automobile transpor- ion facilities both for commerce and pleasure.

Power Projects Possible

Nineteen power projects are possible on Arkan- River in Colorado, according to a report pre- red by an engineer of the Department of the erior, Geological Survey. These projects will present a total potential power of 44,000 horse- wer for 50 per cent of the time and 24,000 rsepower for 90 per cent of the time. The use the water for power, however, is secondary its use for irrigation. Six reservoir sites were und, but owing to the high cost of construction ly two are considered feasible at present. One these sites is on East Fork of Arkansas River ar Leadville, where a dam 100 feet high would eate a reservoir having a capacity of 10,000 re-feet; the other site is at Twin Lakes, where 75-foot dam would create a reservoir having a pacity of 130,000 acre-feet. The Twin Lakes ervoir could supply water for both power and igation. Between Leadville and Buena Vista re are three good power sites. Between Buena sta and Salida there are four power sites. A m is already built at one of these sites. Be- een Salida and Pleasanton there are three pow- sites, and between Pleasanton and Canon City re are four.

Electrical Corporation Formed

Louis C. Mathews, 268 E. Euclid Av., Detroit; anley A. Kuhlman, 6627 Stuart St., and Emil idich, 1296 Pennsylvania Ave., have formed the hat's It" Products Company, incorporated for 3,000, to build and install electric and chemical uipment.

New Washing Machine Company

The Sommers Brothers Appliance Company has en incorporated for $200,000 by Frank F. mmers, 900 N. Michigan Av., Saginaw, Mich; lvester A. Sommers, 315 Cedar St., and Charles Smith, 6 Jefferson Court. It will deal in shing machines.

WILLIAM HAMMERSCHMIDT

William Hammerschmidt, a pioneer resident of DuPage County, who died last week, was for many years a member of the Illinois Manufacturers' Association. He was born in Naperville in 1854. He was president of the Lombard State Bank and a director of other banks, stone quarries and other enterprises in DuPage County. For 32 years he served as supervisor of York township and for 24 years was president of the Lombard State School Board.

Motor Driven Railway Cars

Smaller cities of the country, situated on branch railroad lines and now suffering from retarded development because of unsatisfactory transportation, will soon have better railroad service and a chance to capture their share of the nation's business, declared Carleton B. Hutchings, secretary of the National Transportation Institute, in an address before the Chamber of Commerce of South Haven, Michigan. Motor driven railway cars are enabling fast and adequate service on branch lines, he said. Efficient branch line transportation enables smaller cities to hold their manufacturing and shipping business and build them up.

Leviathan Sailings

The SS. Leviathan, pride of the American Merchant Marine, will sail from New York for Cherbourg and Southampton on June 14, arriving June 20. She will sail from Cherbourg and Southampton on June 24, arriving in New York on June 30.

General Motors Meeting

A special meeting of stockholders of General Motors Corporation will be held June 16 to take action upon resolution adopted by the directors for reorganization of capitalization. The plan contemplates a new issue of no par value common stock in exchange for present common shares on basis of one share of new for four shares on present common. Consolidation of present issues of senior securities into one issue on 7 per cent preferred stock. The holder of present 6 per cent debenture and 6 per cent preferred stock will be given the right to exchange their stock for the new 7 per cent preferred, share for share on payment of $10 cash.

White Busses to Yellowstone

When Yellowstone Park opens for the season on June 20, there will be available for tourist travel through the big national playground 60 new White 11-passenger busses. The busses have been shipped from the White factory in Cleveland in one trainload, said to be the largest shipment of busses ever made. With the new equipment the Yellowstone Park bus fleet will number 279 Whites, being the second largest in the United States.

Plumbing Fixtures

William, Clara and A. Phoebe Powell have organized the Powell Brass Company (Grand Rapids, Mich.), to manufacture and deal in plumbing fixtures.

THE TEACHER

Continued from Page 13

agement difficulties, the group meeting begins to lack sincerity and the students lose interest.

Where leaders are not selected by the management the group select their own leaders from among other executives, or elect one of their number to that capacity. A new development is for the group to elect by secret ballot some foreman to act as group leader. This leader is then instructed on his duties, the employment manager entrusts him with the solemn duty of carrying out the program faithfully. He is usually a clever fellow who plays no favorites and is keen on lining up his men for "action." He is a good fellow, a born cheer leader. He usually has before him an outline of the discussions for the period. One topic at a time is taken up, and the men discuss it in the light of their experience in the plant.

Where the employment manager, superintendent or other factory executive supervises the group conference he takes care not to run the discussions. On the other hand, he remains in the background, preferring to give the men full play. Very often he precedes the conference with a brief talk, which never lasts more than fifteen minutes, or at most a half hour.

THE HUMAN ELEMENT

Continued from Page 12

used there in an entirely different connection, admirably fits what I am trying to tell you. This expression said: *"There can be no mutuality of action unless someone begins. The obligation to begin is always upon the stronger."*

Finally, let me voice as a purely personal conviction the belief that there is something more on the employer's side in this whole idea of a better and happier industrial relation than successful production, than even the safeguarding of our form of government, with all its cherished institutions. There is, I believe, something in it beyond and above any mere material consideration, however great or necessary that may be. Power and strength bring opportunity, and opportunity brings an added obligation that neither seeks nor expects any reward—the obligation of altruistic purpose and altruistic endeavor, an obligation unselfishly to do what good we can, each in his own time and place and way.

I am glad personally to believe the altruistic obligation of each of us toward his fellow man—and especially of those with the power and the means to discharge the obligation—was laid upon us from long ago, on an evening in a garden not far from Calvary, when He who had come to be the Light of the World and was about to depart said to the faithful ones about Him:

"He among you who would be greatest, let him be the servant of all."

FINANCE

Continued from Page 18

the economy of the nation to qualify him for the position he holds, conserves the national interest by using his influence against excessive expenditures and in favor of forms of taxation that will take as little as possible of the funds that are most likely to go into additions to the productive machinery of the country.

"Since 1900 the per capita production of goods in this country has increased 60 per cent. Every man, woman, and child in the United States has had that much in all kinds of things, clothing, housing, amusement, automobiles, added to his or her share of the national product since the year 1900. This result was made possible by the fact that for many years before 1900, and from that year on, the earnings of corporations and the excess incomes of individuals of large wealth were being turned back into plant and equipment so that production might be increased. Everybody who saved a dollar contributed to this rapid advance in the material welfare of the country, but it is obvious that those who received most were able to save most. There is a physical limit to the amount of money any man can spend in catering to his selfish pleasures, and when that limit is reached the most selfish man in the world automatically becomes a saver and a benefactor of society, for the money he is forced to save will lay just as much railway track, build just as much of a power plant, as an equal amount saved in any other way."

Meeting the Banking Requirements of Modern Business

With a clientele embracing every line of business and a board of directors composed of leaders in every branch of commerce and industry, the Illinois Merchants Banks have an unusually intimate contact with modern American business.

The officers of these banks consequently have a wide experience and are peculiarly fitted to give effective and intelligent attention to the needs of their commercial customers.

DeSoto discovering the Mississippi River where Memphis now stands, 1541

HERNANDO DE SOTO—adventurous spirit of a bygone age—discoverer of the mighty Mississippi! True it may be that his great find was but a "by-product" of the eternal quest for gold, yet like the "hand that rounded St. Peter's dome," he builded better than he knew.

In recent years, no part of the South has seen a more spectacular development than that section of which the city of Memphis is the center. We consider it a great privilege to have a part in the upbuilding of such a great, progressive country.

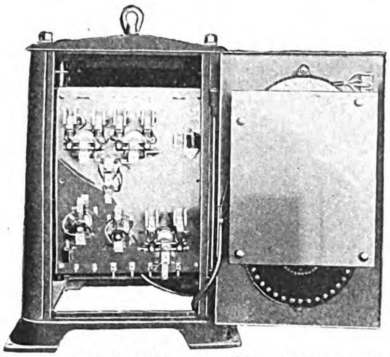
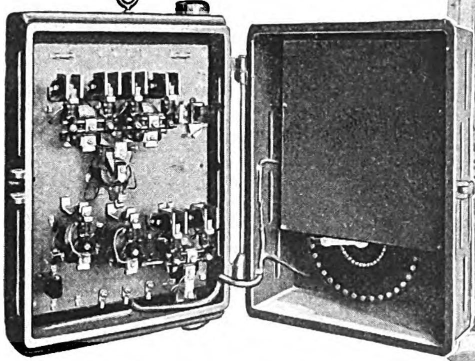
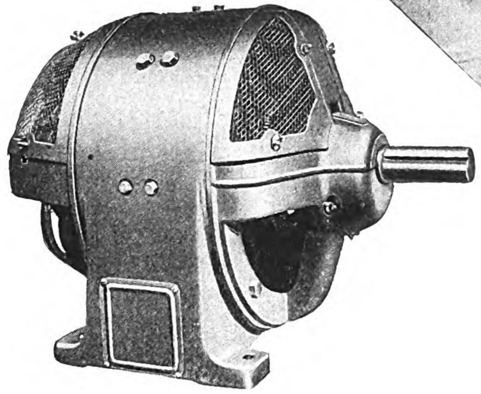
For Planers



G-E Planer Controllers provide positive under-voltage and overload protection. Types for floor mounting (above)—and wall mounting (below).





G-E Type RF Direct-current Reversing Motor drive—the most highly developed drive for large planers. **Over 2000 are in this service.**

Dynamic Braking

with Reversing Motor equipment has these advantages

—Positive slow speed and definite stop for setting up work, without extra equipment.

—Requires less control apparatus, which lowers maintenance cost.

—Simple to operate. To bring planer to rest, throw master-switch to off-position and platen stops within definite over-travel.

—Accurate stopping, for operating current is independent of line current.

—Dynamic Braking prevents platen running off bed should line contactor remain closed from any cause.

Ask the nearest G-E Sales office for complete information on this equipment. It has many advantages over the plugging method.

When the *complete* electric equipment is built by *one* manufacturer—you get service that satisfies.

ILLINOIS WATERWAY DELAYS

W. L. Sackett Points Out What State Has Done Despite Many Obstacles

WHO is to blame because Illinois has no waterway after waiting two hundred and fifty-one years?

As a result the entire Great Lakes to the Gulf Waterway has been held up. Eighteen states either in the Mississippi Valley or contiguous territory are ing the advantage of cheaper transportation.

The Illinois Division of Waterways is not responsible for the ay says W. L. Sackett, Superintendent. Mr. Sackett in a letter the Illinois Manufacturers' Association points out that in 1923 lock of the five to be constructed on the Illinois waterway s completed, that construction on another lock at Lockport is ll under way and that construction of a third lock at Starved ck in LaSalle County has been held up on account of a law- t brought by opponents of the waterway in LaSalle County.

"LaSalle County Court decided against the state," writes Mr. ckett, "which made desirable an appeal to the State Supreme urt where the case has been pending since June, 1923, and s is the only reason why three-fifths of the work is not under ntract instead of two-fifths."

He calls attention to considerable activity in the work on the inois waterway during the last three and a half years.

Mr. Sackett's explanation was called forth by a folder prepared the Illinois Manufacturers' Association, giving a chronological cord of attempts made to secure a waterway for Illinois beginng in 1673. In that year, Louis Joliet and Father Marquette, ter traveling in birch bark canoes from the future site of Chicago wn the Desplaines and the Illinois River and thence down the ississippi, recommended to France a waterway connecting Lake ichigan with the Mississippi River.

Mr. Sackett admits that many of the statements in the circular titled "When Will We Get Our Illinois Waterway?" are true but insists that it does not go far enough and does not give credit where credit is due. Some of the reasons for the delay, and what has been accomplished in the face of obstacles, are pointed out by him, as follows:

Between 1908 and 1915 it was impossible to compose differences and get members of the General Assembly to authorize the construction of the waterway. Upon the act of 1915 becoming a law, application was made at Washington for approval of the plans as required by the Federal law, but this approval was denied, which resulted in four years more delay.

In 1918 the Division of Waterways found out what the trouble was in Washington and reached an agreement that the government would approve the plans if another act was passed in 1919. This act provides for the construction, operation and maintenance of a deep waterway from the power plant of the Sanitary District at Lockport to a point in the Illinois River near Utica and the development of waterpower.

Upon this 1919 act becoming effective, plans for approval of the Chief of Engineers of the Federal Government were submitted and approved.

In 1920 the Division of Waterways developed plans so that a contract was let for the first lock.

In April, 1923, at a saving of $110,000 over the bid price, one lock of the five to be constructed was completed at Marseilles. Contract for another lock at Lockport was let in October, 1923, and construction on it is well along.

In January, 1923, bids were advertised for a third lock at Starved Rock in LaSalle County, and favorable bids were received, when the work was tied up by legal objections by opponents of the waterway.

"At every point where the State of Illinois desires or acquires

THE STUDENT

Seventh Article on Training Factory Foremen

By J. K. NOVINS

All Rights Reserved

AS foreman-training often proves of some expense in time and money to the management care must be taken to pick candidates who will benefit most from the instruction. Where the students are assigned to definite groups it must be ascertained in advance whether they properly belong to the respective groups. Misplacing a student in the wrong group may retard the progress of both the student and the entire group. And then, there must be some sort of rating scheme to indicate the individual student's progress. In the standardized course of study the student is rated on his response to discussion and his ability to solve definite problems assigned to him by the instructor or leader. In case of outside institutions, the ratings may be sent direct to the plant management. But how rate the foreman's improved efficiency in the department as a direct result of the instruction?

In many plants there is no such system of individual rating, the success of the course being determined largely by the total efficiency of all the foremen-students as shown by increased production and improvement in management of men and machines. Some sort of individual rating, no matter how crude, will check up on the ratings received by the student in class.

However, under the group study plan, especially where the instruction is purely voluntary and the men choose their own leader, individual ratings are not part of the educational program, and the sole basis for judging increased efficiency rests on comparisons of the efficiency ratings received by the men before and after the instruction.

For instance, in one plant, where a systematic course of instruction of minor executives was in progress, each student, in addition to ratings for performance during class study, was given a mental examination. In rating the student the supervisor not only took into consideration the man's mental capacity and class work, but the number of errors and complaints arising from the work under supervision. By averaging these ratings the supervisor determined whether the student's record was fair, good or poor. If the student received a still lower rating he was either eliminated from the organization or transferred to a less responsible position. Poor students were given special assistance for a period of time, and if they showed no improvement, they were either eliminated or transferred.

This scheme will not apply in the average plant. The average foreman will resent a system of instruction involved in red tape and elementary school discipline. He regards himself on a higher plane than the apprentice and operator who are constantly, and justly, rated on performance. On the other hand he will not object to some sort of rating whereby he can learn to his own satisfaction, as well as that of the management, that he is making definite progress as the direct result of instruction.

The above applied in the plant in question, because the students there were minor executives whom the management advanced, or who retained their ranks, on the strength of special training as well as experience in the various departments. In a manner the training course was employed to help sift proper candidates for the supervisory position.

Group training of foremen, however, involves no definite obligation on the part of the foreman. Very often it is not an outgrowth of the plant training department. Rather it is an evolution of the "get together" practice of factory executives. Very often the instruction is voluntary and the student can discontinue the course without in any way lowering his standing in the factory.

A training course does not always give a fair estimate of a foreman's abilities. It may be that the foreman had been placed in the wrong group. It may be that his educational qualifications were limited, so that he could not follow the study with any benefit. In some plants the foreman's previous educational training is inquired into before he is placed in a group. In one plant the foremen are placed in either of three groups. One consists of foremen and supervisors who have had a college education or some college training; another group consists of foremen who have had a high school education or its equivalent; and a third group consists of those who have had an elementary school education or less. Although the three groups meet separately under different leaders, all the men meet occasionally to listen to a lecture by an expert.

In another plant each foreman-student must pass a special examination in English, history, geography, civics and arithmetic before he can be admitted to the course. This is made necessary partly because the instruction facilities are limited, so only those who will benefit most from instruction can be taken in. In one plant it is the policy to admit only ten men to the foreman-training course. Under the arrangement, two foremen are chosen from each department. This arrangement has also proven satisfactory because the foremen interchange information during the conference and in this way foremen learn of the experiences of the other departments,. with the result that they gain broader understanding of the organization of the plant as a whole.

Where the training facilities are limited, it is often advisable to admit only the best qualified foremen to the course, on the theory that the special training will enable each foreman to act as a leader of a group when the training program is extended to take in the rank and file of the plant's executive force.

Misplacement of foremen can be corrected as the course progresses, but this is not always satisfactory, as it is apt to interfere with the study and often results in loss of valuable time. Even educational qualifications are not always the correct basis of grouping students. In some plants it is found advisable to group the foremen according to their ratings in both education and actual plant experience, and with these is taken into consideration individual characteristics of the foremen.

Professor Walter Dill Scott, the eminent industrial psychologist, who during the war served as Director of the Committee on Classification of Personnel in the United States Army, and has since devoted himself to applied psychology in industry, relates an interesting case which illustrates the point we have just raised.

"There was a three-year-course in this plant designated to train a group of factory employees for minor executive positions," he says in his book, "Science and Common Sense in Working With Men." "This course was designed to provide instruction in all the major production operations of the plant and in the principles of management. An attempt had been made to classify these student employees into three groups, according to their ability.

"The first basis of this classification was the public school record of each man. High school graduates, or men of equal ability, were placed in Section A. Grammar school graduates, or men of equal ability, were placed in Section B. Men having less than eight years of schooling were placed in Section C.

"As time went on, it became apparent that this system of classification was unsatisfactory. It was found, for example, that after considerable time some C men (with only 5th grade schooling) were really able to do the work of the men in section B. Some in section B were found at a later date to be really qualified to do section A work. It was also discovered that some with a high school education were able to do only B work, although they had previously been placed in Section A. Some who had been placed in Section B, because of previous schooling, needed to be placed in section C. Such shifting and transferring from one section to another after the course was under way was undesirable, because it wasted time of both instructors and students and caused unnecessary discouragement to those who had to be demoted."

By a series of mental alertness tests the problem was solved.

THE BLACK HUSSARS

The Story of the Pennsylvania State Police

By FRANK L. MATHER

THEODORE ROOSEVELT, President of the United States at the time, intervened in the Pennsylvania coal strike of 1902 and broke what was perhaps the most serious and distressing industrial disturbance felt up to that time. He appointed an arbitration rd, later known as the "Anthracite Coal Strike Commission." iet at Washington October 24, 1902, and began its investiga- s, continuing to March 18, 1903, when it presented to President sevelt its report—a document of vital and enduring signifi- e. The first of its recommendations was a call for legislative on to create a e police.

amuel W. Pen- acker, who as- ied the office of vernor of the nmonwealth in 3, received the ommendation too for legislative ion that year. But mind was made and the bill was sed in 1905, cre- ng the Pennsyl- ia State Police. e thing was not ily done. There s much resistance, ive and passive, d much fear that create another de- rtment could an only to create other crop of po- ical plums and another drain upon the treasury. The Governor, wever, stood firm, and his will prevailed. The Act was signed ay 2.

Captain John C. Groome, commanding the First City Troop of iladelphia, was offered the superintendency of the new state lice. The City Troop had maintained its high standards for e and a half centuries. It had fought in every one of the coun- 's wars. Captain Groome had been in command since 1896. e appointment brought forth expressions of sincere satisfaction om both urban and rural newspapers. Captain Groome an- unced that, as a condition of accepting the appointment, "there ill be no place on the force for political henchmen or ward liticians, no toleration of wire-pulling in any shape. If, or hen, I cannot run the force on that plane, I shall turn my com- ission back to the Governor, to dispose of as he pleases."

The superintendent was appointed July 1, 1905. There was at ice a wild scramble for jobs. Aspirants flew to the old means approach—senators, assemblymen and influential politicians. perintendent Groome then emphasized the now established state lice policy by reasserting in widespread public print that:

"Politics will not figure in the Department, and the men that shall select will get their appointments entirely on fitness and t through political influence."

The Act of 1905 creating the Department of State Police pro- ided, first for a superintendent to serve a term of four years from ate of appointment. Colonel Groome served for more than fif- en years, resigning on February 28, 1920, in favor of his senior aptain, Major Lynn G. Adams. The second section of the Act thorized the appointment of a deputy superintendent.

Section 3, of the Act, authorizes the superintendent "to appoint the State Police Force." This clause has for nearly twenty years proven the wisest thing related to the state police system. It has been adopted in other states now affording state police. It rests in the superintendent the power to make his organization a model of freedom from political contamination. It is the basis of state police efficiency.

The same section provided for four companies, now known as troops. The amending Act of 1919 added another troop, each consisting of a captain, a lieutenant, a first sergeant, five sergeants, ten corporals,—one of whom shall be a saddler, and one a blacksmith—and sixty-five privates—a total of seventy-eight men per troop. At headquarters, added to the superintendent and deputy, there is a statistician, a chief clerk, and such experts and other assistants as the work of the department requires. The limit of the entire department is therefore about 400 men.

Copyright by U. & U.

Bad Medicine for Pennsylvania Law Breakers

Section 4, of the original Act, authorized the superintendent to fully equip the force; to make the necessary rules and regulations, "subject to the approval of the Governor"; also to distribute the force throughout the various sections of the state, "where they will be most efficient in carrying out the purpose of this Act to preserve the peace and to prevent crime." Section 5, conferred the usual police authority upon the force throughout the state, with this clause: "and are intended, as possible, to take the place of the police now appointed at the request of the various corporations." (This aimed particularly at the old "coal and iron police," hired by corporations and commissioned by the state at one dollar per man—often common gunmen and riffraff of bar-rooms.)

The state police are also authorized and empowered to act as forest, fire, game and fish wardens, and are obliged whenever possible, to cooperate with the local authorities in detecting crime, apprehending criminals and preserving law and order throughout the state.

Except for minor changes, reference to salaries and so on, in subsequent amending acts, the foregoing records are all that is of importance in the creative Act of 1905, since which time Pennsylvania has maintained its state police, of which, at the St. Louis convention of the International Association of Chiefs of Police, Colonel Mills (then chief of police in Philadelphia) said:

"Our people in Philadelphia regard the Pennsylvania State Police as the best law enforcement agency in the United States, if not in the world."

The Pennsylvania State Police, now located in its four barracks and distributed in detachments of two and three men at sub-stations, began active duty on December 15, 1905. The first activities were of a general and various nature. A country store robber was picked up here and there; a farm thief was apprehended; killers of songbirds were arrested, and so on, while the troopers often had their little difficulties with the unassimilated foreign element, teaching it by small but repeated object-lessons that laws would henceforth be enforced in Pennsylvania and order preserved.

Came the industrial disturbances of the Spring of 1906. Ten thousand mill workers in the Punxsutawney district staged a riot that the sheriff could not control. The timely arrival of a small detachment from "D" Troop barracks restored peace.

Shortly after, Troop "C" received a call from Labanon County. Five hundred angry foreigners had assaulted inoffensive workmen and routed the sheriff's deputies. The sheriff telephoned for aid:

"Send your *whole force;* these rioters are desperate."

A sergeant and ten men were dispatched there in a caboose and engine.

The smallest trooper forced his way boldly into an angry crowd, disarmed a big foreigner who showed fight, swung his stick just once, the big one dropped, the crowd ran like sheep, and the whole affair was ended.

Six thousand employes of the Philadelphia Rapid Transit Company went out on strike in February, 1910. Gangs of roughs and rowdies, "strike sympathizers," caused a situation that Philadelphia's 5,300 city policemen proved unable to control. The "State Fencibles," a military organization was called out, but the mob took the rifles away from many of the men and threw the "soldiers" through windows. The police were required to come to their rescue.

Disorder, riot, and destruction of property grew apace. The city police admitted they were unable to cope with the situation. The director of public safety and superintendent of city police called upon the Governor for the national guard. The Governor replied:

"When they have eaten up the state police, then I will give you the guard."

On February 23, 1910, the order reached all four barracks of state police to mobilize. Men were called from far-scattered substations. Some of them had sixty miles to ride before they could rejoin their troops, but by six o'clock "A" Troop, at Greensburg (about 25 miles from Pittsburgh) was entraining, "B" Troop was marching through Wilkes-Barre at 6:30 and by midnight all four troops were off. Less than twelve hours after the order was first given, a squadron of 178 of the state's men was on duty in Philadelphia.

The story is that the local authorities planned to assign detachments of the police to different wards through the city. When they acquainted the superintendent with the arrangement he refused to accept it, foreseeing the danger of divided authority, with no one responsible for mistakes.

"Give me a certain section of the city that 178 men can cover, take your men off the streets in the morning at 8 o'clock, and I will be responsible for the maintenance of law and order in my section," he declared.

They gave him Kensington, the heart of the manufacturing region of Philadelphia and the seat of the most obstinate violence.

The squadron entered the Kensington district, led by the superintendent, the troopers riding in column of twos, horses at a walk. Carbines had been left behind, but at each man's hip swung a heavy "forty-five"—and a pair of handcuffs.

Every face was set straight to the front. Not even an eye looked to the right or left. The word fled ahead of the advancing column—

"The Black Hussars!"

Without an order given or a word spoken, the streets emptied. These perfect specimens of the finest physical type of men, mounted on small, wise, wiry horses of the plainsmen's breed, moving silently through various streets, drove their moral home.

Divided into small groups, the squadron was scattered over the whole district. Following a number of arrests the first day, quiet set in and, although the men remained on duty eighteen hours a day, they experienced little difficulty in preserving order. From the first day cars ran throughout the district regularly and with perfect safety. Not a single shot was fired by the force during the entire tour of duty.

FEARS NO PANIC

There have been only four presidential election years since 1800 which have been marked by business depression, declared Dudley F. Fowler, of the Bank of America, New York, in his latest radio talk on economic conditions. In all the other twenty-seven presidential election years there occurred no marked business disturbance, but, on the contrary, in the majority of them, conditions actually improved, Mr. Fowler points out after closely studying this timely problem. Mr. Fowler said:

"The last presidential election was held in 1920, which year marked a crisis in the business affairs not only of the United States but also of the world at large. Cancellation of contracts was widespread, and as a result business failures were numerous. Thus a presidential election and a business crisis both occurred in the same year. The previous presidential year of 1916, which gave the Wilson Administration a second term, witnessed a tremendous boom in practically all lines of industry, and it is estimated that over 30,000 new corporations were organized. The preceding presidential year of 1912 is memorable for a bitter political controversy which resulted in the creation of a third party. From the business standpoint there was no decided trend, but it is worth while to note that commodity prices rose sharply and the essential industries such as railroads and pig iron producers prospered.

"The panic of 1907 continued to exert its depressing influences over into the presidential year of 1908, but in the fall general business conditions improved, and by November prices on the stock market experienced a considerable rise. 1904, which gave Roosevelt another term, was an active year in many lines. Considerable railroad construction was undertaken, and the stock market reflected the general prosperity of the country. The first year of the new century which marked the re-election of McKinley brought good times to the United States, and while the stock market suffered from a slump in the spring, a high point was attained by the close of the year.

"In the previous century, of the twenty-five elections, only three were accompanied by marked depressions. These occurred in 1884, 1860 and 1808. The panic of 1884 was brief in duration and was mild in its effects. The financial troubles of that year were brought to a head by the failure of an important business house, but the disturbance was fundamentally due to unsound economic conditions which had already existed for some time before.

"The year 1860 closed with a widespread panic which gripped the entire North. Here is a true instance of an American panic caused directly by the political situation, but it must be remembered that the South was seceding from the Union and the very life of the nation was in peril.

"The panic of 1808 was caused in a way by political conditions, which, however, were not national but international in nature. At that time the Napoleonic war was being waged, and for a number of years our wheat and cotton were in great demand and were being transported by American vessels both to England and to France. This trade was later checked by the restrictive measures of both belligerents, and American business suffered severely, with the result that a serious depression occurred in 1808.

"It would thus appear that history affords little support for the belief that the uncertainty arising from political elections is a direct cause of business disturbances."

HIGHER MOTOR CAR PRICES

The opinion that automobile prices should go higher was reiterated recently by A. S. Sloan, president of the General Motors Corporation. He said:

"Automobile prices I believe are at the low level. Prices tend to increase with better values to be offered. Stocks of automobiles on hand are being liquidated and by July or August they will have been pretty well exhausted. There will be no bargain sales of automobiles. Production is gauged to meet the requirements of the trade. One of the big troubles in the automobile business is that dealers and manufacturers all have the habit of expecting business every year to be far in excess of that of the preceding year."

Panama Canal Traffic

The total number of commercial vessels passing through the Panama Canal in March, 1924, was 429, compared with 409 in March, 1923, according to the report of the *Panama Canal Record.* The total volume of cargo carried through the Canal in March, 1924, was 2,272,472 tons, compared with 1,940,928 tons in March, 1923. For the fiscal period beginning July, 1923, and ending March, 1924, the total volume of cargo passing through the Canal amounted to 20,459,153 tons. For the corresponding fiscal period of the previous year the figure was 13,019,201.

Unfortunately the more traffic through the Panama Canal the more loss to middle west industries. Waterways alone will save the day for Pacific Coast and Latin-American business.

REPUBLICAN CONVENTION

No Fireworks But a Business-Like Gathering This Week at Cleveland

By JOHN M. TOWNSEND

CONGRESS has adjourned and, thank God, the country is saved," Chauncey M. Depew once wired a constituent when the national law-making body quit work. There are no Chauncey M. Depews in this congress, nobody left with a saving sense of humor. Now at Congress is out of the way the national conventions are setting stage for the presidential elections in November and it will curious to note what the republican and democratic gatherings ll find worthy of mention about congress in their platforms. the republicans praise Coolidge they cannot honestly praise republicans in congress. The democrats ll laud their investigating committees, claim l the credit for tax reduction legislation d denounce the republicans in congress but eir real job will begin when the democratic ngressmen take the stump for reelection d face a public more or less irate with ngress as a whole.

REPUBLICAN CONVENTION

Calvin Coolidge was nominated for president by the republicans many months ago. e Cleveland convention has been merely a tification meeting, so far as he was conrned. For the first time in many moons the publicans, with the single exception of the nall LaFollete group from Wisconsin, agreed animously on a man and on party measres. Whatever the Cleveland gathering may ave lacked in spontaneous combustion, so r as the nomination for president was conrned, it more than made up in earnest coniction that it was naming a man for the ighest executive job in the country who was orthy of the place. From beginning to end e rank and file of the delegates awaited ather than received orders. The disposition as to give the president what he wanted the platform, in the vice-presidential nomation and in the minor matters to be determined. The senatorial oligarchy which domated the last convention and has tried since dominate the government itself, was releated to a back seat in important particulars. herever the president had deemed it necesary he had prepared planks on moot issues hich for incisiveness and strength of conviction, make the party pledges this year, so far s the president alone can make them, more inding than usual. There are not so many loopholes for party isloyalty in congress as have been contained in all party platorms in recent years. If the Cleveland gathering was not a rip-roaring" success, it was a business-like gathering which new what it was there for and it transacted its business with a elish which assures a flying start for the republican national ampaign.

Copyright U. & U.

Marion Leroy Burton, president of the University of Michigan, who delivered the speech nominating Calvin Coolidge, at the Republican National Convention.

DEMOCRATIC OUTLOOK

As predicted some time ago the LaFollette independent movenent has had more of an effect on the democrats than the republicans in the matter of the business of the national conventions. All the LaFollette republicans could do in the republican convention was to vote for LaFollette and have their platform thrown out of the convention. The practical certainty that LaFollette's ndependent candidacy for the presidency will almost eliminate the democratic party in several western states which the democrats have hoped to carry this year, has hurt.

McAdoo's chances in the New York convention are worst of all, because his vote-getting strength lies in that section. Whereas the democrats have hoped that LaFollette would prove another Roosevelt for them in this year's campaign, they are now fearful that his candidacy will wipe all democratic hopes of victory this fall clear off the map. It is the opinion of many democrats that if McAdoo and LaFollete divide the radical and big city vote throughout the country nothing can stop a republican victory. There has always been doubt in conservative democratic quarters of the wisdom of the alliance between LaFollette and the democrats in this congress and the campaign will not go much further before the progressive democrats will be accusing LaFollette of ingratitude and jeopardizing progressive chances to win the national election this year by his go-it-alone candidacy.

As a result of this situation, there is a manifest disposition among the "old guard" democrats to resist the McAdoo candidacy to the last ditch in the belief that all democrats who would vote for McAdoo as against LaFollette will support a conservative democrat for president and more conservative democrats would vote for him than would vote for McAdoo. The real issue with the democrats remains as in the beginning: Shall we make our campaign in the West or in the East?

DARK HORSES LOOMING UP

While McAdoo is expected to take the lead in the New York convention early in the balloting and may easily have a majority of the convention supporting him, the adherents of Gov. Smith of New York have not abandoned hope, although indications are that they might as well do so, so far as the nomination of the Governor is concerned. The ease with which George Brennan of Illinois upset the McAdoo calculations of running the convention from beginning to end by the mere suggestion that Senator Walsh of Montana ought to be considered for permanent chairman, showed weakness where strength was claimed. McAdoo has no heir apparent to whom he can throw all his votes if a deadlock ensues. The Smith forces are better organized and better amalgamated, but the poor showing of Senator Underwood in the primaries, while it does not totally eliminate him as a candidate or as a tremendous force in the convention, does rob the Smith forces of a strong second string to their bow.

The withdrawal of Senator Ralston of Indiana as an active first ballot candidate, while it may not be final but only some of Tom Taggart's slick political maneuvering, nevertheless weakens the McAdoo opposition in second choices. It is possible that the bulk of the McAdoo votes might go to Senator Glass of Virginia and it is possible that much of the Smith strength might go to John W. Davis of West Virginia and New York, to Senator Copeland or to David F. Houston. former secretary of the treasury, who is not unliked by the McAdoo men as a whole. In fact there is quite a campaign on for him now among the men of money in the party. Another likely "dark horse" is Governor Ritchie of

Vol. 25 June 14, 1924 No. 24

SPECIAL TAX ON MANUFACTURERS

A SPECIAL license tax on manufacturers of three tenths of one per cent on the gross annual revenue is being considered by the Louisiana state legislature.

This is another example of discrimination. Why should manufacturers be subjected to a special tax? They already pay heavy taxes in Louisiana as well as in other states. The higher they are taxed the less they have for expansion, development and promotional activities. Taxing the manufacturer is puncturing the tires of industrial progress.

Excessive taxation is causing a contraction of the industries in this country. Unemployment follows.

Germany, before the war and even at the present time, prospers because the industries are encouraged in every possible way rather than harassed, heckled and hounded as they are in America.

The Louisiana Manufacturers' Association is fighting the special tax on manufacturers. It is also arousing public sentiment against a proposed act declaring ice manufacturing in Louisiana a public utility.

Louisiana, in spite of the boll weevil ravages, is a prosperous state. The industries have made it so. By playing politics the Louisiana legislators are doing their state graver harm than they realize.

FARMERS' FREIGHT RATES

FARMERS want lower freight rates. They have the impression that if it costs less for them to ship their live stock and grain products they will make a lot more money. Everybody can sympathize with them in the desire to secure better prices for their products.

The farmer, like the manufacturer, is entitled to a fair profit.

Unfortunately, there is a good deal of misunderstanding and loose reasoning on the question of freight rates for live stock and other agricultural products. A study just made by the Bureau of Railway Economics of Washington, D. C., shows that the freight charge is a relatively small factor in the price paid to the seller for live stock. Apparently the principal factors in fluencing the sellers' net proceeds are the quality of stock and marketing conditions.

The per cent of distribution of the price paid by the purchaser in 1923 is given as follows:

	Cattle and Calves	Hogs	Sheep
Freight charges....	5.9%	5.2%	5.9%
Other marketing costs	2.7%	3.3%	3.0%
Net proceeds returned to shipper........	91.4%	91.5%	91.1%

A consolidation of all shipments of live stock studied at these designated markets by the carriers on the particular days at three-week intervals shows that out of each dollar paid by the purchaser—

Freight charges were..............	5.7 cents
Other marketing costs were.......	2.9 cents
Net returned to shipper was......	91.4 cents

Coincident with the carrying on of this study by the carriers, a more comprehensive analysis was undertaken by the National Live Stock Producers Association for the year 1923. This analysis was based on the business transacted by the Association during that year at 14 markets, covering the sales of 4,831,707 head of live stock from 29 states, and shows, as graphically illustrated below, that out of every dollar paid by the purchaser—

Freight charges were............	3.78 cents
Other marketing costs were......	2.67 cents
Net returned to shipper was......	93.55 cents

These facts—and they must be facts because the Bureau of Railway Economics and the National Live Stock Producers Association agree—should be taken into consideration in any readjustment of freight rates of commodities.

One of the final actions taken by the House of Representatives was the adoption of the Hoch resolution directing the Interstate Commerce Commission to review the entire rate structure especially with a view to possible reduction of the shipping costs on agricultural products.

The farmer wants relief. He should have relief. He is entitled to a fair profit on his hard work, but in view of the facts as stated, the principal element in obtaining better returns is not lower freight rates.

SMUGGLING IN IMMIGRANTS

NEARLY 40,000 aliens a year are slipping over the Canadian line into the United States. They are Canadians, Italians, British, Fins, Russians, Poles, Swedes and a few Japs and Chinks.

Under the new immigration act of the United States, only 150,000 aliens can come into this country a year, but the number who enter by the under route from the Canadian border on the north and the Mexican line on the south probably reaches from fifty to sixty thousand.

If the immigration act is a good one—and concerning this, opinions differ—it should be enforced more rigidly. The labor unions who are principally interested in the enforcement of the law because it is intended to keep up their high wages, might properly do a little picketing.

Smuggling in immigrants—like smuggling in booze—has become an important American enterprise.

TALKS TO 40,000 EMPLOYES

CHARLES G. DuBOIS, president of the Western Electric Company, talked to 40,000 persons recently by means of a reproducing apparatus. He was able to make every one of the employes understand every word he said. It is the intention to repeat the public addresses frequently.

This is another way by which personal contact can be obtained with employes. The Western Electric Company's plant at Hawthorne is the largest single institution in this country in point of the number of its employes. It is a difficult thing for the president to meet them all face to face, but he can talk to them about some of the difficulties of conducting large industrial establishments and win their cooperation. There already is a large measure of cooperation between employes and the management at the Western Electric Company.

In the old days when a factory was small it was possible for the management to maintain personal contact by word of mouth. The same thing can be done by telephone and voice reproducing apparatus. It is another wonder of the age. It might be a good idea for other factory managers to investigate its possibilities.

COPPER SAVED

PLEASURE and sport have saved the day in many an industry. One shudders to think of what would happen to millions of American workmen if the motor car would disappear. The movie industry likewise furnishes employment to a vast number of people, including the glittering galaxy of stars—who also work.

Lately a survey of the radio industry just completed by the Copper and Glass Research Association discloses that radio apparatus in the United States has consumed 5,000,000 pounds of copper.

If it had not been for the radio industry, copper would be in an exceedingly bad way. Lately the price has advanced and copper mine owners can thank the ingenuity of the inventors who have innoculated several million radio fans.

POSTAL WAGES

IF the highly paid railroad employes of this country would be willing to pass around some of their wealth there would be enough money for the underpaid postal employes. Instead of that, the railroad employes want more money.

It is an uneven world. Special opportunities and special pay for some workers. Under pay for other workers.

CEMENT IN DAYS OF KING TUT

Elder Pliny Wrote of Its Use But the Secret Was Lost in the Dark Ages

One of the early cement kilns erected in England by William Aspdin about 1850.

LONG before the dawn of the Christian era people had been using cementing materials for a variety of building purposes. The Carthagenians erected an aqueduct in northern Africa seventy miles long several centuries before the Roman Empire was established. Vitruvius, architect for Augustus, wrote at length on the uses of cements and plasters, while the elder Pliny mentions cement a number of times in his writings. The tomb of King Tut-Ankh-Amen in the Valley of the Kings, Luxor, Egypt, has only recently disclosed examples of the early use of cementing materials.

All of these early cements were natural cements. In other words, nature was depended on for their formation. The Romans used slaked lime mixed with volcanic ash. They had discovered that such a mixture made a superior building material. They did not know why or how, nor did they understand the proportioning of the materials, or the part the volcanoes played in burning the rock.

The difference between these early cements and modern portland cement is that portland cement is a strictly manufactured product. Its composition is known at all times. Certain materials are pulverized, proportioned, mixed, burned at high temperature and reground to make a standard product. The Roman natural cements depended largely on nature for their proportioning, and on the volcanoes for the burning. There was no dependability and no consistency. Portland cement is a strictly uniform product.

During the Dark Ages the secret of the Romans apparently was lost. It was not until 1756 that an English engineer named John Smeaton found that an impure limestone containing a certain amount of clayey matter possessed the property of hardening under water when burned and reduced to powder. At the time, Smeaton was engaged in building a lighthouse on the Eddystone Rocks off the coast of Cornwall, and by using his new-found material he erected a structure that stood for years before it was torn down to make way for a larger one.

Following Smeaton's discovery other experimenters busied themselves in the cement field and various improvements were made. In 1824 Joseph Aspdin, a mason of Leeds, England, was granted a patent for a material he called "portland cement," because of its similarity when hardened to a rock quarried on the Isle of Portland. Aspdin's chief contribution was his discovery of the value of proportioning, mixing, burning and grinding the materials. However, it is doubtful if he really understood the chemistry of the process, and this field was extended by Isaac C. Johnson, also an Englishman. During this same period other men were engaged in cement research in France and Germany, and much valuable information was contributed by many of them.

The first effort to produce portland cement in the United States was made in 1872 when a plant was established at Coplay, Pennsylvania, by David O. Saylor. At that time imported portland cement was securing a strong foothold on the American market. In England, where the industry had been founded in 1824, decided progress had been made, but very little information pertaining to portland cement manufacture was available in this country.

Saylor had been making natural cement for some years before his venture into the portland cement field. His action in establishing a plant started other manufacturers experimenting and within a few years plants were being operated in various parts of the country.

Many interesting stories are told of the efforts of the early pioneers to perfect manufacturing methods. Saylor would carry pieces of rock home in his pocket and burn them in his cook stove in carrying out experiments. John K. Shinn, another early manufacturer in Pennsylvania, converted a bent car-axle into a primitive crusher by suspending it from a spring pole and bouncing it down on the raw materials.

A few months after Saylor's embarkation in the portland cement business, Thomas Millen of South Bend, Indiana, began the manufacture of the material. At that time Millen was engaged in making concrete sewer pipe, getting his cement from abroad. In experimenting with portland cement, Millen would drive into the country and dig a pail of marl from the lake region near Notre Dame, and a pail of clay from the river and carry them back to his pipe factory where he would mix and burn them in a piece of sewer pipe. He would grind in a coffee mill the product resulting from the burning and in a short time developed crude kilns and grinding machinery and manufactured portland cement for the United States government.

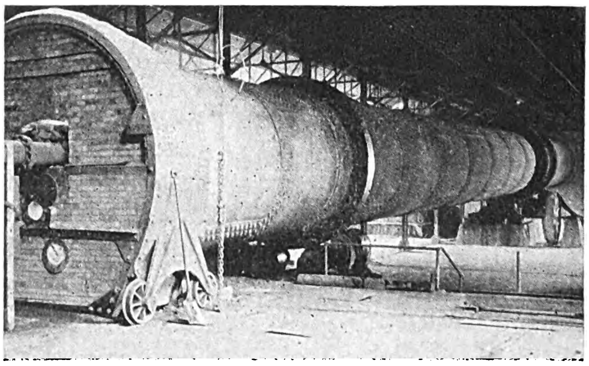
During this early period, imported cement had become so popular that the American manufacturers had a difficult time selling their product. In fact it was not until 1900 that production of local cement surpassed the sale of imports.

The first portland cement mill west of the Mississippi River was not established until 1880, when the industry was started in San Antonio, Texas. At the present time there are 127 portland cement plants in the United States.

Where the Cement Goes

ESTIMATED distribution of Portland cement by uses according to U. S. Geological Survey:

	Per Cent
Public and commercial buildings	24.9
Dwellings	9.4
Sidewalks and private driveways	6.9
Miscellaneous farm uses	20.6
Concrete pipe for water, sewers, irrigation and culverts	4.3
Paving and highways	24.0
Railways	5.2
Bridges, river and harbor work, dams and water power projects, storage tanks and reservoirs	3.0
Miscellaneous uses	1.7
	100.00



A modern rotary cement kiln in which the raw materials are burned to clinker.

President E. C. Heidrich and Secretary John M. Glenn of the Illinois Manufacturers' Association are attending the Republican and Democratic conventions.

DISPUTED TAXES

Some new and valuable features of the new Federal Revenue bill are pointed out in the Kiplinger Washington letter.

In cases of dispute over the proper amount of tax due, in the past the taxpayer had to pay up, then claim refund, and fight for months or years to get it. In the new measure the taxpayer can decline to pay and the government must sue in courts to collect the disputed amount, thus throwing the burden of proof on the government. If the court finds the taxpayer acted frivolously, or to delay, or in bad faith, then it assesses 25 per cent additional for penalty. This provision was dictated by complaints from taxpayers due to slow red tape system of administration in the past, but it is criticized in the letter as bad for the government in the future as it will hold up hundred of millions of dollars in disputed cases.

It is also pointed out that under the new tax act taxes and profits will be public record and profits can be calculated from taxes. Collectors will post the names and amounts of taxes paid. The purpose of the law is to catch evaders, but the tendency will be to disclose private business.

Employees Take a Profit

Though June 2 was not pay day, 9,177 employees at the Schenectady Works of the General Electric Company were paid approximately $130,000 on that day. This represented their return for the six months ending June 1, on savings which they had put to work by investing in the G. E. Employees Securities Corporation.

This Corporation was formed in 1923 by the General Electric Company to encourage saving by its employees. The Employees Securities Corporation originally issued $5,000,000 of 6 per cent fifty year bonds and 10,000 shares of par value capital stock.

The General Electric Company agrees with the original bond holder, in whose name the bond is registered, to pay semi-annually an additional 2 per cent per annum, making the return eight dollars annually to any employee holding a $100 bond.

Up to the present time there are in all 23,281 employees who have paid in full for a total of $8,213,280 worth of bonds, In terest received by employees to date amounts to $301,074.64.

E. O. Brown Promoted

Edwin O. Brown, manager of the properties of the Illinois Power and Light Corporation at Galva, Ill., will succeed D. W. Snyder, Jr., as manager of the company's utilities at Bloomington, Illinois.

The Bloomington position was made vacant several days ago when Mr. Snyder was promoted to vice-president and made a director of the Illinois Traction Inc., a subsidiary of the Illinois Power and Light Corpoartion, with headquarters at Springfield, Illinois.

Edwin O. Brown is well known in electrical activities in Central Illinois. He is the son of E. L. Brown, Elmwood, Ill., a pioneer in the building of electrical plants in the state. The elder Mr. Brown built the first alternating electric plant in Illinois at Elmwood in 1891.

Freight Loadings

Freight loadings on rail lines operating east from Chicago and St. Louis reflect the general slowing down of production in the majority of lines. General merchandise sales are smaller, and this is shown in the less than carload loadings, which have shown a considerable falling off. Conditions on the southern roads in regard to freight loadings have not changed much. The movement of general merchandise is fair.

Obituary

Announcement is made of the death of James F. Collopy on May 27. He was president of the Acme Asbestos Covering and Flooring Company, and a member of the Illinois Manufacturers' Association.

Autos Third in Export

Exports of automobiles and parts in 1923 ranked third among all commodities shipped from the United States, according to announcement made by Percy Owen, chief of the automotive division, Department of Commerce. The value of exported automobiles and parts was $166,000,000, a 70 per cent increase over 1922.

Standing far in advance of all other manufactured articles in the export tables automotive products are exceeded in value of foreign shipments only by unmanufactured cotton and refined mineral oils, valued respectively at 807 and 326 million dollars. Fourth in the list is coal, followed in order by tobacco leaf, lard, wheat, refined copper, wheat flour and boards, planks and scantlings.

Industrial Alcohol

Prohibition regulations limiting the amount of alcohol which may be withdrawn from bond for industrial purposes were set aside by the District of Columbia Supreme Court, which declared invalid those sections of the treasury regulations drawn in accordance with the Volstead act.

The decision came in an injuction granted Gloria Products Company of Brooklyn against Secretary Mellon, Revenue Commissioner Blair, and Prohibition Commissioner Haynes restraining them from exercising further authority under the regulations.

Many manufacturers in the middle west have been seriously hampered by the prohibition regulations on alcohol.

Ford Shoals Bid Held Over

Henry Ford's proposition to the government to lease the Muscle Shoals power facilities has been abandoned for at least this session of Congress. Some of the southern manufacturers' associations objected to it on the ground that it would enter into competition with manufacturing enterprises in the south by giving Mr. Ford unusual advantages in cheap power.

The matter will be brought up again when Congress resumes session in December.

Tide Water Oil Sales Corporation

Through the Industrial Real Estate Department of the Central Manufacturing District Bank, the Tide Water Oil Sales Corporation has purchased a site from the trustees of the Central Manufacturing District of Chicago, and the trustees have begun construction of a building comprising tank house, warehouse, garage, and office quarters at 1455 West Thirty-seventh Street.

Moves to Springfield

J. D. Broome, downstate field secretary of the Illinois Manufacturers' Association, has moved from Alton to 922 S. Lawrence Street, Springfield, Illinois, in order that he may be in close touch with the legislative situation and be in a position to give the greatest service to members of the association. He will be "Johnny on the Spot" when needed.

Short Legislative Session

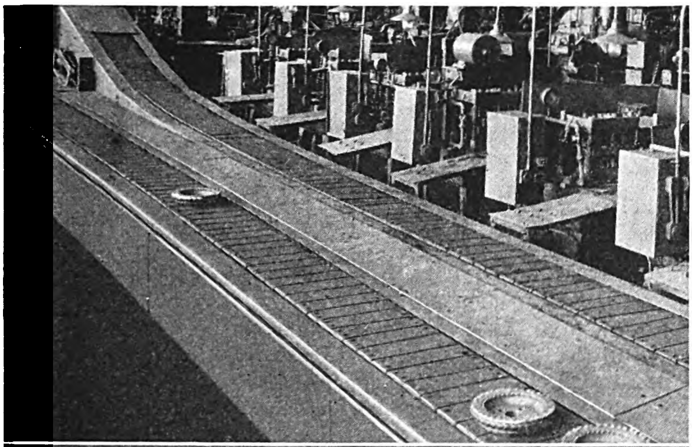
The Illinois Manufacturers' Association is strongly in favor of an early adjournment of the next General Assembly. It is suggested that manufacturers obtain the views of their candidates for the state legislature on this proposition. A good many candidates favor a sixty day session.

Flexible Shafts

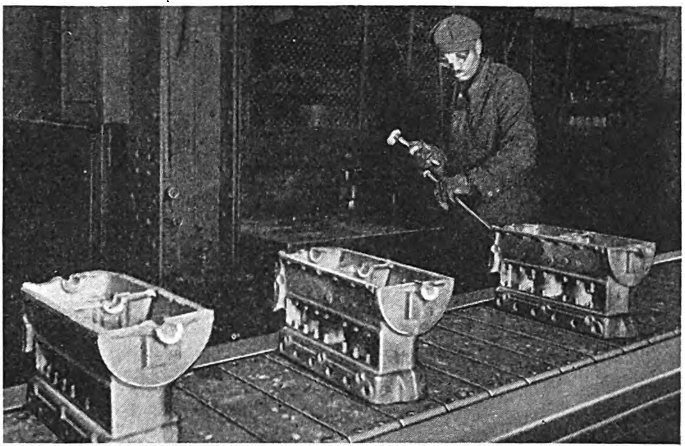
N. A. Strand and Company, 5001-5009 North Lincoln Street, Chicago, have just issued a complete catalog on Flexible Shafts and Equipments. They have added many new types to their line as well as several new attachments.

Western Grocers Elect Officers

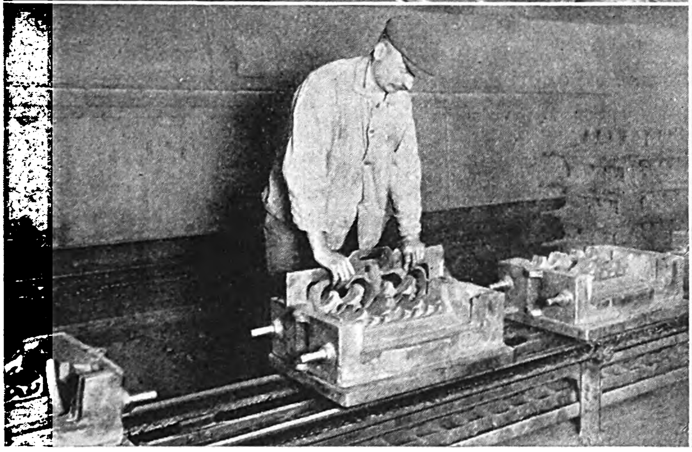
At the recent meeting of directors of the Western Grocer Company, held at Marshalltown, Iowa, besides electing C. C. Virgil, president, the board promoted Second Vice-President R. W. McCreery to the position of first vice-president and general manager, and made Frank E. Brewer, second vice-president, and W. T. Smith, third vice-president. C. E. Sawyer, secretary, and A. P. Iouaid, treasurer, were re-elected.



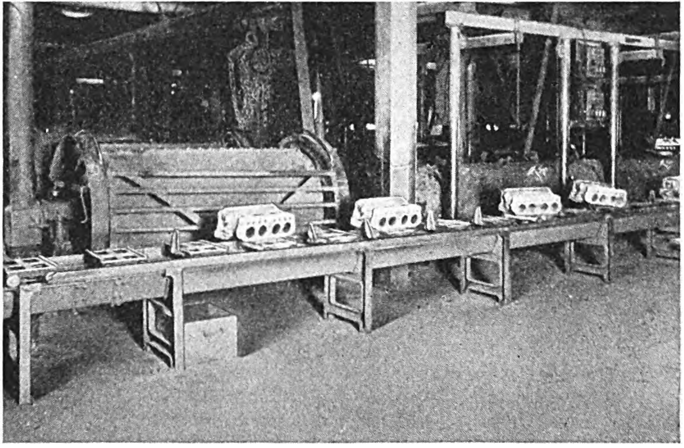
The entire outfit of the huge machine shop at River Rouge is transported on these two finished stock conveyors.



Rough stock conveyor leading from foundry to machine shop. Chipping operations performed in route.



Portion of one of the seven heavy "drag systems" on which Ford cylinder molds are constructed "on the move".



Especially designed Link-Belt cylinder conveyors lead to the heavy tumbling barrels and delivers tumbling castings to the rough stock conveyor.

SHOP transportation has been brought to the highest degree of perfection and efficiency at the Ford Plant.

The cost of handling the rough and finished castings for 500 Fordson Tractors and 500 Ford Car Cylinder Blocks which are machined every 24 hours, has been cut to a minimum.

From the foundry on through the machine shop, to the shipping platforms, Link-Belt Conveyors handle this enormous production, resulting in the elimination of transient storage and trucking.

Thus the square-foot floor space overhead, and investment in stock-in-process, are both reduced to the absolute minimum.

The co-operation we were able to give the Ford Engineers in helping them towards efficient material handling and labor-aiding methods is available to every manufacturer desirous of cutting his overhead.

The Link-Belt line covers material handling equipment of all types, elevators and conveyors, locomotive cranes, crawler cranes, electric hoists, portable loaders, etc. Let our engineers show you how Link-Belt equipment can effect similar results for you. Send for catalogs.

LINK-BELT

BRITISH TRADE FACTORS

Lower Wages Than in United States But the Average Production Is Smaller

*By A. J. ALLIN-SMITH**

American Trade Commission, Bush House, London

GREAT BRITAIN as a customer of and a supplier to American industry requires no introduction to our business men. Her importance, as a large consuming market, and as a great entrepot through which Americans buy materials from many lands, is thoroughly appreciated by foreign traders. But certain factors today need occasional emphasis to guide the foreign trade activities of the United States, if we ever really develop them seriously again.

For one thing Great Britain is forced to maintain the keenest of interest in open competitive markets overseas. Her population, near 50,000,000 depend on it for their food supply week by week. Her industries are of such large capacity and such commodities that their existence, their operation at any level, depend upon foreign materials and markets. Again her vast mercantile fleet would be worthless, certainly profitless, without the outward manufactured cargo and the complementary inward food and raw material cargo that comes from large-scale foreign trade. Indeed, her shipping business has been close to profitless on curtailed trading since 1920.

These features have a direct concern to American foreign traders. They are both competitive and complementary. The kinds of products exported from England's industry are similar to those which the United States can offer abroad. Theirs is a parallel industrial development. In other words, our manufactured steel, machinery, cotton goods, leather ware, specialties, all compete abroad with similar items from Britain. Even our surplus coal output finds its outlet abroad in direct competition with British coals.

On the other hand, only by British development of certain expensive colonial areas do our manufacturers get some of their very necessary raw materials—their fibers, gums, special ores, fine woods, raw rubber, and many miscellaneous tropical and other products help to sustain our industries. We as a manufacturing nation thus gain in dependence on, and stand a chance to lose in rival marketing against British trade.

On the competitive side, a factor favorable to Britain is her low wage basis. This is entirely aside from temporarily exchange-favored trading. Her craftsmen receive a half or third as much as ours—that is, skilled workmen, like carpenters, plumbers, engineers, mechanics, artisans of many trades do not average £4.010 weekly in full-time earnings. Coal miners, iron and steel workers are only around £3.0.0. Compare those figures today with the exceptionally high wage levels in America.

At first glance, that wage-position may be thought exceedingly favorable to Britain in gaining overseas outlets for manufactures, on a lower-price basis. It is less of an advantage, however, when one learns that the average English workman produces on a smaller scale than an American artisan. There is not the scientific layout of plant, nor the same careful selection of workers; neither a ready adaptation to new methods and machinery, nor the same attitude toward large-scale production that characterizes even the "small" manufacturing establishment in the United States. An air of tradition-bound conservatism still pervades industry abroad. Many old plants in British industrial centers are so cluttered or confined that only a wholesale scrapping would enable modernization. The workers have yet to acquire a receptive approval of up-to-date machine methods. Those few plants abroad which are most efficient frequently have large installations of ingenious American mechanical equipment.

There is, to be sure, a growing tendency toward betterment, both of men and of methods for a given job. But it, like all other novelties to Europe, will take time, even years, to permeate the conservative crust of the Old World. Until then, these conditions which seem to menace our foreign trade are only potential; they will not really be the determining features of American accomplishments. Only the energy of aggression and the scale of surplus over domestic demands on American wares will guide the extent to which our business men enter the open markets overseas in direct competition with Britain.

And at the same time, we may look upon the British Isles as a considerable blessing in that she is the leading customer, is readily reached, and bought over $880,000,000 worth of American merchandise in 1923. She supplied us with numerous products in 1923 to the extent of $404,000,000, or very close to the aggregate of imports supplied by South America.

Superficial observation, or casual reading, are not unlikely to lead to the inference that British trade is poor, that production is inactive and that in general there is pronounced pessimism in the British business world. Many American business men are heard to say that "Europe has gone to the dogs"; that "Britain has no chance," and like comments. Certain elemental facts reveal virtually the contrary, however, so far as Great Britain is involved. From these it is hardly too much to reason that British business is actually sounder today than at any period since the war, although the volume of business has long been much below capacity.

A few fundamental indices will serve to reveal a quite favorable position for Great Britain. Small steady progress has been recorded for the past two years in underlying conditions. Coal output and export trade today are approximately at pre-war levels. Iron and steel production is exceedingly high, considering the unresponsive state of important foreign markets. Price indices generally have undergone a remarkable deflation and the cost-of-living there shows a reasonable stability. The unemployed in insured trades, at about 1,050,000 is little over half what it was in the worst post-war period. Bank clearings, in both London and the provinces, have been enlarging consistently over a long interval.

Finally, and significantly, the British alone among leading Europeans are balancing their budget. Their fiscal policy thus shows stability. It has already allowed a surplus sufficient to enable payments on the funded American debt; and its prospects are such that the Chancellor of the Exchequer, in proposing a 1924-1925 budget for the fiscal year to next March 31, recommends, as the newspapers have lately announced, a repeal of the McKenna duties (33⅓% import taxes on automobiles, etc.) and certain alleviations of excise duties on foods and taxes on entertainments. These several items, coupled with a sound but slow improvement in foreign trade since 1922, will appeal to interested commercial men as substantial proofs of a healthy state of business in Great Britain.

One major item that exerts a positive influence is the domestic British political factor. The labour government, in office for the first time, is proving itself to be, not subversive, but submissive to the majority will. Its tendencies seem to be liberal rather than revolutionary; indeed they must be, so long as the support of a liberal faction is necessary to keep the labour minority in power. As the conservative Baldwin Government was dislodged from power by an anti-protection decision, the present inclination in British politics necessarily is toward freer trade.

These are the things that disclose the really substantial underpinning of British business today. To put the patches of news together regularly for a truer, more complete picture, requires a wide reading of both foreign and American press by those concerned about British affairs. Among the best reference should be made regularly to the concise and carefully dispatched economic cables from London published in *Commerce Reports*, the weekly periodical of the United States Department of Commerce.

ILLINOIS NORTHERN RAILWAY
AND CONNECTIONS

Manufacturing Locations for Sale

Along the lines of the Illinois Northern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Illinois Northern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

For complete information, including rates for transportation and prices of land, apply to

T. J. MALONEY, General Freight Agent
606 So. Michigan Avenue CHICAGO

REPUBLICAN CONVENTION

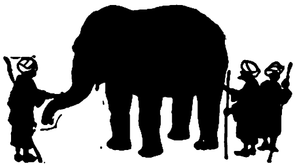
Continued from Page 9

Maryland, who is highly regarded by Barney Baruch who ha financed Ritchie's campaigns in the past as he is now financing McAdoo's. Ritchie is at heart a “wet” although, publicly, h is not “too wet.” Brennan saw him recently and the Smith vot would not be withheld from Ritchie if an eastern man is to b named and he was the best bet in sight. McAdoo has apparently cleaned the slate of far western candidates, so that the democrat convention goes into session called upon to choose the battle-ground and the leader both.

THIRD PARTY CONVENTIONS

LaFollette's group of republican progressives meet in Cleveland on July 4th, to be followed by the Socialists on the 6th. Later in the month the more radical organizations will meet in St. Paul. The railroad unions, the Committee of Forty-eight and the more radical farm organizations will dominate the Cleveland gathering and, apparently, await LaFollette's platform without a tremor. They are more intent upon the man than upon the platform planks, although the nationalization of railroads and immediate farm relief constitute the LaFollette promises which bring about the union-farm support upon which LaFollette will enter the race. Victor Berger has said that the Socialists cannot nominate LaFollette unless he definitely cuts loose from the republican party not only in name but in fact.

Senator George Norris and other republicans in congress who are up for reelection this fall face the same kind of a decision sooner or later. If they support LaFollette for the president while nominated as republicans, the only honest thing they can do is to resign as republican candidates and make independent races for reelection. A lot of Socialists in Wisconsin will vote for LaFollette whether he is the Socialist candidate or not and a lot of republicans in the west will vote for him while supporting the republican ticket otherwise. So far as the farm-labor convention in St. Paul is concerned, LaFollette may denounce it as “communist” and as in direct league with Moscow, but where else can the poor devils go except to LaFollette? The same is true of some of the Germans who have never forgiven this country for entering the war but the bulk of the Germans in this country will think twice before leaving the republican party.



ILLINOIS WATERWAY DELAYS

Continued from Page 5

right of way,” writes Mr. Sackett, “it has been difficult to negotiate for it. Corporations opposed to the waterway, or railroads who do not wish to see it an accomplished fact have interposed such objections and opposition that the State has to fight through the courts to obtain what is necessary.”

Mr. Sackett calls attention to the contest being made at Washington on behalf of representatives of the City of Chicago to get a flow of water for purposes of sanitation and says that if this local proposition did not exist to add to the troubles of waterway construction, much more rapid progress could have been made and there would not have been so great a delay at Washington as was experienced.

Mr. Sackett concludes:

“Considering the fact that Federal government approval was only granted in March of 1920, that one lock has been completed, construction of another well in progress, and another would have been half completed by this time had it not been for the opposition of opponents of the waterway, the writer feels that there is no justification for complaint of inaction in the last three and one-half years.”

HOW THE NORTHERN PACIFIC IS SAVING 11,000,000 FEET OF LUMBER ANNUALLY

NEARLY eleven million feet of lumber are saved by the Northern Pacific Railway every year through Lowry process of treating railroad ties.

About 28,000,000 cross ties are used on Northern Pacific tracks and before scientific methods of timber treatment were brought into use, it was necessary to replace about 2,704,123 of them every year—a total of 95,884,351 lumber feet. Now, less than two million ties are replaced each year, an annual saving of 289,32 cross ties and 10,788,002 feet of lumber.

Treating railroad ties is about the same as frying doughnuts. The contrast between the two processes is this: In frying doughnuts, it is not desired to have the fat soak into the dough but in treating ties the boiling preservative is forced into the wood.

Treated ties dyed to a chocolate brown or coal black are familiar to nearly everybody but the treating process is little understood. Many people believe that the ties are merely dipped in vats of preservative fluid. The process is not as simple as that.

Many thousands of ties are treated every year at the Northern Pacific's tie-treating plants at Brainerd, Minn., and Paradise, Mont. Oftentimes the tie yards contain a million ties. After six months of seasoning they are ready for the process. Loaded on round-shaped tram cars they are pushed by a 50-horse power electric locomotive over a narrow gauge railroad into a huge cylinder 133 feet in length by 7 feet in diameter—for treatment.

The cylinder is closed and the hot preservative, which is half fuel oil and half creosote heated to near the boiling point, flows in from overhead tanks. When 20,000 gallons has entered, the cylinder is full. Then hydraulic pressure is applied and another 4,000 gallons is forced in. All this surplus amount enters the ties, and as there are between 700 and 800 ties in the cylinder at one time, each tie gets about 5 gallons of preservative. When the required absorption has been reached, the pressure is released, the draining valves are opened, a vacuum pump is set at work and the cylinder is drained as quickly as possible.

As the preservative is forced into the tie, the air in the pores of the wood is naturally compressed. With the release of the pressure, the imprisoned air expands and forces out the oil. The result is that about two gallons of oil are recovered from each tie, so that the net absorption is about three gallons. These three gallons add about 27 pounds to the tie's weight. The average green tie weighs from 175 to 200 pounds. Six months' good seasoning reduces its weight by half.

Before treating, the ties are bored for the spikes and adzed for the tie plates, so that the treated tie presents no vulnerable places for the ravages of weather, grubs or insects.

The treating process is highly scientific. Each kind of wood requires some variation in the treatment and rigid attention is given to every detail. It costs 50 cents to treat a tie and half of this sum is for preservative alone, so that all reasonable economy in handling preservative must be exercised.

Birch, ash, elm, maple, red oak, cottonwood, jackpine and other so-called inferior kinds of timber have been made available for ties for the Northern Pacific by the Lowry treatment. In this way the better grade of timber formerly used is now conserved for more particular purposes.

Treatment more than doubles the life of ties. Some ties treated nearly 20 years ago are still in service under heavy traffic and seem to be good for many years more. Between 1916 and 1920, tie treatment saved the Northern Pacific a million and a half ties or 53,940,011 board feet.

Of the 28,000,000 ties now on the Northern Pacific's right of way, 14,500,000 have been treated and in seven or eight years every tie on the system will be saturated with preservative.

Saving to the railroad and the public cannot be measured entirely in terms of millions of board feet. Track maintenance costs have been lowered and there has been less disturbance of the roadbed because of fewer tie renewals and valuable timber resources are conserved for future generations.

THE STUDENT

Continued from Page 6

rding to Professor Scott, the instructor classified the students rding to the progress made in the course. To each classifica- was assigned a certain number of points and the individual men were then grouped in accordance with these ratings. ratings were based on certain simple psychological tests.

uring the war the United States Army adopted a simple ex- ent for rating the relative efficiency of army officers. The ers were rated on five personal qualities: Physical Qualities, lligence, Leadership, Personal Qualities and General Value e Service. Points were alloted to each quality, and the total ber of points for all the five qualities finally determined an er's fitness. After the war the idea was adapted to the needs anufacturing plants. One firm rated foremen according to qualities: Trade Ability, Production, Administration, Train- and Special Executive Qualifications. To each quality were gned five point-limits. Thus, in measuring Trade Ability, the est were 15 points. A high standing was determined by 12 its; middle, 9 points; low, 6 points; and lowest, 3 points. his way the firm could determine the total as well as the vidual fitness of the foremen.

rofessor Scott has drawn up a similar rating chart, also based the recommendations of the Committee on Classification of sonnel in the Army, of which, as has been pointed out, he ed as director. In this chart he names seven qualities. The t is also more elaborate in that the men are judged not only point ratings but as to the degree of efficiency attained in a icular classification. Thus, the first quality is, "Consider his ess in winning confidence and respect through his appearance manner." The rating officer then states on the blank whether piring," "Favorable," "Indifferent," "Unfavorable," or 'Re- ent." Or better still, he places a check over the word that the case. In the right hand column he jots down the num- of points the man is allowed for the respective quality.

he next quality is, "Consider his success in doing things in new better ways and in adopting improved methods to his work." e the foreman is rated for "Highly constructive," "Resource-" "Fairly progressive," or "Routine worker."

he other qualities are enumerated as follows:

. "Consider his success in winning the cooperation of his , in welding them into a loyal and effective working unit.

. "Consider his success in organizing the work of his depart- it, both by delegating authority wisely and by making certain results are achieved.

. "Consider his success in making his department a smooth ning part of a whole organization; his knowledge and appreci- n of other departments.

. "Consider his success in improving his men by imparting rmation, creating interest, developing talent and arousing bition.

. "Consider his success in applying specialized knowledge is particular field, whether by his own knowledge of ways and ns or through his use of sources of information."

his chart should prove of unusual value if used in connection h a training course. It can be filled out before and after the pletion of the course. A comparison will show just how the ining course has affected the foreman's production efficiency. it can be turned into a self-analysis chart, the forman filling ut himself before and after the course. The foreman will thus for himself just how he has progressed. Of course, it is hard- possible for the foreman to fill out the chart himself without ing his own prejudices and partialities creep in. But it must remembered that if a chart of this kind is used in connection h a course of training its only purpose should be that of com- ison, and the foremen should be made to understand that it is d merely as a means of gauging his efficiency as the result of dy, and that it is used for no other purpose.

FINANCIAL

EARLY reports received by the Bureau of the Cens U. S. Department of Commerce, on business co tions in the month of May show the following co parisons: Sales of two large mail-order hous totaled 27,404,000 dollars in May of this year a compared with $33,836,000 in the preceding month and $29,261,000 a year ago.

The price index of 25 industrial stocks, relative to 1913 a 100, remained unchanged from April at 183 and compared wit 186 in May of last year.

The price index of 25 railroad stocks, computed on the same basis, stood at 75 in May, showing no change from the preceding month and comparing with 73 a year ago.

Stock transactions in May were fewer than in the previous month and about 42 per cent less than a year ago.

A total of $305,740,000, representing an increase of about 4 per cent over a year ago, will be paid to investors during the month of June in the form of dividends and interest. Dividend payments will amount to $64,840,000, an increase of 8 per cent over June of last year.

Savings deposits on May 1, were about 8 per cent higher than a year ago.

Interest rates on the New York market declined during May, the average for call money being 3.63 per cent as compared with 4.44 per cent in April and 4.80 per cent in May of last year, while rates on commercial paper at 4.23 per cent may be compared with 4.63 per cent in the previous month and 5.13 per cent last year.

FOREIGN CONDITIONS

The British industrial outlook is improving according to cables to the Department of Commerce as threatened labor disputes proceed toward a peaceful settlement.

The automotive market is particularly good and the prospects for American cars in consequence of the prospective repeal of the McKenna duties are bright.

Iron and steel and lumber markets are quiet and the coal trade is seasonally dull. Decreased consumption of American cotton in favor of Indian and other cotton characterizes the British textile industry.

Marked improvement in Italian government finances is reflected in advance of consolidated five per cent bonds to above par and Italian industry generally is more active.

Bank clearings show a large increase and unemployment a considerable decrease. Exports continue at a high level reducing the unfavorable balance of trade.

Reduction of the official discount rate has stimulated trade and industry in Czechoslovakia, and the general outlook in that country is good.

Approaching elections in South Africa slightly unsettle business, but the diamond outlook is brighter and sales of automobiles and agricultural implements are satisfactory. Shortage of native labor has reduced the gold output. Mine buying continues to be conservative.

BUSINESS INSOLVENCIES

Insolvencies during the month just closed in the United States were again somewhat more numerous than in the preceding month or during the corresponding month of the preceding year, but the losses, measured by liabilities, will be smaller for May than for either of the two months above referred to says the Commercial and Financial Chronicle. Since November last the number of business defaults has shown a tendency to increase in comparison with the figures of the corresponding months of the preceding year, whereas the tendency for the twelve months prior to November last was quite noticeably in the opposite direction. During May of this year the increase in the number of defaults is 18.7% in contrast with May 1923 and this increase is much heavier than that shown by the other months this year—in fact there was in January this year a small decrease.

Mercantile defaults in May this year numbered 1,816 with a indebtedness of $36,590,905. These figures compare with 1,70

What the Taxpayer Gains

Comparison of combined tax paid by arried man with no dependents under the d law, and under the new, as computed Senator Simmons, who proposed the w rates:

Income	*Present Law*	*New Law*
$3,000	$20	$7.50
4,000	60	22.50
5,000	100	37.50
6,000	160	57.50
7,000	250	87.50
9,000	430	167.50
10,000	520	207.50
14,000	940	477.50
20,000	1,720	1,017.50
26,000	2,740	1,737.50
36,000	4,860	3,297.50
50,000	8,640	6,137.50
100,000	30,140	22,617.50
300,000	144,640	109,650.50
000,000	550,640	429,617.50

Credit Unions

Credit Unions, sometimes called "BABY ANKS," are indorsed by the central labor odies of New Orleans and other cities of ouisiana. The proposed bill, now before e legislature of that state, would permit ven residents of Louisiana to apply for ermission to organize a credit union by gning an act of incorporation. Par value f the stock would be $10. The unions ould receive savings, make loans and in- est to the extent of 10% of the capital ock.

The bill also provides that credit unions hall be organized only within groups that ave a common bond of occupation, asso- iation or residence within a well-defined eighborhood, small communities or rural istricts. The rate of interest on loans to a member would not exceed 1% a month.

Similar unions exist in fifteen states and have existed in Europe for many years. In cities it creates credit for wage workers at low interest and in the country assists farmers in short term loan problems.

Can Examine Securities

Safety deposit boxes no longer are private property—strictly speaking—in Kentucky. Section Seven of H. B. 536 passed at the recent legislative session of that state, provides that it is unlawful for a bank or other institution renting a safety deposit box "to permit access thereto by anyone after the death of any person who at the time of his death had the right or privilege of access thereto either as principal, deputy, agent or co-tenant, without the consent of the State Tax Commission or a person by it authorized to issue such consent."

The bank or other institution having in its possession property belonging to the decedent is prohibited from making delivery of the property to anyone without retaining a sufficient amount to pay any tax or interest which may thereafter be assessed under the act.

Haven-Busch Wire Company

The Haven-Busch Wire Company, Grand Rapids, Mich.), to manufacture and deal in mental iron and wire products. Robert H. Haven, J. Hilton and George Busch, all of Grand Rapids, have incorporated for $62,100.

Complete Analysis

The Examination and Diagnosis of Business

Complete Analysis in business is the same as examination and diagnosis in medicine. It is an expert study, *in detail,* of all operations in all departments of factory and office—buying, production, selling, accounting.

Analysis *proves* whether the business is sick or well. If sick, it determines the weakness or ailment, making possible the prompt application of the proper remedy.

Safe and steady progress, unrestrained by doubt or fear, is assured only when the enterprise is in a condition of *proven* health—when the executive has a clear consciousness of strength, with the safe confidence and sane courage, inspired by facts.

For many years, it has been the privilege of Ernst & Ernst, a national organization, to serve firms nationwide in this fundamental work of the complete analysis.

FINANCIAL

Continued from Page 20

insolvencies during April for $48,904,452 and 1,530 similar d faults in May 1923, with liabilities of $41,022,277. The decrea in the amount of liabilities that appears for May this year is d mainly to the fact that there were fewer large failures in th month than in the other months with which comparison is made.

During May of this year there were in all 507 manufacturin defaults with total indebtedness of $17,756,977, and 1,215 tradin failures for $14,346,023 of liabilities. These figures contrast wi 401 manufacturing defaults in May 1923, the total indebtednes then being $16,686,434, while the trading defaults numbered i that month last year 1,069 and the liabilities were $18,959,619. The increase in the number of failures during May this year wa in both the manufacturing and trading divisions, but the decreas in indebtedness shown was practically all of it in the trading class.

Gasoline Makes New Record

The petroleum refineries of the United States established in April, another new monthly record for the production of gasoline, when the output amounted to 754,773,232 gallons, states the Department of the Interior, through the Bureau of Mines. This figure surpasses by more than 11,000,000 gallons the high record production mark made in March, which had in turn passed by 48,000,000 gallons the previous high record set in January.

The largest stocks of gasoline in the country's history were on hand at refineries May 1, according to the Bureau of Mines figures, which show total supplies amounting to 1,607,786,404 gallons. The figures represent an increase of 36,381,737 gallons over the figures for April 1, at which time a new high mark had been recorded. The daily increase in gasoline production in April, 1924, over the corresponding month in 1923 was 4,524,352 gallons, or 21.9%. Compared with the output for March, 1923, there was a daily increase of 1,183,357 gallons, or 4.9%.

That the millions of automobile owners are consuming gasoline at an unprecedented rate is shown by record-breaking consumption figures. The dometsic demand for gasoline in April was 609,077,546 gallons, a daily average of 20,302,585 gallons as compared with the daily demand in April, 1923, of 16,190,559 gallons, an increase of 4,112,026 gallons daily, or 25.4%. The daily increase in domestic demand for gasoline over March, 1924, was 4,941,318 gallons, or 32.2%. Exports increased 31,851,191 gallons over the preceding month, and imports fell off 5,596,537 gallons during the month.

Coal Continues Slow

There is very little change in the coal situation says the *Black Diamond*. Domestic buying of anthracite continued on a healthy basis in the East, but lagged in the West.

Storing of both hard and soft coal by householders failed to regain much of its ground, as a whole, because the weather has continued unseasonable and the ordering of small lots has been necessary in many communities to keep furnaces going. It is evident to even casual observers that retailers' stock have been exceptionally well cleared up, particularly in the Mid-West, and the presumption is that there will be considerable buying for re-stocking purposes before long.

Despite the fact that industrial conditions on the whole are not as promising as they might be, inquiries from large users have been on the increase lately and that is expected to cause a tangible reaction for the better in the bituminous trade before long.

Changes In Cost of Living

The cost of living in the United States on April 15, 1924, had decreased nine-tenths of 1 per cent from the level of March 15, 1924, as shown by a survey just completed by the National Industrial Conference Board. The most important changes within the month from March to April were decreases of approximately 2 per cent in food prices and 3 per cent in fuel prices. Between July, 1914 1920, when the peak of the rise in the cost of living since 1914 was reached, and April, 1924, the cost of living decreased 20.9 per cent. The increase in the cost of living since July, 1914, was 61.8 per cent.

The Comfort Route

PASSENGER AND FREIGHT SERVICE

Cabin Steamers to EUROPE

THE MODERN TREND IN TRAVEL—

The comfortable, well appointed cabin liner with its moderate priced accommodations—40% less than on express steamers—has opened a new era in European travel. People of moderate means, who have hesitated to visit the Old World because of expense, today are traveling by cabin liners.

To meet the ever increasing demand for this economical and agreeable transatlantic service, the Royal Mail now has four famous "O" steamers, the OHIO, ORCA, ORDUNA, ORBITA—a luxurious cabin liner fleet. Each of these splendid ships is noted for its delightful atmosphere, spacious cabins, broad promenade decks and excellent cuisine. An unsurpassed service at moderate cost, with sailings from New York to

CHERBOURG SOUTHAMPTON HAMBURG
PLYMOUTH BELFAST GREENOCK

PACIFIC LINE

Regular sailings from NEW YORK to SOUTH AMERICA (West Coast) via HAVANA and PANAMA CANAL. *Popular Steamers "EBRO" and "ESSEQUIBO" carry only first and third class passengers.*

GASOLINE, CEMENT, WIRE—WANTED

Other Good Foreign Markets Open This Week

INQUIRIES this week offer opportunities for the sale of America's farm and factory products in thirty-seven foreign countries. A miscellany of goods including automobiles, motorcycles, aeroplanes, lumber, printing office appliances, wall board, steel hoops, industrial machinery of all kinds, herbs, chemicals, novelties, roofing materials, textiles, shoes, radio accessories, office safes, and railway equipment are inquired for.

Australia wants to purchase 500,000 gallons of navy grade gasoline. Egypt includes an opportunity for the sale of 2,000 tons of cement. Uruguay wants to buy 15,000 kilos each of copper wire and copper cable. Rosin in lots of 25 to 50 tons is wanted in Sweden. The complete list follows:

AUSTRALIA—
10503: Gasoline, navy grade, 500,000 gallons.
AUSTRIA—
10461: Oil for insulating electric cable.
AZORES—
10452: Weaving machinery for grey sheeting.
BELGIUM—
10536: Plywood, especially oak.
BRAZIL—
10530: Binding appliances for general use. Guillitines and other cutting machines. Printing presses, rotary, job.
10453: Sawmill machinery and equipment.
CANADA—
10500: Burner equipment, powdered coal, for industrial plants and small units for house furnaces.
10494: Plumbing and heating supplies, first class.
10513: Street cleaners, vacuum, motor driven.
COSTA RICA—
10533: Wall boards for partitions.
ENGLAND—
10468: Cottonseed black grease.
EGYPT—
10489: Binders, loose-leaf, post.
10496: Cement, Portland, 2,000 tons.
10495: Steel hoops for cotton bales, 15 to 20 tons.
FRANCE—
10486: Chemicals, industrial.
10531: Carton paper, tarred, sprinkled with fine gravel.
10486: Herbs.
10464: Hams, free from borax, for smoking.
10451: Match-making machines.
GERMANY—
10515: Aeroplane motor testing stands.
10519: Aeroplane small.
10514: Automobile accessories, all kinds.
10518: Automobiles, small, sporting.
10485: Chemicals, heavy.
10524: Chemicals, heavy.
10541: Leather, upper and sole, for shoes.
10518: Motorcycles.
10524: Solvents.
10507: Southern yellow pine, poplar, walnut, hickory, ash, persimmon, dogwood, oak, spruce, and hemlock.
10524: Wax.
10539: Wooden pegs, best white.
10458: Machines, automatic, for making watch and optical goods screws.
10485: Novelties and specialties, technical.
10541: Shoes, fancy.
GUATEMALA—
10535: Houses, ready cut.
HUNGARY—
10459: Lubricating oils. Machinery. Machine tools.
INDIA—
10487: Soda, caustic.
IRELAND—
10512: Automobile accessories, including hood fittings, window screens, and cushion springs.
10455: Machines for making beads from wood, bone or composition material. Machines for making small chains for rosary beads.
10520: Taxicabs, light, low horsepower.
10512: Tire casings.
ITALY—
10488: Paint and varnish remover.
JAVA—
10506: Boots. Cotton piece goods.
10511: Cotton goods, especially printed voiles.
10507: Cotton goods, especially cheap undershirts.
10517: Fire engines, motor driven.
10507: Fruits, dried, California.
10506: Foodstuffs. Hardware.
10506: Proprietary preparations.
10534: Plywood for tea and rubber chests.
LITHUANIA—
10499: Roofing materials—tin, iron, and steel.
MEXICO—
10492: Lights, ornamental, street and park.
10475: Radio parts.
NETHERLANDS—
10456: Wire nail making and wire drawing machinery.
NEW ZEALAND—
10510: Carpets. Upholstery goods.
PARAGUAY—
10508: Drygoods. Hosiery. Jewelry of medium quality. Knit neckwear. Perfumery.
PORTUGAL—
10502: Colors and paints for cement. Waterproof compounds.
SCOTLAND—
10479: Crystals for radio sets.
SOUTH AFRICA—
10491: Filter and filler, gasoline, for automobiles.
SPAIN—
10516: Air compressors for mines and quarries. Ball mills for cement factories, blende mines, etc. Crushers for mineral. Engines and boilers, gas, oils, and steam. Fittings of iron and brass. Locomotives, electric and gasoline, for mines. Locomotives and supplies for meter gauge railways. Railway materials, electric.
STRAITS SETTLEMENTS—
10497: Safes, office, large cabinet type.
SUMATRA—
10466: Canned fruit, salmon, and sardines.
SWEDEN—
10540: Gloves, leather, workmens.
10523: Minerals. Pigments. Red lead.
10526: Rosin, 25 to 50 tons.
SWITZERLAND—
10460: Machines for making steel shavings or steel wool. Machines, automatic, for making wire needles and flat steel needles.
URUGUAY—
10501: Copper wire and cables, 15,000 kilos of each.
WALES—
10525: Paraffin wax, crude.

Predicts Deflation

A well-known Washington service bureau sees economic foreshadowings of vital importance back of the recent defeat of the McNary-Haugen Bill. The initial stages of a period of readjustment have been entered, the bureau declares. The price scale will be progressively downward for a number of years, it thinks. Wages will be brought down in harmony with the lowered cost of living. There is a world tendency toward lower tariffs, it is contended, and the United States will be driven in that direction. Measures devised to maintain or increase present price levels are growing in unpopularity in Congress, the bureau contends, and it looks for the ultimate rejection of the Barkley Bill, railroad labor, as well as the McNary-Haugen Bill.

LABOR PLATFORM

ORGANIZED labor, as represented by the American Federation of Labor, declares itself for the following issues in the forthcoming political campaign:

A policy of strict exclusion in regard to immigration for many years to come;

Adoption of the Child Labor Amendment;

Recognition of the right to organize, bargain collectively through a labor union and to strike;

Abolition of the power of the courts to issue injunctions in labor disputes;

Repeal of the Esch-Cummins Act, and substitution of the A. F. of L. measure for voluntary arbitration conciliation;

Repeal of the Sherman Anti-Trust Law;

Give Congress power to overrule decisions of U. S. Supreme Court declaring any act to be unconstitutional;

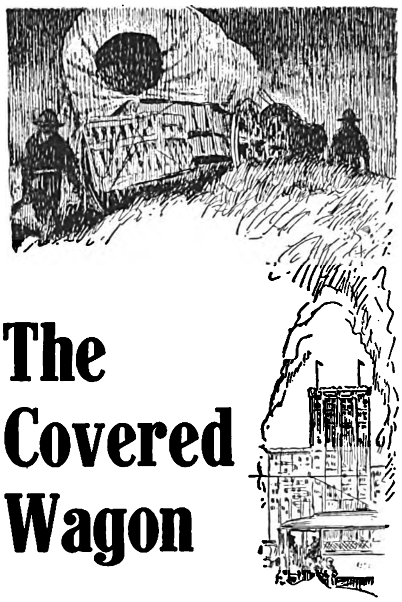
Modification of Volstead Act to permit 2.75 per cent beer;

Support of agricultural measures;

Approval of League of Nations and World Court.

Representative Graham to Resign

Representative Graham of the Rock Island district of Illinois, a member of the House committee on interstate and foreign commerce, will resign his seat in Congress to become presiding judge of the Court of Customs Appeals, the Senate having confirmed his nomination to that position. The vacancy on the committee that will be caused by his resignation probably will not be filled until the December session of Congress.



The Covered Wagon

WINDING its way across the Iowa and Kansas plains, through the treacherous mountain passes, over the burning sands of the deserts, the covered wagon journeyed westward.

After weary months, the pioneers reached the west and built their homes.

Today! A minute—and Chicago is talking with Denver or San Francisco. The covered wagon is a romantic memory. Potent, the throbbing symbol of modern life, the long distance telephone has made the East and West one.

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

Good Suggestion

William Hard, a socialist, who writes for the Chicago *Daily News*, stated recently that "ill-advised and mismanaged propaganda by certain business interests against the bonus bill put the bonus bill through Congress over the President's veto."

Commenting on this observation C. C. Ousley, Secretary of the Associated Industries of Kentucky, says:

"Every well-informed citizen and probably 90% of the Congressmen who voted for the bonus bill will probably say the statement is inaccurate to the point of absurdity. Probably beyond doubt the conviction of nine out of every ten men in the United States is that the bonus bill was made a law because the men who made it a law thought they were paving their way back to Congress.

"But the lesson to which Mr. Hard seeks to lead his readers is not so absurd. He points out that too frequently business men commend or condemn proposed legislation regarding which they obviously are ill-informed. He suggests that if business men want to have influence with Congress they must change their methods, and here are the rules he offers them:

First—When they write or wire to a Congressman, they must show that they individually really have looked at the bill which they are discussing and that they actually know something about it.

Second—They must go about their communities and get some support for their ideas and some supporting letters and telegrams to Congressmen from neighbors of theirs who do not belong to the best business circles and to the best clubs.

Coal Production

"There has been but little change in the depression prevailing in the soft coal industry, and production appears to have found a temporary level at about 7,150,000 tons per week," the Geological Survey says in its current report, which, in part, follows:

The total estimated output in the week ended May 24 is now placed at 7,155,000 net tons, an increase of 124,000 tons. In comparison with production in the corresponding week a year ago there was a decrease of more than 35 per cent.

The total production of anthracite in the week ending May 24 is estimated at 1,850,000 net tons. In comparison with the output in the preceding week this was a decrease of 48,000 tons. In the corresponding week of 1923, production totaled 1,956,000 tons.

Our Growing $ $ $

In terms of wholesale prices of 200 representative commodities the purchasing power of a dollar last week averaged 69.8 cents, compared with what it would have brought in 1913. For March its purchasing power averaged 67.2 pre-war cents, and for the first quarter of 1924 it was 66.4. The commodity prices averaged 143.3 per cent of pre-war level during the week, 143.7 during March, and 150.5 during the quarter.

French Line to Houston

The Compagnie Generale Trans-atlantique has announced that the French Line monthly sailings from the Gulf for Havre will be made from Houston, instead of New Orleans, beginning August 12th.

INDUSTRIAL NOTES

More than two billion dollars were sp by the people of the United States dur 1923 for electrical labor saving devi and the cost of their installation, accor ing to an industrial survey just complet This total investment, for which the ex figure is $2,003,745,000, exceeds by m than half a million dollars the gross rev enue of the electrical central stations of the country for their record output of curren last year.

Labor turnover in the United States i costing the country more than $900,000,0 a year, according to statistics presented to the American Management Association at the annual convention of that body held recently.

One ounce of gold pays wages for twenty hours' work in the United States; fifty hours' work in Great Britain; ninety hours' work in Japan; 100 hours in France, and 200 hours work in Germany.

Portland Electric Issue

An additional issue of $3,500,000 Portland Electric Power Company first lien and refunding mortgage gold bonds, series B, 6 per cent, due 1947, is offered at 94 and interest to yield over 6½ per cent by The National City Company and Halsey, Stuart & Co., Inc. The bonds are dated May 1, 1922 and due May 1, 1947.

The mortgage provides for a sinking fund requiring cash payments of at least $450,000 each year for the purpose of purchasing or redeeming first lien and refunding mortgage bonds of which $15,388,500 will be outstanding, including this issue. The mortgage debt outstanding with the public, including the present issue, is less than 63 per cent of the value of the property, based on an appraisal by the Public Service Commissio of Oregon and subsequent capital expenditures.

How to Insure Sales for Your Product!

The chief asset of any business is the demand for its product. As long as that demand continues, the business is on a sure foundation. But let that demand subside, and every other asset of the business is in danger of becoming a liability.

IN times of prosperity and a rising market there is a general demand for the products of industry that comes to be accepted as a matter of course. It is seldom listed among the assets of the business—it is simply assumed that it will always be there.

But, overnight, conditions may change—as they have done before—and the matter-of-course demand becomes conspicuous by its absence. The business, once strong and flourishing, is suddenly found to be in a very tight place. The demand had not been insured—and yet the entire business depended upon its continuance.

The modern, economical way to insure the market for any reliable product is by Advertising to the public which consumes it. Advertising creates a steadily increasing number of customers who desire the product, and ask for it by name.

Changes in business conditions have little effect on a steady consumer demand for trade-marked articles of common use. The dealer may carry a lighter stock, and for a short time the demand through the jobber may seem curtailed; but just as sure as customers are calling on the dealer for the product, he is sure to supply it, and orders soon begin to flow in to make up for the temporary curtailment. The total consumption continues about the same.

Any manufacturer who has an article for popular consumption that can be trade-marked has the opportunity to insure his consumer market and retail sales by means of Advertising.

During the present business condition the manufacturers who have insured their demand by Advertising are in a far better position—in every way—than those who have trusted to the current demand that was not of their creating.

QUALITY CONTROL *and* ATLAS

WHEN ATLAS is in the making no one knows its destination. One bag may go to build a watering trough on a farm, the next go into some mammoth engineering feat or delicate bit of sculpture. Consequently there can be only one grade of ATLAS Portland Cement, a standard that meets every requirement.

How well ATLAS measures up to that self-imposed standard is indicated by its record on the Panama Canal, where more than eight million barrels were used, tested daily by the Government over a period of ten years, and not one barrel rejected. This is but one of many similar records.

More than mere equipment, mere routine, must go into the making and maintaining of such a record. It is possible only when the same spirit is found in the man in the quarry, in the chemist in the laboratory, in the workmen in every stage of manufacture in the mill—a spirit satisfied with no compromise short of "the Standard by which all other makes are measured."

A large assortment of informative literature, covering practically every phase of concrete construction, is available to contractors or others interested in building. The ATLAS Service and Technical Department also will gladly furnish any special information on concrete construction or the cement industry.

Cadillac Motor Car Co.
by Neysa McMein

V-63

"Contentment"—Absolute contentment in her motor car choice is reserved for the woman who owns a new V-63 Cadillac.

No feeling of dissatisfaction mars her motoring pleasures; no desire besets her for any car other than the one she possesses.

Its rich, distinctive beauty, dominant in any company, is a never failing source of delight to her.

The comfort of its deep, soft cushions, its ease and evenness of travel, and its wonderful facility of operation and control, all contribute to her joy of ownership.

She takes special satisfaction in the safety afforded by Cadillac Four-Wheel Brakes, and in the performance of the new harmonized and balanced V-Type eight cylinder engine—as smooth and quiet as it is powerful and dependable.

Each succeeding ride in the new V-63 confirms her belief in its leadership.

It is the car she desires, and the car she possesses, and therein lies the secret of her enviable motoring contentment.

ONE ANTI-STRADDLE PLANK

EVERY manufacturer, and every wage earner for that matter, should read the Republican platform. You can find in it most anything you want. It is spread over the universe. It runs like molasses—in every direction.

YOU will find the Democratic platform very much the same. It will have planks to please the manufacturer, planks to please labor, planks to please the women and planks to please 'most everybody. It will be another case of a party trying to lift itself into public favor by grabbing hold of its own bootstraps.

BUT, notwithstanding all this, the Republican platform has some good planks and, as Barnum would say, "pay your money and take your choice."

THE most important feature, however, in the document comes direct from the White House we understand. It has to do with law enforcement. Here is what it says:

> We must have respect for law. We must have observance of law. We must have enforcement of law. The very existence of the government depends on this. The substitution of private will for public law is only another name for oppression, disorder, anarchy and mob rule.
>
> Every government depends on the loyalty and respect of its citizens. Violations of the law weaken and threaten government itself. No honest government can condone such actions on the part of its citizens. The Republican party pledges the full strength of the government for the maintenance of these principles by the enforcement of the constitution and of the laws.

WITH Calvin Coolidge and Charles G. Dawes at the helm pledged to the foregoing principles it does not seem to make much difference about Congress. Both men have been tried and have shown courage in law enforcement and under their leadership there will be respect on the part of the people for the laws of the land.

IT is much more important that the laws we have be enforced than that Congress keeps on piling one statute on top of the other. There is one plank at least that is not a straddle.

COOLIDGE AND DAWES

The Republican National Convention

By JOHN M. TOWNSEND

Special Correspondent, Manufacturers News

COOLIDGE and Dawes!

The Republican party, after a convention which started out like a pink tea and ended up with all the outward characteristics of a Kilkenny fight, has done its part toward assuring the country that it will be – by sturdy Americans for four years re. If the democrats do as well, the ers of this country can go to bed on elec- n night sure that LaFollette can't be cted and that things won't be so bad r all.

he ceremony of nominating Calvin olidge for president was a more or less nified affair. Mr. Coolidge had all the es except those of South Dakota and sconsin so that part of the job was con- d to a few tellers who had difficulty making their additions match the vote rybody knew Coolidge would have be- e the count began.

Marion Leroy Burton, president of the iversity of Michigan, who made the nom- ting speech, made an elaborate and dramatic address of great length interest- to the delegates. He was a striking, standing, virile figure on the speaker's trum, imbued with his subject and tre- ndously sincere in praising his friend. remained for the delegates to put the nch into a solemn proceeding like this d they rendered to the head of the ticket generous measure of devotion by going ough the usual convention antics in ap- ved fashion whenever his name was ntioned or whenever somebody turned a well done epigram telling the old ry in a new way. Nobody could com- in with reason that the nomination of olidge was not all it should have been d the delegates were manifestly taking asure in doing the job. Thus far the nvention ran true to form and to schedule.

On the whole the republican platform this year is a clearer, re progressive and better written document than political con- tions usually turn out. President Coolidge "read copy" on it, ote the world court and the prohibition paragraphs himself d also the paragraph on law and order.

Throughout the document there is ample evidence that the tform writers have followed Coolidge's speeches carefully, for president's address to the Associated Press in New York and Memorial Day address in Washington are almost paraphrased in certain of the platform planks.

DAWES

Within a week of his nomination for the vice-presidency, Charles G. Dawes, greeting his friends and neighbors at Evanston, Ill., threw down the gauntlet to "bunk" politics and "bunk" politicians.

By many, his words were taken as a direct defy, hurled by the famous general, banker, economist and "handy-man," against Senator LaFollette and his Congressional adherents,

The senators who came on to Washington to combat the world court plank, definitely pledging the United States to adhere to the existing world court with the Hughes reservations, not only failed in their mission, but could find nobody willing to combat the issue on the floor of the convention and most of them were thrown off the resolutions committee by their own delegations.

There could be no doubt but that the convention as a whole had a battle axe out for the senatorial group which controlled the last convention and have been sniping at Calvin Coolidge for the last ten months. Senator Lodge of Massachusetts even went so far as to tell the delegation from that state publicly that he would accept no honors at its hands in this convention. He was right because he had previously been informed that there was not a single vote in the Massachusetts delegation to give him anything except a back seat, so Lodge was both a prophet and a historian at the same time. Thus far the convention proceeded to do things it wanted to do without a hitch.

It was over the Vice-Presidency that the administration convention machine slipped, slid, stumbled and finally fell all over itself, not once but three separate and distinct times.

The Coolidge contingent came to Cleveland without a Vice-Presidential candidate and under orders from the president to let the convention pick a candidate of its own. When the delegates got their heads together they found they could agree on Frank O. Lowden and that, after Lowden, there were at least thirty "first choices" among the delegations. Chairman Butler delegated to John W. Weeks, four other members of the cabinet and eight or ten other party leaders to ascertain whether or not it was possible to crystallize sentiment on the vice-presidency.

This outfit conferred, conferred and conferred without getting anywhere and in the meantime the rank and file of the delegates were merely waiting word from the President, eager and anxious to follow his wishes. In a fit of desperation the conference determined to draft Borah, realizing that if something was not quickly done the convention would be in chaos. Borah declined. The delegates resented that failure of the leadership. Early Thursday morning Mr. Butler conferred with Washington and immedi-

Continued on Page 18

SAFETY FIRST

Prevention of Accidents by Educational Methods

By ARTHUR WILLIAMS

General Commercial Manager, The New York Edison Company
President, The American Museum of Safety

THE man who holds the most important safety job in America, and probably in the world from the standpoint of the number of employees affected and the money invested, has said that he would rather accept responsibility for accident prevention in a plant that did not have a single mechanical safety device, but where there was the spirit of safety among the workmen and managers, than in a plant where there was every known physical safeguard, but not this spirit of safety. This view is undoubtedly sustained by the earlier experience of our own company when the mechanical or electrical human safety device was unknown, and yet, because of the care exercised by everyone, accidents also were practically unknown. This is perhaps the best commentary on the extent to which education may be relied upon and is demanded for the prevention of industrial as well as civic accidents.

Another indication of the value of education in this direction can be seen in the exhibits of the American Museum of Safety. For many years after the opening of the Museum in 1907, the exhibits were confined to machine guards, safety devices, and safety materials; in the new Museum of Safety, which is maintained in co-operation with the New York State Department of Labor, photographs, stereopticon slides, and other graphic exhibits show the schools for foremen, safety meetings for workmen, bulletin board posters, safety magazines, and numerous other educational means which are now being used effectively for the prevention of accidents in factories, mines, and public utilities.

Safety Suggestions

"Education is relied upon and is demanded for the prevention of industrial as well as civic accidents."

"It is possible to prevent only twenty-five to fifty per cent of industrial accidents through mechanical means. For the prevention of the rest we must turn to educational methods, better supervision and improved morale of employes."

"Carelessness is as much a frame of mind as it is a bodily habit. We are beginning to find out what causes that frame of mind and how to change it."

"Lack of confidence in the sincerity of the employer, or failure to understand the motives of the employer, are often responsible for the frame of mind which is conducive to accidents."

Professional safety engineers who have watched the development of the accident prevention movement from its infancy say that even today, with the hundreds of ingenious safety devices available, with automatic machines which are almost fool-proof, and with safety incorporated in the design, construction, and installation of industrial equipment, it is possible to prevent only twenty-five to fifty per cent of industrial accidents through mechanical means, and that for the prevention of the rest we must turn to educational methods, better supervision, and improved morale of employees.

This estimate is borne out by a recent analysis of some three hundred thousand accidents which occurred over a period of many years in the plants of the subsidiaries of the United States Steel Corporation. This analysis showed that hand labor was responsible for more than forty per cent of these accidents. In commenting on this, Mr. Charles L. Close, manager of the bureau of safety, sanitation and welfare, said the majority of these accidents could not possibly have been prevented by the use of mechanical safety devices or appliances. They were due to carelessness and the failure of workmen to observe the simple precautions conducive to safety. That is why we must devise and perfect educational methods of accident prevention.

What is true in the plants of the steel corporations is undoubtedly true throughout the industries and in public utility operations.

Nowhere is the saying that a safe workman is the best safety device more true than in public utility operations. In most utilities safety and ordinary operating efficiency are so closely interrelated it is impossible to draw the line between them. The New York Edison Company, in the training, of its operating employees, gives special attention to the question of accident prevention. For example, every employee is taught the prone pressure method of resuscitation, not alone as a first aid or safety measure, but as part of his general training. In that company are three hundred men trained to give instruction in prone pressure resuscitation and I have been told that approximately five thousand of the employees of the company have received this instruction and are required to practice this method at least once in four months.

Every employee in the operating department of the company knows, for instance, that a pre-requisite to promotion to any job is a thorough knowledge of the safety rules and practices of that job as well as of his own. He must know not only what is the safe thing to do in any given circumstances likely to arise on that job, but why it is the safe thing to do. In other words, the company requires of its employees not mere obedience but a thorough understanding of what they are doing. Only through such understanding can you have safety in the operation of public utilities. And only through educational methods can you bring about that understanding.

A great deal of the safety education of employees in The New York Edison Company is brought about through talks to the men in groups and as individuals. The company, of course, uses safety bulletins, magazines, motion pictures and the other educational means in common use. The safety engineer is not the only man in the organization who talks accident prevention to employees; they hear it from foremen, superintendents, and managers as well. I believe that as time goes on more will be accomplished for the prevention of accidents by educational methods than through any other means. But we must not overlook the fact that before we can hope to get the sincere co-operation of employees in any educational activity looking toward the prevention of accidents, we must do everything possible to make the place of work safe from the physical and mechanical points of view.

There was a time when most accidents were attributed to carelessness and when we made little effort to find out just what caused or constituted carelessness, but that time is past for most employers and I think for most public utilities. Today we know that carelessnes is as much a frame of mind as it is a bodily habit and we are beginning to find out what causes that frame of mind and how to change it.

We know, for instance, that lack of confidence in the sincerity of the employer or failure to understand the motives of the em-

Continued on Page 19

PROHIBITION

Its Relation to Our Constitution

By ATTORNEY HARRY B. KIRTLAND

THE Constitution rightfully is entitled to our veneration and respect.

It is, and if maintained unimpaired in the principles of its origin, will be forever the keystone in the arch of American liberty.

egarding it, there spreading today, ered by enemies American freedom, moted by those would arrogate hemselves all pow- among our people, erroneous ideas: e, that the instru- nt was meant to ce restrictions on r freedom of ught and action; other, that it is a ed and inflexible of regulations ex- mely difficult of re- ion and amend- nt.

Neither has the ightest foun- tion in fact.

To a right under- nding of this mar- ous document, pro- unced by Gladstone e greatest instru- nt ever struck at e time from the ain of man, we st consider the cir- mstances under ich it was adopted, e conditions which ided its framers.

Our forefath- s had no delusions garding the evils of d government.

They knew well the e old weaknesses of manity, the world ide tendency of des- tic monarchs and still more despotic oups inspired and iven by religious gotry.

Their own fore- ars had fled to the merican wilderness secure religious eedom, and in seven ars of warfare they had wrested their political liberty from English king.

They had seen their own ancestors burned at the stake through e power of that same class of men who today would crucify the bar of public opinion any man or woman who dares, on y matter of public interest, to assert his intellectual freedom and express an opinion not in exact accordance with their own.

They had seen their kin transported for trial before non-resident judges. They had been taxed without representation. They had had a foreign soldiery quartered among them. They had been denied trial by jury. Their homes, their papers and their effects had been searched without warrant of law. Their property had been sequestered and appropriated, without cause and without right, in the name of law, by tyrants possessed of power. Their freedom both of thought and speech had been rigorously suppressed. Their liberty of action, even in the most ordinary affairs of life, had been bound by legislation in which they had no voice.

They recognized the necessity for government.

They knew well the dangers inherent in any government.

They knew the tendency of all governments constantly to encroach on the liberties of the governed, and in establishing their own they meant to limit its power to the minimum essential to the orderly progress of society, and so far as was humanly possible, to prevent its interference with the exercise of individual rights and privileges.

In this frame of mind, justified by their own experience and the recorded history of two centuries of colonization, they proceeded, with the simplicity of the pioneer and the directness of the soldier, to establish the government of the United States and at the same time as they fondly hoped, to prevent that government from trespassing, then or thereafter, on the liberty they had so hardly won.

They embodied their views in the written document we call the Constitution.

Newly completed shrine in Washington, D. C., wherein repose the originals of The Declaration of Independence and Constitution of The United States.

MOTOR TRANSPORTATION

The Relation of the Motor Vehicle to the Railway

By SIR HENRY WORTH THORNTON

Chairman, Canadian National Railways

THE passenger motor vehicle had its inception a little over twenty years ago and one has only to glance at the production records of 1923 and compare them with 1903 to appreciate the stupendous growth of the industry during that period, and when one glances at the 1903 models and makes a comparison with the models of today, some appreciation is had of the evolution which has taken place in the development of the motor vehicle itself. The motor truck, or freight vehicle, is a product of a much more recent period for reasons which can very well be appreciated.

Recent statistics indicate a motor passenger vehicle for every ten people in the United States and for every eighteen people in Canada, also fourteen motor trucks per thousand of population in the United States and six per thousand in Canada, with fabulous sums invested in plants for manufacturing and distributing motor vehicles and motor vehicle accessories.

I have been extremely interested in the development of the motor vehicle industry for several reasons, amongst which could be mentioned:

(1) Its importance as a source of traffic directly and indirectly for our railways.
(2) Because it has become such a potent factor in our daily economic life.
(3) Because it has appeared on the horizon as an active competitor with our railways for certain classes of business.

Our present economic structure is so complex and the process of evolution apparently so rapid that I consider it a wise policy for us to have a free and open exchange of views to the end that we may fully comprehend all the factors entering into the motor vehicle industry and its relation to the general scheme of transportation.

It behooves those of us who are engaged in the operation and development of other transportation facilities to consider very carefully to what extent, if any, our respective agencies may be supplemented by or developed in co-operation with the motor vehicle.

Railway executives, in general, no doubt, have in the past been prone to consider the motor vehicle more as an enemy than an ally, except in so far as that the materials entering into its manufacture and its distribution may have paid transportation charges to their respective railways. Such an attitude is reminiscent of the ditty of the London watermen on the introduction of coaches:

> "Carroches, coaches, jades and Flanders mares,
> Do rob us of our shares, our wares, our fares;
> Against the ground we stand and knock our heels,
> Whilst all our profit runs away on wheels."

Happily, however, reason has prevailed and an honest attempt is now being made to develop, as far as possible, the economic limitations of the motor vehicle as a transportation facility, with a view of assigning it to its proper place in our general transportation structure.

In considering the question of the *adjustment of the motor vehicle to most effectively meet railway requirements*, it is necessary to have accurate data as to its physical limitations and as to the cost of operation and maintenance, including the contribution now made, or which should be made by it, towards the maintenance of highways.

Fairly reliable information is available regarding cost of operation of motor vehicles in passenger service, because this service has become highly organized and statistics in regard thereto have been maintained over a considerable period of time.

The same cannot be said, however, in regard to the motor truck, and it is very doubtful indeed if any very conclusive data are yet available in regard to the contribution which motor trucks should be called on to make, in order that they bear their proper proportion of the maintenance of the highways which have to be specially constructed to accommodate such heavy traffic, the capital cost of important highways running from $30,000 to $50,000 per mile.

It must be quite clear that the motor vehicle, so far as it affects the railway, may be considered from two standpoints:

(1) As a passenger facility.
(2) As a freight facility.

As a passenger facility, it, of course, has to be judged by the ordinary standards the public is accustomed to apply to passenger accommodations, namely:

(1) Its ability to render regular, comfortable, safe, adequate and satisfactory service as efficiently as possible under all ordinary conditions.
(2) The cost of the service.

There does not appear to be any doubt but that the motor vehicle might quite reasonably be expected to fulfill these conditions in regard to a certain limited class of passenger traffic particularly on branch lines and in large terminals, thereby supplementing the existing railway passenger accommodation and, in some cases, permitting the railways to eliminate altogether or at least reduce the volume of non-remunerative passenger service.

From the standpoint of the transportation of freight, however, adjustment of the motor truck bids fair to develop into a factor of some considerable importance in dealing with certain classes of traffic, for example:

(1) The haulage of commodities from the farm to the railroad or water shipping point.
(2) The use of the motor truck in relieving congested terminal conditions.
(3) The use of the motor truck in radial operations from large cities in the delivery of less-than-carload lots of merchandise and raw materials.
(4) In the haulage of perishable farm and dairy products, such as milk, fruit, and vegetables.
(5) In the operation in short hauls between centers of population, where the truck offers a special degree of service in the carriage of commodities from the consignor to the store door or home of the consignee, where time is an important factor.
(6) In longer hauls where rail development has not been sufficiently extensive.

In this connection, I am very pleased to note that a number of the railways of the United States have been carrying on extensive investigations during the last two or three years, with a view to ascertain to what extent the motor vehicle could be adjusted to meet railway requirements. We, on the Canadian National Railways, are watching these experiments with considerable interest, as we feel that we are likely to be faced in the very near future with conditions substantially the same as those at present obtaining in some of the more densely populated sections.

In Canada, as in England, store door delivery has been adopted as a solution of the problem of the freight house congestion and for a long time carriers have provided in the principal distributing centers a cartage, or a trucking service, between their freight terminals and the warehouses or store doors of the "traders."

The service is operated by the carriers under contracts or agreement with teaming companies acting as their agents. It applies to traffic rates in the Canadian Freight Classification as fifth class or higher, less than carload and carload, with the exception of bulk freight or articles weighing 2,000 pounds or over, per piece or package.

SUNSTROKE AND HEAT EXHAUSTION

Their Treatment in Cases of Emergency

By CAPT. G. R. C. FISHER

THE most serious of all hot weather emergencies are without question *sunstroke and heat-exhaustion.*

Unfortunately, many per- ıs seem to think that they are one and same. This is not to be wondered at, ce both are due to the general cause, t weather. In considering these very ious maladies, however, it would be im- ssible to find any two which are so seem- gly alike and yet so different in their ect on the sufferer.

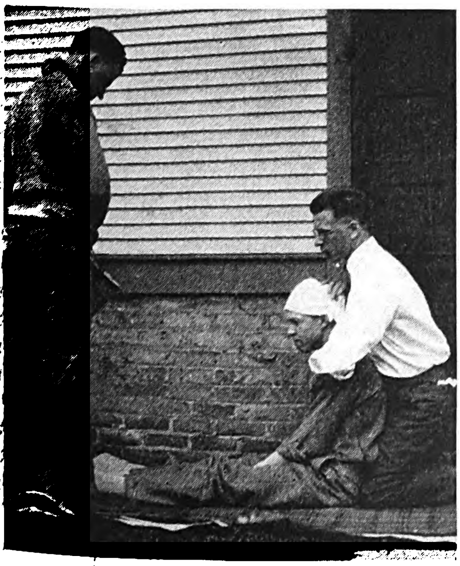
In *sunstroke* the victim is consumed with ourning fever, sometimes running as high 110 degrees, while in *heat-exhaustion* is chilled, his skin cold and clammy, s temperature is low: he is in a state of llapse. Indeed *heat-exhaustion* is even ore serious than nervous shock, and if the edical world confesses that "the phenom- ion of nervous shock is not to be ex- ained," who then will explain the mys- ry of excessive heat causing its victim become cold, to the point of collapse, d the life as a consequence to ebb slowly vay?

It is not difficult to understand that in *nstroke* there must be the speedy applica- on of *cold* to save the victim because of e intense fever. The victim of *heat-ex- ustion* who is cold, *needs heat* and not ld applications.

The superintendent of a large wholesale ouse last summer related to me the in- ance of one of their stenographers who as overcome by the heat. Her girl asso- ates removed her to the rest room, ap- lied ice—and before the doctor arrived e girl had succumbed. With the facts before us is it difficult to understand why more victims die of *heat-exhaustion* than of *sunstroke?*

It will be well to keep in mind the direct causes of these maladies. *Sunstroke* is always contracted out of doors when one is exposed to the direct rays of a relentless sun. *Heat-exhaustion* is usually found *indoors, during hot humid weather,* especially where the ventilation is poor. These facts alone should enable one not to become confused as to which is which.

SUNSTROKE



"Plenty of Cold Water"

HEAT EXHAUSTION

"No cold applications—QUICKLY COVER WITH BLANKET"

A comparison of symptoms will further bring out the differences in these two summer emergencies:

SUNSTROKE

1. A feeling of oppression.
2. A raging headache with shooting pains in the head.
3. A very red face—skin dry and very hot to the touch.
4. A high fever—104 to 110 degrees.
5. Delirious—"out of his head."
6. Hard, labored and often loud breathing.
7. May stop breathing.

HEAT EXHAUSTION

1. A feeling of depression.
2. A dull headache, dizziness, feels sick, may vomit.
3. A pale face (sometimes purplish), a cold clammy skin.
4. A chilly feeling—temperature low.
5. Seldom unconscious, acts dazed.
6. Breathes feebly—often in sighs.
7. State of utter collapse.

As a matter of further helpfulness, we also compare the treatment for these emergencies:

SUNSTROKE

1. Remove into cool shady spot.
2. Strip to the underclothes.
3. Raise to semi-sitting position.
4. Ice to head *first,* then dash cold water on chest.
5. When able to drink, feed victim plenty of cold water.

HEAT EXHAUSTION

1. Remove into a quiet place.
2. Merely loosen any tight clothes.
3. Lay flat on back with head low.
4. No cold applications, *quickly cover with blanket.*
5. When able to drink, aromatic spirits of ammonia in hot water.

Heat-exhaustion may be brought on where the temperature of the factory or shop is over 120 F.

Persons indulging in alcoholic liquor are more liable to suffer an attack because alcohol weakens the powers of resistance.

In cases where workmen are overcome at furnaces, or firemen attending boilers, they should be removed quickly from the cause of their trouble, but not necessarily out to a cool draughty place.

In the open, when exposed to a hot sun, men should avoid drinking ice water, or for that matter too much water; gargling the throat removes much of the "thirsty feeling," and one needs not to drink so much when this is done. When one feels the heat and especially if the face is growing red, it is best to get into the shade, souse the head with cold water, and keep quiet until the threatened attack is past.

For those indoors in humid weather, where the symptoms of exhaustion are observed, have them stop working, lay down in a quiet place, inhale aromatic spirits of ammonia from saturated gauze, and, if feeling sick, take one-half teaspoonful of the liquid in half a glass of water, which should be taken in sips.

Whether in *sunstroke* or in *heat-exhaustion,* if the victim stops breathing, resort to artificial respiration, since it is not impossible that they may be revived. The late Dr. Osler,—the great surgeon—insists that "prolonged artificial respiration if breathing ceases" be maintained. Other treatment can be continued even while resuscitation is applied.

The reader will understand that these suggestions are to be followed *pending the arrival of a doctor.*

Vol. 25 June 21, 1924 No. 25

"REDS"

WITH the opening of the so-called "Third Party Convention" in St. Paul this week, the American public has again been treated by thoughtful—and provident—newspaper editors to another "Red" scare.

Moscow, they say, is seeking to establish a political branch agency in the United States. According to one prominent newspaper, the "dead hand of Lenin calls Third Party to order."

The same newspaper carries, also, a full-length advertisement by a local transportation company, stating that 75 per cent of the men and women in its employ are stockholders. In the "want ad" columns are scores of advertisements—"For Rent, two-flat building, apply owner." Forward in the paper is an advertisement by the Kansas Daily Newspaper Advertising Association—"What a market this great state offers! 1,700,000 prosperous persons who live well—who want necessities and luxuries—who want everything from shoes to steam shovels."

Well, and what? Are these indications of Bolshevism? Does this substantiate the fear that America is to go down—is in any danger going down—before the "all for one and none for all" chimera of "Red" rule?

Bunk! Bolshevism sows fertile seeds where men are slaves, where men are oppressed, where wages are nil and conditions of living low. But here in the United States—

The "dead hand of Lenin" is picturesque as newspaper literature. But dead hands don't exert much pressure, except upon the imagination.

MEXICO

THE United States may well afford to "view with alarm" any discord in the foreign relationships of any of the American republics and European countries.

Four years ago, it was forcibly demonstrated, to the lasting grief of the Democratic Party, that this country is "sot" upon the Monroe Doctrine. That doctrine stands between the American republics and European military or naval force. There devolves upon us, therefore, the tacit undertaking to preserve Europe from untoward action by our southern proteges.

Cometh now the Republic of Mexico, with great gnashing of teeth and twisting of moustachios. Carr-rr-r-am-ba-aa-a! The national honor is insulted. Herbert C. Cummins, in charge of the British legation in Mexico City, is offensive to the Mexican government. The British Government is requested to recall Mr. Cummins at once. And the British Government does—not.

His Majesty's Government is peculiar, too, in this respect, that it takes greatly to heart any overt act against its flag or its embassies. We hesitate to consider the situation that might result through some ill advised action of the populace.

It seems that it would be no more than courteous of the British Government—and, indeed, in accordance with international custom—to accede to the request of the Mexican government and recall Mr. Cummins. His continued presence in Mexico City is an irritation and a possible provocation.

PLEASE!

IF we please you, tell others; if not, tell us."

Remember the old "quick lunch" where this sign was so conspicuously posted? We'd like to enclose a card bearing a similar legend with each issue of MANUFACTURERS NEWS.

MANUFACTURERS NEWS has only one excuse for existing—*service*. If MANUFACTURERS NEWS is of *service* to *you*, either by furnishing you helpful business data, or by presenting you with thought provoking reading matter—TELL OTHERS.

But if there are things lacking—things that you'd like to see in MANUFACTURERS NEWS, and don't—TELL US.

Your ideas of what MANUFACTURERS NEWS ought to be—do we meet them? Or don't we?

MANUFACTURERS NEWS is endeavoring to render a maximum of service to *every* reader. *You* are paying four dollars a year for that service.

If you're getting your four dollars' worth, tell others.

If you're not, TELL US.

MISS DEMOCRACY

THE Grand Old Party having marshalled its cohorts and decided upon its standard bearers in the coming presidentials, Miss Democracy is laying her plans accordingly.

The word has been passed: Find someone who has a chance against Coolidge. Find someone who can fight Dawes.

At the present moment, we don't believe that anyone has any definite knowledge as to who the Democratic nominee for the presidency is to be. True, lots of rumors are flying—but they're flying; they can't be pinned down.

We don't believe that the Democratic Party can find better men than Cal Coolidge and Charlie Dawes. Perhaps it can find as good. It has been four years since the temper of the people of the United States has been tried. We don't believe that the Democratic Party can formulate a better platform than that of the Republican Party. Perhaps it can draw up one equally acceptable to a great many citizens.

What we are driving at is this: The G. O. P. has selected its best men and has announced the terms upon which it believes the country may best prosper this coming four years. We hope that Miss Democracy exerts every effort to equal the men and policies announced by her rival.

The country will never go far wrong if both principal political parties strain every muscle toward THEIR BEST.

PREPAREDNESS

THE blast that changed the battleship *U. S. S. Mississippi* into a charnel house should serve as a warning to those who are of the opinion that our army and navy officers can get along somehow and that preparedness in time of peace is "foolishness."

At the present writing, it is a generally acceptable opinion that the accident aboard the *Mississippi* was occasioned through lack of proper air pressure, upon which depended the keeping of the breech of the big gun clear of sparks after firing.

The *Mississippi*, of course, was undermanned. All of our battleships are. Unpreparedness. Somebody blundered—perhaps somebody who, because of lack of sufficient men, had two men's work to do.

The cost is more than two score lives.

A certain bank maintained an intricate and involved vault requiring the efforts of two men to close and lock it properly. One of the two men assigned to the job fell ill and was forced to lay off work. The other did the best he could, but—

It was a physical impossibility for him to close the vault properly. Robbers entered the bank, therefore, and opened the formerly impregnable vault with comparative ease.

The lone watchman was killed.

A step in time by the bank directors would have precluded both the robbery and the murder. A step in time by the American people will preclude further accidents such as occurred on the *Mississippi*—and will safeguard the nation from robbery at the hands of foreign foes.

THE PROGRAM OF STUDY

Eighth Article on Training Factory Foremen

By J. K. NOVINS

AS a general rule the smaller the group the more effective is the instruction. In a lecture course a hundred or more foremen may benefit by attendance, but the number of men assigned to a group under the group study plan rarely exceeds 15 men. A larger number y interfere with the proper discussion of individual problems. In one plant the foremen-students are grouped in six sections from twenty-five to thirty men in each group, but in the great jority of cases the number falls below that figure. In another nt the group varies from six to twenty men, depending on the ture of the course. In the beginners' course the later figure a safe one, as there is a great deal of lecture work. As the struction becomes more intensive and individualized the group ll diminish in size, most probably breaking up into smaller oups. In many plants the fifteen-men group is the largest han- ed. In one plant the foremen are assigned to nine groups, elve men to a group. In another plant the group limit is six- n. In still another plant the group is limited to ten men.

In some plants the president of the firm will issue a signed call r candidates. This is to impress the foremen with the impor- nce of the contemplated training. The president's call is either the form of a mimeographed letter addressed to the foremen dividually, or in the form of an announcement posted in a con- icuous place on the bulletin board. In the announcement should stated clearly the date the course is to start, the number of urs to be devoted to the study, and if possible it should tell hether the instruction will be during the day or during evening urs. Mention should be made if there is any expense involved the students, and the number that will be accepted for the aining. It should also give the closing date for applications. reasonable time is to announce a month in advance of the open- g date of the course.

In many plants the call is signed by the employment manager, ho, before posting his message probably makes verbal announce- ent to foremen at get together meetings or during luncheons. He ay approach foremen individually, interesting especially those deems proper candidates for the training.

What should be the program for the first meeting of the group? *A good time should be had by all!* The men should be given supper party, with a little music thrown in. The officers of the rm, possibly the president, should be on hand to deliver inspira- onal talks to the foremen. The foremen should be impressed ith their importance in the plant and the influence they may bear n the future of the business. The supervisor of instruction will en deliver a talk, outlining the scope and purpose of the course nd explaining in just what ways the foremen will benefit by the struction. Addresses by executives of the various departments ill impress the foremen with the importance of interdepartmental ooperation. The students should be furnished with mimeo- raphed or printed outlines of the entire course of study with a ist of books to read.

As a general rule, the factory executives arrange the programs or the individual groups as well as secure the necessary speakers. n other plants the programs are arranged by a special committee onsisting of employment manager, superintendent and several ther executive officers. In the more democratically managed lants the programs are arranged by the Occupational and Rights ommittee from data submitted by the shop supervisors.

The students should be furnished in advance with mimeographed utlines of each meeting, preferably a week or two in advance. hey should also be instructed on reading matter relating to the ubject to be discussed at the forthcoming meeting.

The foremen should be instructed to read carefully their fore- nen' instruction book, which contains the company rules and general managerial policies. As this book is sometimes prepared in loose leaf form the students can add new regulations from time to time. The students are told to make constant reference to the Instruction Book, as with each weekly conference they will be in better position to interpret the regulations.

Each student should carry a loose leaf note book in which to enter notes and ideas gained during the conference meeting. The practice of entering notes on odd pieces of paper or on backs of envelopes should be discouraged. The note book should be a permanent record of the course. Some instructors have adopted a policy of discouraging note-taking during the conference, preferring that the students give their entire attention to the discussion. In this case the instructor dictates some brief notes toward the end of the meeting. The trained instructor will be able to dictate intelligent summaries of the entire meeting's discussion in fifteen minutes. If possible the foremen should have separate note books in which to do the home-work problems.

In one plant the routine of the conference is as follows: The employment manager, who has charge of the training of fifty foremen, delivers a talk, illustrating it with problems that have arisen in that plant. A general discussion follows. The conference is then broken up into six groups of eight men each. Each group retires to a separate room to discuss phases of the problem that interest the individual groups.

In another plant the conference starts with the reading of a paper. This consumes a half hour. A general discussion follows. The one assigned to read the paper had a week previous furnished each foreman with an outline and a list of reference readings so that, together with their personal experiences, the men can discuss the subject intelligently.

One plan provides for a fifteen minute talk by the director on the subject, followed by an open discussion among the foremen. The leader puts definite questions before the group members. Here are some of the typical questions:

"In what way does management help the foremen?

"What is the relation of system to organization and administration?

"What are the types of men needed for planning and execution?"

In the standardized course the case system is used. In his preliminary talk the instructor or leader presents a number of experiences in management in the plant and he then asks the students to give their solutions to the problems. The text-books used in the standardized course, supplied by the outside educational institution, also treat the subjects by cases. The reading assignments inform the students of the facts in a particular case, the subject is treated further in the leader's talk, and then it is up to the men to give their solutions.

In presenting a typical case the leader should use fictitious names yet he should be careful to make the circumstances appear as real as possible. The students should imagine themselves involved in a similar situation. In that way their interest is aroused. After stating the facts, the leader puts the problem in the form of specific questions. The foremen are expected to consider the questions from the points of view of what would be the wise, human and logical thing to do under the circumstances. The leader should not state his own opinion, although he might suggest several possible solutions, in which case he calls upon foremen to give their reasons why a certain solution appeals to them most. After discussing the suggested solutions they will then present their own solutions.

In addition to reading assignments, the foremen may be assigned home work—definite problems arising out of the previous meeting, but it is a bad policy to load the foreman with home

“ARE YOU THERE—”

By H. B. ALLIN-SMITH

American Trade Commissioner, London

ONE thing American and British merchants regard as a common advantage is the English language. It is indeed and frequently the medium of readier business dealings than is customary for Americans in any other tongue.

But is it a language in common, even to the English-speaking cousins? That there is a British, and also an American, English is among the first acknowledgements of all tourists. Occasionally some facetious London or Paris shopkeepers, perpetuating the naiveté of Mark Twain’s “Innocents Abroad,” go so far as to announce “American spoken here” on placards in their windows.

This nonconformity is both a distinction and a difference. It occurs in many little things. But they are important enough. Any American exporter or advertiser may find a technical knowledge of these peculiarities helpful to a better marketing of his wares in the United Kingdom.

In the United States spelling and pronunciation and, above all, the meanings of many everyday British words are entirely strange. Simpler spelling of simple words characterizes the American. He habitually writes specialty, aluminum, labor, favor, wagon, inquire, check, show, program; while the British version would be special*i*ty, alumin*i*um, labo*u*r, favo*u*r,, wag*g*on, *e*nquire, che*que* s*h*ew, programm*e*. He writes “Hello,” the Englishman “Halloa.” In pronunciation *gar*age, ca*pit*alist, la*bor*atory, ad*vert*isement, fu*tile* or infan*tile*, co*roll*ary not uncommonly get the emphasis by Englishmen which is underscored. The word “schedule” is pronounced *shedule*. These are merely brief and random examples of the divergencies.

In meanings, however, a much more serious source of distress to Americans is always found. Suppose one goes shopping for the household. In the “High” street of any town, which corresponds to the “Main” street of any Mid-Western hamlet, there is no corner drug store or dry-goods shop. Instead one finds a “chemist’s” or a “draper’s.” Much of the familiar miscellany of a hardware store is to be found at the “ironmonger’s.” The butcher is not the grocer, too. He handles fresh flesh, and fowl, perhaps. His confrere, the “fishmonger” takes special charge of the finny tribe in all its ramifications. Provisions like butter, tea, jam, cheese, smoked meat (bacon or ham) and sundries are usually found in a separate establishment. If this has fowl too, it becomes the “poulterer’s.” The “greengrocer” *does* the vegetables, and flowers. All these are invariably termed the “shops,” not stores.

But the vocabulary of buying is equally perplexing. If one seeks a wrench, or a garden fork, one must request a “spanner” as the former, and in Scotland the latter is known as a “grape.” A “dish-pan” in the Yankee sense is labelled more plainly in vernacular a “wash-up.” A draper is supposed to “stock” (never carry) a line in which may be found that diaphanous weave, cheese cloth. One discovers that, by a strange perversion, the draper understands only the term “butter-muslin” for it. The table napkins admired in the window would more properly answer the title of “serviettes.”

At the provision dealer’s the estimable peanut has risen to the dignity of “ground nut” or descended to the depths of “monkey nut.” A candy store as such is nowhere to be found in the High Street, but the confectioner has many a tempting morsel for sweettooths, described generally as “sweets” or chocolate. Here may be on sale what an American would readily label a brick of ice cream, but would soon discover to be a “block of cream ice.”

Or at home, luncheon may be ready to serve. A meat “pie” perhaps is steaming in the oven, but to conclude the repast there is also a “sweet” in form of “tart” that strangely resembles our national favourite, the “apple pie.” Instead of dishes and silver on the table, which has been “laid” (not set) the same articles are known as “china” and “plate.” After the china is “washed up,” some of it may be placed on a kitchen cupboard or dish-rack called a “dresser.” In the bedroom, however, the dresser as known to Americans has become not the high-sounding chiffonier, but a “chest of drawers.” If the house is steam-heated, it has “central heating.” The ash or garbage container is elevated to the rank of “dust-bin.” House-cleaning is commonly called “turning out.”

At the haberdasher’s men’s underwear is classed as “hosiery” or “mercery,” while socks are “half-hose,” garters become “suspenders” and suspenders change to “braces.” The word “vest” is not synonymous with waistcoat, but the undershirt. “Pants” refer to underwear in England, not to trousers or breeches. The salesman in the shop is a “shop assistant” not a clerk, for the latter (pronounced ‘clark’) particularizes the office employees.

One may purchase a “tablet” of soap at a chemist’s, a “reel of cotton” instead of a spool of thread at the draper’s, “paraffin” instead of coal-oil and “petrol” instead of gasoline, and so on. If one is not a “motor” owner, one rides on a “tram,” the “tube” or the “underground,” or in Liverpool on the “overhead”; street-car, subway and elevated are unintelligible. The “lift” replaces the household elevator. A cold storage warehouse in the American sense is simply a “cold store,” but a warehouse or storage building is the “store.” That is also the term which briefly describes the department store. The barbershop is universally the “hairdresser’s” and usually serves both ladies and gentlemen. Wood alcohol, common enough to the Yankee, assumes a new cloak as “methylated spirit;” while excelsior used for packing is called “wood wool” by the trade. Absorbent cotton, too, is marketed as “cotton-wool,” for “cotton” is the term applied to thread. An English “billion” is a million millions, in the United States it is only one thousand million.

There is no need to exemplify further. These are all random yet representative everyday contracts. The list could go on almost indefinitely, but the moral can be drawn as well with these selections. It must be obvious, to the business man interested in the British market, that taking cognizance of such inconsistencies in American and English “English” means a greater care in the wording of ads, more precision in the drawing of contracts, closer scrutiny of current commercial correspondence between the two nations.

LABOR TURNOVER

Manufacturers who have found labor turnover such a burden in factory operating budgets may find merit in the plan of encouraging employes by promotion. A large silk mill in New England which has general classes for the education and technical training of its employes, is paying particular attention to promotional opportunities. Any workers who wish to fit themselves for better positions are allowed to spend an hour a day, whenever they desire on their own time, on any floor in the mills for the purpose of acquainting themselves with the various machines, their usages and operation.

As soon as the employes feel they have a sufficient knowledge of the work in that department, they are allowed to take a practical examination by the mill manager in the presence of the foreman of the department and the personnel manager. If they pass this examination they receive a certificate stating their competency in that line of work. Prizes are given to all students who are successful in their examinations. When a vacancy arises in the mills, this fact is advertised on the bulletin board and applications are invited, which are considered by a committee consisting of those who conducted the examination and a representative of the workers. Merit alone decides, seniority being recognized only when everything else is equal.

SIMPLICITY

Contributes much to the good record made by Allis Chalmers Centrifugal Pumping Units.

For example a 3″ 5-stage pump in operation in a paper mill has only been packed once in two and one-half years. This pump is balanced by the Allis-Chalmers automatic hydraulic balancing device (which is very simple) and when this pump was opened for inspection the original tool marks still showed on the balance disc.

EXPORTS GROW

Imports Decrease, Trade Analysis Shows

THE National City Bank of New York, in its trade analysis this week states—

Increased exports and decreased imports are the chief characteristics of the foreign commerce of the United States in the fiscal year 1924 which ends with the current month, June. Exports show increases in manufactures and manufacturing material but a sharp fall off in foodstuffs especially grains. Imports show a reduction in manufacturing material but a slight increase in foodstuffs and manufactures. The excess of exports over imports will approximate $700,000,000 against but $176,000,000 in the fiscal year 1923. All these estimates are based upon the latest official figures, those for the 10 months ending with April which show a fall off of 3½% in imports and an increase of 14½% in exports when compared with the corresponding months of the immediately preceding year.

These figures for the fiscal year 1924 are especially interesting in the opportunity which they give to compare our present trade with that of a decade ago, the year immediately preceding the war. The fiscal year 1914 ended but a few weeks before the opening of the World War. The imports of that year were $1,894,000,000, while those of 1924 seem likely to approximate $3,620,000,000. The exports of 1914 were $2,365,000,000 and those of 1924 seem likely to approximate $4,360,000,000. The excess of exports over imports in 1914 was $471,000,000, and in 1924 will apparently exceed $700,000,000, though all of these estimates for 1924 are necessarily based upon ten months' official figures now available. Measured in prices of today the value of the 1924 imports seem likely to exceed those of 1914 by about 90%, and the imports an increase of approximately 84%. The excess of exports over imports seems likely to be more than in any pre-war year and 4 times as much as that of the fiscal year 1923 when it stood at $176,000,000.

The striking feature of the record which ends with this month is the increase in exportation of manufactures and at the same time a fall off in the importation of manufacturing material. Manufactures exported in the 10 months ending with April show an increase of about 15% in value when compared with the same months of last year, while crude manufacturing material imported in the same period shows a decrease of about 17% in value. The chief decrease in imports of manufacturing material occurs in silk, cotton, hides, and tobacco; the chief increase in manufactures exported occurs in machinery, automobiles, lumber, iron and steel manufactures, copper, tin plate and agricultural implements. The fall off in the value of foodstuffs exported occurs in the grains: wheat, corn, rye, barley, oats, and rice, all of which show a reduction in both quantity and value, while meats as a whole show a slight increase over the corresponding months of last year. Exports to all of the grand divisions show increases, those to Europe a gain of $140,000,000, to Asia and Oceania $156,000,000, and to North and South America $47,000,000.

Perhaps the most striking feature of the record of the year is the fact that the total value of manufactures exported seems likely to be practically double that of a decade ago. The 10 months for which official figures of 1924 are available show the total value of manufactures exported at $1,763,000,000 against $920,000,000 in the same months of 1914.

RACE FOR MARKETS

New York Leads; Texas Second

TEXAS is running New York a close second in the race t capture foreign trade, according to Director Klein of th bureau of foreign and domestic commerce of the Department of Commerce. Based primarily on through-bills of lading, which in the case of some states, reflect but a part of their total foreign trade, and for others include goods produced elsewhere, Dr. Klein, for the first time in the history of Government statistics is now able to indicate in a general way the relative importance and standing of each state in the struggle for foreign trade.

Formerly, official trade figures showed only the port from whic shipments were cleared. Inland producers, anxious to find ou what agricultural and manufactured exports came from the regions, have petitioned the Commerce Department time and agai to adopt some new system. While Director Klein points out th the present arrangement and records are not complete, they rep resent a start in the right direction, and it is believed will devel in time into one of the most interesting and valuable surveys of the nation's export development.

Pennsylvania, exporting iron and steel products, textiles, ma chinery, and a multitude of miscellaneous manufactures is third followed by Illinois whose export attack depends largely up

THE SOURCES OF POWER

By DR. FRANK CRANE

Copyright, 1924, by Dr. Frank Crane

THE earliest source of power was the human being. Man did the lifting, pulling and hauling. Then came the beasts, as the horse, the ass and the ox. But these forms of power are imperfect, expensive and wasteful.

Civilization advances as man learns to use the forces of Nature. The expansive force of steam now does the work of billions of human hands and rses' shoulders. The power of electricity, that once cavorted like a wild colt through sky, has been broken to service, and has substituted for a billion more hands.

Little by little the common human laborer that has nothing to offer but his muscle is ing thrown out of a job. Human labor, in the sense of physical force, is being gradu- y pushed off the earth. More and more the human mind is calling in the tireless genii Nature's energies to do its required tasks.

We have hardly begun as yet to master the world we live in. We have barely scratched surface of Nature's efficiency. There is the sun's heat, billions of power volts wasted ery day, power that we have not been clever enough yet to utilize. There is the force the rising and falling of the tides, which properly converted and stored might turn ery power wheel upon our coast. There are vast uncharted fields in electricity we have t yet explored. It is not beyond the bounds of probability that electricity generated Niagara Falls may be sent electrically by wireless and furnish all the mechanical wer needed in New York City. There is the boundless energy of water power that we ve hardly begun to utilize and that some day may oust the use of dirty, cumbersome d expensive coal as motive power.

Experiments have been made in Italy in the utilization of volcanic heat, converting it to motive power. And similar experiments are being made in Japan where there is a nsiderable constant volcanic activity.

An enormous amount of vegetation goes to waste every year, fields of weeds and sea ass. All this may possibly be converted into power. For whatever will rot will make cohol, and it is only a question of time till alcohol shall supersede petroleum prod- ts in the internal combustion engine.

Then there is the power to be loosed by the breaking up of the atom, a field present- g perhaps the greatest of all possibilities, a region into which the scientists have just gun to peep. It is not entirely extravagant to prophesy that the time shall come when an shall be removed from the necessity of almost all physical labor, at least for the urpose of supplying his food, shelter and transportation. Men can then use all of their nergies toward cutting one another's throats, and the great, noble and character building siness of war.

Southern Pine Changes Grades

Changes in the grading rules of the Southern ine Association, made necessary in order to con- rm to the general lumber standardization pro- am as thus far ratified by the regional organi- itions, have been devised and adopted at meet- gs of the association's grading committee and ib-committees on timber specifications and andard sizes and weights. The standardization ogram becomes effective July 1, next, when the anged rules will be operative. The standardiza- on conference has specified that 25/32 of an ich shall be the standard thickness of the former ne-inch" dressed finish, common boards, floor- g, shiplap and dressed and matched stock. This ickness is known as "standard." An "extra andard" thickness for finish and common boards as specified as 26/32 inch. The committee adopt- l the term "standard one-inch board measure" to esignate throughout its rules book, the former ne-inch finish, common boards, flooring, shiplap id dressed and matched stock and reduced the ickness of the first three items from 26/32" 25/32" and increased the thickness of shiplap nd dressed and matched from 25/32" to 25/32". devising a uniform method of working and iatching flooring the committee decided that the /32 inch reduction in thickness shall be made om the bottom of the piece, locating the tongue nd groove 7/32 inch from the bottom surface. his, it is said, will make Southern pine match ith standard hardwood flooring.

A few new sizes and widths were added to ertain items of lumber and the committee author- ed changes in the standard weights of the vari- us items which are to be reduced or increased in ickness by 1/32 inch. This change in weights hould amount to 100 pounds per thousand feet n the items reduced or increased in thickness.

Asks Uniform Motor Laws

The need for fair and uniform legislation on the use and operation of motor vehicles throughout the United States, and an invitation for exchange of ideas on legislation between the national motor vehicle conference committee and motor vehicle associations abroad were high points in the address of H. H. Rice, president of the Cadillac Motor Car Company and chairman of the legislative committee of the National Automobile Chamber of Commerce, at the World Motor Transport Congress in Detroit. The congress was attended by 140 delegates from 42 foreign countries, besides many representatives of the industry in this country. Mr. Rice pointed out that up until 1904 there were practically no motor vehicle laws in the United States and that since that time laws had been passed by the legislatures of every state in the Union, covering both their taxation and operation. In the matter of registration or license fees alone, he pointed out, there is so much lack of uniformity that the fee on a five-ton truck, for example, varies from $40 in one state to $300 in another. He saw the same need for uniformity in laws affecting the operation, particularly those relating to size, weight and speed and traffic regulation.

Consolidated Navigation Company

The Baltimore Steamship Company, operating the Baltimore lines, W. A. Blake & Company, operating the Blake lines, and the Export Transportation Company, operating the Oriole Steamship Lines, announce that their services to the west coast of the United Kingdom and Ireland have been consolidated under one management, to be known as the Consolidated Navigation Company (The Oriole Lines). Offices are at 22 Light st., Baltimore, Md.

A Bridge Across the Years

MAKE it your rule to talk at least once a week by telephone to the son or daughter away at school. The cost of the service is a trifle compared with the joy of hearing the young people's voices and knowing they are well and in good spirits.

And it cheers them, too.

SENATOR WALSH OBJECTS

MANUFACTURERS NEWS Editorial Stirs Congress

THE editorial, "*Congress*," in the May 24 issue of MANUFACTURERS NEWS was made the subject of an impassioned and angry speech on the floor of the Senate on June 4 by Senator Walsh of Massachusetts. Coming as it did, just as Congress was in the midst of packing up for home, the attention brought to bear on this editorial aroused not a few representatives (so-called) of the people, and induced in their minds uneasy visions of what awaited them at the hands of their constitutents when they reported back—with practically nothing to show for their election.

The editorial in question read:

"What's the matter with Congress?

"From one end of the country to the other, the cry is growing. *What's* the matter with Congress? What *is* the matter?

"It is no longer only 'big business' that is demanding the answer. The general public—the working man, the housewife, the salesman and the clerk, all are beginning to realize that something is *wrong.*

"The whisper is going the rounds that 'bad times are coming.' No one knows why, nor how, nor when—but what's the matter with Congress? Something's wrong. Watch out.

"That's the sort of thing that breeds panic. Every analyst knows that there is no reason for panic or distress—economically. The country is sound. Money is plentiful. Business is good.

"But Congress is greasing the skids. A couple more 'bonehead plays' will serve to set the nation on the toboggan. Congress must know it—but Congress doesn't seem to care.

"*That's* what's wrong with Congress. It doesn't care what happens to the country as a whole. It 'hasn't time.' 'Our representatives' are too much wrapped up in serving 'their' constituents to serve the country's welfare.

"Too much sectionalism; not enough Americanism—*that's* what's wrong."

Said Mr. Walsh, in part:

"Mr. President, intolerance is of many brands. The public is aware of many of these brands. Most attacks of intolerance are based upon ignorance and address themselves to the ignorant. The attacks of intolerance disclosed in these news items (a news story from the Baltimore *Sun* of May 27 was also cited) are not based on ignorance, for they emanate from experienced and educated 'leaders of public opinion,' but upon deliberate ill will and misrepresentation, because of a revengeful purpose.....

"For some time past it has been the vogue in certain circles to spread propaganda of this poisonous type for the purpose of discrediting Congress and particularly the Senate. It is not surprising that it has arrested the attention of the American people and is widely believed, for even some members of this body and others in high positions in the administration and captains of industry, like Gary, have denounced the present Congress, referring to it amidst prolonged applause at the sumptous banquets of the money changers as never being at such a low ebb......

"Put shortly, it is the voice of those who believe in an aristocracy of the vested interests; those who will accept democratic government only when, through control of political parties and public servants, their selfish ends are accomplished.

"Their conception of government is government for and by the few—the few who have power, either the power of wealth or the medium to make their dependents and employes political serfs. They are of that class who see no wrong in still seeking to control the votes of their servants, agents and employes as they did in earlier days; no wrong in public servants taking money directly or indirectly provided the bribed officials serve them; no wrong in public officials serving them in office with a tacit understanding that after they have left office their services are to be rewarded by handsome retainers; no wrong in public officials receiving political aid when the object of the assistance rendered is to help them through the power of their public office to exploit the people. To their minds, the public servant is a moron, who is poor and without prestige if he resists while in office the temptation to make a public career that will enable him in after life to make money while out of office. They are among those who believe that public servants who seek to form a free and privileged relationship between the Government and private exploiters of the Government are statesmen, while those who raise their voices against private exploitation of the people through governmental agencies are demagogues.....

"The philosophy of these propagandists is based on the theory that it is through legislation favorable to them alone that America can prosper. By innuendo, at least, these privilege seekers contend that, unless they get from the Government what they want, they will prevent the financial crumbs being gathered up by the millions whose very existence depends upon the investments of the wealthy class. Their conception of the functions of government is materialistic. They are without political ideals....

"Mr. President, it is little short of treason in a democracy to attempt to capture the sources of information and to use them to deceive the people so that they will vote for their undoing......

"The Senate has defects. Let us correct them with sympathetic hands. The Senate has imperfections. Let us purge it of them, and we will be a stronger bulwark than ever of our liberties. Let us stop abusing it because it is not as well controlled by political bosses and financial groups as formerly. In any event, those who sit here have been sent here by the American people. An indictment of the Senate is an indictment of the whole people....."

MACHINISTS' WAGES

The wage scale for the year 1924 has been settled after several weeks of negotiation between the Conference board acting for the machinists and the Chicago Manufacturers Committee. At the first meeting of these two bodies the Machinists Committee submitted a proposition of $1.00 per hour for machinists as the wage scale for 1924. This was promptly turned down by the Manufacturers Committee, and a counter proposal of the same scale for 1924 as was effective in 1923 was offered by the Employers Committee. This was rejected by the Machinists Committee and after a period of waiting a scale of 96¢ per hour for 1924 and $1.00 per hour for 1925—a two year agreement—was proposed by the Conference Board of Machinists. The result of this was an offer by the Manufacturers Committee of the following as the wage scale for 1924:

Machinists, 95¢ per hour; Tool and Die Makers, $1.06 per hour; Specialists, 68¢ per hour; Helpers, 58¢ per hour; Automatic Screw Machine Operators, 85¢ per hour; Automatic Tool Setters, $1.06 per hour. It was decided that this proposition be voted on May 15, 1924 by all members working in closed shops. It was also voted at the Executive Board Meeting of District No. 8 that this vote be considered a strike vote. The ballot was arranged that "yes" meant acceptance of the wage scale as proposed by the Manufacturers Committee, and "no" meant rejection and strike. A three fourths vote of all the members against the proposition was necessary to defeat the scale. The vote stood 418 to accept and 635 against acceptance. As the three-fourths vote necessary to defeat the proposition was not secured, the wage scale was adopted and the Conference Board advised to sign with the Manufacturers Committee, which was done. The scale for 1924 is, therefore, as above stated.

Continued from Page 11

. Never should it take more than an evening of his time.

re is a typical set of problems assigned as home work exercise group of foremen in a certain plant:

he transfer of an employee from one position to another times brings up questions as to whether certain transfers d be made. Consider the following points:

. Would you transfer a new employee from his first position, is request, if the department had reported that his work and ide were not satisfactory?

. Would you transfer a satisfactory employee in certain work e decides that she would like to try some other work to get inge? (This occurs more often in case of women.)

. Would you transfer to other work, at his request, an em-ee who feels that he will never be contented in a certain de-nent?"

ter several meetings students may show a tendency to lose est. One or two may be absent, and then drop out entirely. *e will always be the problem of maintaining the original llment.* However, the situation is not so bad as is imagined. ording to reports by twenty-eight representative firms giving man instruction to its foremen, out of a total of 2,374 fore- taking training in groups, 361 dropped out before the courses completed. This means that only fifteen per cent of the ents in these plants dropped out. Not a bad showing, by means!

he chief reason why men drop out is neglect to follow up two iore meetings. The student then says, "I missed the last couple neetings. Well, what's the use of continuing?" He does not it difficult to invent some excuse to stay away entirely.

ne remedy is to get after the absentee before he becomes nic. If he has missed one or two meetings special coaching nable him to catch up with the work might be arranged. An-r method is to hold a little sociable every month or so, to which foreman can invite his wife. Another is to give the men a ten examination every month or so, in which case he knows he must attend every meeting and follow up the instruction hfully. The men are asked to write down suggestions regard- management in their respective departments, in the light of it they have learned in the group.

f an advanced course is to be offered upon completion of the ular one the management should not wait until the last ses- of the first course to announce the subsequent one. It should announced a reasonable time before the completion of the rse and the announcement repeated at every meeting of the up during the remaining sessions.

FACTORY MANAGEMENT

'Factory Management" by Henry Post Dutton, B.E.E., has just n issued. It is a practical book containing 321 pages devoted the details of factory management such as financing, selling, duction control, manufacturing design, plant and equipment, e and motion studies, planning, personnel, wage payments, anization and executive control and a number of other im-rtant chapters. There are numerous tables, forms and charts voted to accounting, sales distribution, purchases and works incil procedure. The volume has been issued by Macmillan, l is a genuinely valuable addition to the business man's library.

Labor Banks

According to a Bulletin recently issued by the Employers Asso-ition of Kansas City there are now 26 labor banks in the United ites and others in process of formation. Organized labor ough these banks control $26,113,326 in capital stock, surplus d reserve. This does not include deposits which would pos-ly be made available.

The two largest banks in the group are the Engineer's Co-Oper-ve Bank at Cleveland, capital one million dollars with a sur-us and reserve of $15,547,402 and the Federation Trust Co., of w York City, operated under the auspices of the Central Labor uncil, capital one million dollars.

WHEN GOODS WON'T SELL

A Peculiar Situation and a Possible Remedy

By RAYMOND O. WEST

PROBABLY every manufacturer has, at one time or another, been confronted with the problem of "the store that can't sell the goods." In other words, he has found, perhaps here, perhaps there, that, while he readily succeeds in placing his wares in certain establishments, repeat orders are nil: the goods—good goods, too—simply won't come down off the shelves.

Too, this condition exists to varying degrees. In some instances, sales are not what, by every rule of the game, they ought to be. In others, sales drop off, apparently for no reason whatsoever, everything else, including price, competition, advertising and quality, remaining as was.

What is the answer?

There are, of course, several possible solutions to the problem, but the one with which I shall deal, and the one which I believe should be brought to manufacturers' attention, is this—

You have "dealer cooperation"—but what of the sales-people, the clerks?

Hundreds of thousands of dollars in sales are lost to manufacturers annually for want of this, which, for want of better expression, I term "counter cooperation." The man, or woman, behind the counter is, in the final analysis, the manufacturers' final representative—his actual sales agent, no less than that of the retailer-employer.

Let us take, for an example, the case of XXX cutlery. The manufacturer puts into this product the best of everything; he puts behind it an intensive and intelligently planned advertising, he obtains "dealer cooperation" of the best, installs window displays and other dealer helps, and—

The man behind the counter—the clerk—is not "sold" on the product. Or perhaps he is of the type who antagonizes the prospective customer. Very well, what is the result?

If the clerk is not "sold" he is unenthusiastic, his manner is indifferent, he does not really make any effort to *sell* XXX cutlery.

"'Don't care for this? Hmmm. Well, here's something else—very fine—been selling it for years—no better on the market—"

And the sale goes to YYY or ZZZ, and there you are.

Even more dangerous to the manufacturer who entrusts his products for sale to the retailer is the retailer's clerk who antagonizes the MMM prospect—who is too lazy, or too impudent, or too supercilious. Allow me to take a page from personal experience:

A week or so ago, Mrs. West was impressed by an advertisement in our local newspaper regarding a new washing "flake." The following day, having occasion to purchase washing materials, she stopped in at the corner grocery and asked for the particular brand in question.

"Just a moment, madam, I can't wait on more than one customer at once!," was the surprising retort she received from the young woman behind the counter.

Mrs. West, in common with a majority of other women, has a temper of her own. She walked out of the store. She swears she never will trade there again. And for some peculiar reason, she has lots all her original enthusiasm for the newly advertised brand of "flake" MM and has determined to stand by that to which she heretofore has been accustomed.

And, again, there you are.

It seems to me that there is a positive and growing menace to the manufacturer in the lax conduct of sales people in the retail stores. When all is said and done, the manufacturer is utterly dependent upon the retailer, and the retailer upon his sales people. The distressing difference is this, that the manufacturer has only his own product on sale, whereas the retailer has the products of uncounted manufacturers, and, if sales do not come in from one brand, need not worry so long as they come in through another.

In these days when markets are hard of winning and difficult of holding, the manufacturer must give some attention to this phase of selling. I venture to say that many a manufacturer would, in the long run, find it more profitable to NOT introduce his products into certain retail stores than to do so—and bear in return the brunt of ill will arising through lack of "counter cooperation."

Continued from Page 5

ately went to work to nominate Judge Kenyon who had been favored by the western progressives but whose prospects in the administration conference and in conservative ranks had not been good. This time Pennsylvania and New York, which had been helping the administration, bolted completely.

The orders to put Kenyon over had been issued without a conference of the leaders and the first Mr. Butler knew of the fiasco ahead was when he was called out of the convention and so informed.

There was nothing to do but to let the Vice-Presidential contest go to a ballot to see what the law of the land really was. Lowden, despite his repeated declinations, led on that ballot. The leaders of the big delegations in the convention wanted Lowden as badly as anybody but they were convinced that the former Illinois governor could neither be pushed nor shoved into the nomination and that a letter of declination was ready to be read to the convention.

Four years ago Lowden was asking the convention to nominate him. This time the convention was begging Lowden to accept but there was no indication that he would do so. Word went down the line, therefore, to put Burton over on the second ballot. It came from the old guard leaders with the acquiescence of Mr. Butler, who realized that Kenyon stood no chance in the convention. They even went so far as to congratulate Mr. Burton and to advise him that he could remain in the hall while the nomination was made but must not make a speech of acceptance at that time.

The delegates, who were now suspicious of all orders, having been led up hill and down dale on the Borah and Kenyon expeditions, looked around for a way out. There was only one—Lowden, whom the convention wanted anyhow. They simply bolted en masse and before the second ballot ended the big delegations and even Illinois, which had adhered to Mr. Lowden's personal wishes to the end, changed their votes and a nomination by acclamation followed. The first attempt of the old guard outfit to control the convention was knocked into a cocked hat. Burton had been humiliated in a way that took him completely out of the running and every administration candidate in sight, except Herbert Hoover, who, not voted for on the first two ballots, had suffered the same fate. *Charles G. Dawes alone was unaffected because he had received only the votes of real friends and had not been supported either by the administration or old guard forces.* That was the situation when Lowden finally declined in a telegram to the convention which was accepted with regret and with sincere applause for his manly stand. He had resisted the draft as he said he would.

After a recess of two hours, the administration leaders returned to the convention resolved to nominate Hoover, to whom both New York and Pennsylvania were opposed. There were strong indications that those who had supported Dawes as a protest against the leadership would continue to do so and that they would gain recruits. New York and Pennsylvania caucused and decided to help Dawes. And that turned the tide. The nomination followed inevitably.

Continued from Page 6

er are often responsible for the frame of mind which is con-
ve to accidents.

his point is illustrated by the experience of a representative ne of the Standard Oil Companies, which recently came to ttention. Like most other safety engineers this man found a number of their oldest and best employees simply would ake the safety work of the company seriously. When every- else failed, he tried this: he would get into a conversation the workman or foreman who refused to observe safety rules practices and would say, "John, what do you think of this pany, anyhow?" In nine cases out of ten, John would say couldn't find a better place to work anywhere in the world would then go on to enumerate all the things he liked about ompany. When he was through, the safety engineer would say, ll, John, now that you agree with me that the company is giv- its men a square deal, do you think you are giving the company uare deal when you persist in dangerous practices which may e an accident to you or to the men around you and that this dent in addition to the injury to yourself and your fellow- kers might cost the company thousands of dollars?"

his representative said that invariably the worker's response

I must say I have never thought of it that way and you can k on it that from now on I am going to play the game squarely the company and there will be no accidents around here if n help it."

hat representative's work represents probably the highest of accident prevention through education and there is room a great deal of such work in every one of our great industries. afety education in the major sense probably means that de- pment of oneself so that he is constantly, automatically, sub- sciously on guard against accident. Many years of personal ty in the character of the work done in a shop, or the traffic n the highways, has subordinated or practically eliminated element of caution in every human being. Going back to the ly days of the Republic, you recall how everyone was in danger m Indians and wild animals, and therefore everyone was al- ys on guard and any unusual or unexpected sound, like a rustl- twig or a cracking stick, brought one to immediate attention, king for possible danger. Today, every industrial activity is omplished through the aid of high speed and dangerous machin- ; a very large percentage of our population lives at great rela- heights from the ground; highways, even in the otherwise iet, secluded country, are ocupied by heavy, high-speed traffic t makes them more dangerous than the usual right of way upied by a railway. The dangers of the early days of the public are multiplied a thousand-fold on every hand, and we st train ourselves to be constantly on the watch wherever we are, a power-plant, factory, on the highways, or traveling by boat train.

The safety movement of the country has resulted in the develop- nt of a new profession in our industrial life, to which, at the ment, there are probably no less than five thousand men giving ir entire time as a life profession. I have seen large gatherings these men, who, collectively, seemed to represent a combination a lawyer, a doctor, and a minister, such has been the result of practical constructive interest in every phase of human wel- re. These men should be considered in the highest sense as ele- nts of economy and efficiency in our industrial and commercial e, for in every instance organized safety effort, both in plant uipment and education, pays and pays handsomely.

Railroads and Radio

Practical utilization of the radio in railroad operation is under rious consideration by many of the nation's largest railroads.

Study of the question is proceeding along four lines: the use receiving sets to obtain news and entertainment on through assenger trains; the use of radio to form a closer contact be- een officers and men; the use of sending and receiving apparatus both freight and passenger trains, and the development of a ethod of train dispatching in emergencies when wires are down.

The most important of these, probably, is broadcasting to han- e traffic.

Manganese Steel Castings

Continued from Page 7

They stated their purpose in a preamble, marvelous in its directness and simplicity, occupying less than five lines upon the printed page.

In seven short articles they instituted the administrative machinery of their government, provided for the organization of its branches and departments, and then grudgingly, as befitted free men who had been burnt in the fires of bitter exjerience, reluctantly, and with every precaution that knowledge could dictate or wisdom foresee, granted to their government and their public servants such powers, and only such powers, as were absolutely essential to its maintenance, administration and defense.

They expressly declared themselves, and not their government, the source of all power. They made it their servant, so far as they could, no excuse for misunderstanding of a servant's place in the national household.

See how careful they were.

Knowing standing armies to be dangerous, they forbade them. They provided for trial by jury in the place where offense was committed. They strictly limited and regulated the powers of taxation. They defined treason in exact terms, and it is worth noting, in this age, that expressing one's candid opinion of either the Constitution or the laws is not one of the elements of that offense.

With equal caution, they provided that the public servants, the officers of their government, daring to infringe on the liberties of the people by either malfeasance or misfeasance in office, or committing high crimes and misdemeanors, should be subject to impeachment at the hands of that department of the government coming most recently from the people, and, as if this were not enough, to indictment, trial and punishment as common criminals.

Finally, appreciating with an understanding rare among statesmen, that to themselves, either as individuals or collectively, had not been delegated all the wisdom of the ages, and meaning their great work to endure for all time, they gave it that flexibility which alone made possible its adoption by their countrymen and insures its continued acceptance by their descendants, by making it extremely easy of amendment.

It would seem, at first contemplation of their work, that they had amply provided against interference with their liberties.

Every "shalt not" in the document is directed, not at the people for whose protection it was adopted, not at any individual, private or public, except so far as individual action should encroach on national liberty, but exclusively at the government itself, or at its departments, agencies and officers, and from that time to this, the same thing is true of every amendment to the instrument, except one.

Could caution, born of the agonies of a people, nurtured in the blood and fire of persecution, tyranny and revolution, go further?

Yet this work almost perished at its very birth.

In mortal fear for their freedom, in terror scarcely understandable to a generation over a century removed from the cannon of the Revolution, the American people rose almost as one man and denounced the whole scheme of governments as proposed for their ratification—this, not because of the character of the organization established, but because the instrument establishing it contained too few restrictions, too little limitation, on the powers granted.

State after state arose in anger, and adoption of the Constitution was executed only after Washington and Hamilton, spokesmen for the convention, had again and again pointed out the provision for amendment, the reservation to the people of continuing power to modify the powers granted, and at will to limit still further the possibilities for abuse of power or encroachment on their freedom.

With this understanding, nation-wide and acted on immediately, the Constitution became the fundamental law, not of, but for, our government.

Observe now, and with reference to consideration of current conditions, the action of our forefathers with respect to the power of amendment.

Co-incident with their ratification of the original charter, they proposed and adopted ten amendments, commonly known as the Bill of Rights.

In these, deliberately, and with the firm intention of further tying the hands of their servant, the government, they made of record, and enacted into the fundamental law, further restrictions on its power to trespass on their rights.

They provided for freedom of religion, a privilege which churches of all ages and nations have shown scant inclination to grant to others. They ordained freedom of speech and of the press. They set forth their right peaceably to assemble and to discuss, and to petition their servant, the government, for redress of their grievances. They asserted their right to bear arms. They forbade unreasonable searches and seizures. They made indictment precede trial, and they spoke emphatically, and in no uncertain terms, against double jeopardy. They further defined the right of trial by jury, and extended it to civil controversies. They expressly forbade excessive bail, excessive fines, and cruel and unusual punishments. Finally, they stipulated that rights granted their government should not deny and impair others retained by the people, and reenforced his by the flat declaration that they reserved to themselves, the source of all power, every power not delegated by themselves to the United States, nor by the Constitution prohibited to the States.

These enactments, in themselves the very essence of caution, the facts of our history have justified again and again. They are the very foundation stone of our liberty, and it is well to remind those who today would violate them at will, that they are still in full force and effect.

Every subsequent modification of our Constitution, except one, every Amendment except the Eighteenth, has been drawn in the light of the experience of our fathers, has been adopted to insure for their posterity the liberty they sought for themselves in the flames of a hundred battlefields, has been another chain placed, not on the rights of mankind, but on abuses, misdeeds and omissions of the government to which were granted certain limited and necessary administrative powers.

The eleventh freed the several states from suits by individuals. The twelfth regulated the details of presidential elections. The thirteenth took from government the power to enslave except as punishment for crime. The fourteenth and fifteenth, nullified to this day not only by individuals but by sovereign states, reasserted the rights of citizenship and sought to punish any state which should abridge them. The sixteenth, administrative like the twelfth, regulated the power to tax direct. The seventeenth provided for the popular election of senators. The nineteenth extended to both sexes the privileges of citizenship.

In none of these, diverse as are the subjects involved from time to time, is there one discordant note, one word repugnant to the purpose of the fathers to make their government their servant and to reserve to themselves, as free men, the rights they tore by force from the hands of tyrants.

Contrary to the popular impression, the Constitution is extremely easy of amendment.

In the life of a nation, a century is but a single day.

In the brief period of our national existence, less than a day and a half as the life of a nation is measured, constitutional amendments have been adopted nineteen times, and they undoubtedly will be, again and again, hereafter.

In this fact, and in this possibility, clearly foreseen by the makers, lies the strength of the instrument, and its only chance permanently to endure.

At no time when the public opinion of a respectably large minority of our people demanded a change in the Constitution, has the change failed of peaceful and orderly enactment under the forms of law.

Every generation has worked its will upon it. Every generation, in that indifference to public questions which makes disuse of the individual franchise habitual with our voters, has without protest suffered organized minorities to amend the fundamental law.

Every generation to come can and may do the same thing.

To deny this, as in their desperation the supporters of the Eighteenth Amendment are doing today, as the *Toledo Times* did editorially last week, is to ignore all the experience of the ages. It is to say that dead hands can rule the living, that paper chains forged in the twentieth century can bind the hearts and minds of generations yet unborn.

Continued from Page 8

ariffs are issued by the Canadian carriers for the teaming serv- and are filed with the Regulating Commissions as terminal rges. The rates named in the tariffs apply only in the areas ›raced in what is termed cartage limits.

n the territory west of Port Arthur cartage tariffs are not ed by the carriers, although in the principal distributing cen- a similar service is provided by the large teaming companies rating in connection with the railways, with the exception that teaming companies themselves issue rate schedules.

Ve have not as yet made any experiments in the way of replac- our existing way freight services by the utilization of the tor truck operating on highways. We have, however, been ching with considerable interest the development along these ›s made by private individuals in conjunction with the move- nt of supplies for limited distances to and from manufacturing nts and by private trucking concerns. We are also utilizing motor truck in some of our larger terminals for the transfer L. C. L. freight to and from connections and between freight ·ds. This practice has so far proved both satisfactory and ›nomical.

In addition to this, we have been experimenting with various ›es of self-propelled rail unit cars, largely for passenger and ggage, or express services, to meet one or other of the following ıditions:

(1) To give a frequent passeenger service on sparsely settled branch lines, or parts of main line adjacent to market towns or junction points.
(2) To connect junction points, on important main lines, with the town or small city situated within a few miles of the main line.
(3) To give a group of towns, situated on a main line or important branch lines, a frequent connecting service over and above through main line trains.
(4) To connect small summer resorts, golf clubs, etc., to branch line or through main line service.
(5) To handle milk of a limited amount to a distributing or connecting point.
(6) To provide connections to small suburbs.

Amongst the various types of self-propelled rail unit cars has ·en the so-called motor car, but there is still much to be done ·fore we will be entirely satisfied with our efforts in this con- :ction.

In considering the question of the adjustment of motor vehicles the functions of a common carrier, a great many questions ›me to mind, amongst which might be mentioned:

(1) The attitude of the public which, so far as the handling freight is concerned, reeally resolves itself into a question of ıe service rendered and the cost of the service, together with e responsibility of the carrier for loss and damage. From the andpoint of the passenger service, however, conditions are some- hat different, as the degree of personal comfort and smooth ding qualities of the steam and electric trains cannot be ordi- ırily equalled by the motor passenger coach, unless the highway improved, and this is a factor which has to be taken into ›nsideration.

(2) The second query is in connection with the construction nd maintenance of highways. It is necessary to have specially uilt and adequately maintained highways to properly accommo- ate any large development in the use of the motor truck and a ırge body of opinion rather holds the view that the motor truck estroys public highways to a large extent without a correspond- ıg contribution towards their maintenance. Unquestionably, any ubstantial increase in the use of the motor truck on highways 'ould necessitate the design and maintenance of those highways › adequately meet the traffic requirements.

(3) The third point is the extent to which the motor vehicle s a transportation facility should be subjected to public regula- ion. I think there can be no question that regulation of traffic nd of size, weight and speed of motor vehicles by public bodies, ›aving control, should be as uniform as possible and that regula- ion of common carrier operations of motor vehicles, including ate regulation, should be handled by the same public bodies

SOUTH AFRICA "LISTENING IN"

Request for Apparatus Among Week's Current Demands

SOUTH AFRICA, evidently, has joined the ranks of radio fans, for this week's foreign trade openings include a request from a South African dealer for radio apparatus and parts.

Ireland, true to her ancient insignia, the harp, seeks musical instruments and band novelties. Portugal is in the market for electrical machines and supplies and Australia for motors.

Fifty thousand glass jars (½ lb.) for butter are among other current foreign needs, confidential information concerning which may be obtained by any manufacturer who will write MANUFACTURERS NEWS giving the serial number of the item concerning which information is desired. This week's complete list follows:

- AUSTRALIA—
  - 10600: Motors, 200 to 400 volts, single-phase.
- AUSTRIA—
  - 10551: Drugs. Cosmetics and patent preparations. Pharmaceutical preparations.
  - 10613: Crystal and pressed glass dishes.
  - 10587: Furs, all kinds.
  - 10609: Fittings for laboratories. Scientific instruments for physicians and chemists.
  - 10613: Glass vase and bowl.
  - 10585: Hosiery, medium and high-grade, for men and women.
  - 10604: Surgical rubber goods.
- BRAZIL—
  - 10568: Coal-cleaning and sizing and coal-briquetting machinery.
- CANADA—
  - 10584: Cotton goods. Furs, raw. Silk goods.
- CHILE—
  - 10594: Plows. Road grader, small, of strong and durable construction. Stumppulling machinery.
- COLOMBIA—
  - 10593: Capping and caling machinery for butter glasses. Dairy machinery for making butter and cheese. Glass jars, 50,000 for butter, one-half pound.
- DENMARK—
  - 10570: Machinery for making steel table knives and other knives.
- ENGLAND—
  - 10565: Alfalfa meal and prepared oyster shells for feedstuffs.
  - 10545: Barrel shooks, new or second-hand, to hold about 375 pounds.
  - 10558: Canned goods. Fruits, dried.
- EGYPT—
  - 10560: Canned fruits Dried fruits. Fruits, fresh, California.
  - 10590: Sheetings, grey cotton.
- FRANCE—
  - 10563: Canned ham, best quality.
  - 10569: Labeling machines, automatic, for labeling wine bottles, etc.
- GERMANY—
  - 10572: Aluminum castings.
  - 10546: Barrel staves, oak.
  - 10562: Canned corned beef. Condensed milk. Fruits, dried. Lard. Fruits, California, preserved. Flour. Bacon. Wheat.
  - 10572: Machinery tools, especially gear wheel-cutting machines. Tires, automobile.
  - 10610: Motion picture films, all kinds.
  - 10542: Walnut and poplar logs.
- GREECE—
  - 10567: Bakery equipment, complete, for daily output of 50,000 loaves of 1.28 kilos.
  - 10559: Flour maturing and bleaching system.
- IRELAND—
  - 10595: Coach builders' supplies, including axles and springs. Carriage lamps, handle grips, and door handles. Leather substitutes for carriage cushions.
  - 10611: Musical instruments. Band novelties.
- ITALY—
  - 10550: Chemicals, heavy. Medicines, best quality.
  - 10543: Dogwood and persimmon shuttle blocks.
  - 10603: Soles, crepe rubber. Uncut crepe sheets.
  - 10608: Tires for automobiles, motorcycles, and bicycles.
  - 10607: Sundries and specialties.
- LITHUANIA—
  - 10577: Steel bars, round, variety of sizes.
- NETHERLANDS—
  - 10549: Aluminum and brass for die sinking. Brass tubings and bars. Lacquer and thinners for varnishing brass articles.
- NORWAY—
  - 10606: Belting, conveyor, 155 meters long and one meter wide.
- PALESTINE—
  - 10558: Drill, shoe linings.
- PARAGUAY—
  - 10586: Haberdashery, including garters, suspenders, neckwear, handkerchiefs, and collars.
- PORTUGAL—
  - 10601: Electrical machines and supplies
- SOUTH AFRICA—
  - 10552: Chlorine, liquid, in steel cylinders.
  - 10614: Glass jars, large range of sizes, for displaying confectionery. Sausage casings.
  - 10599: Meat mincers and slicers.
  - 10597: Radio apparatus and parts.
- SWEDEN—
  - 10583: Cotton, absorbent.
  - 10566: Drills. Insulating material for steam and heat conduits. Lathes. Machine tools, especially for shipbuilding industry. Machines for cutting and grinding. Small tools. Welding and cutting apparatus, oxyacetaline and electric.
- SWITZERLAND—
  - 10612: Mah Jongg sets, cheap grade.
- WEST AFRICA—
  - 10580: Canned salmon, cheap. Oil. Sugar, cube.

Science in the Use of Nails

In making a packing case the nailer must use his own head as well as the nail's, declares John F. Keeley, packing expert of the Department of Commerce. The proper nailing of boxes demands the use of the right kind of nails, the right size and the right number. The size and thickness of nails are determined by species of wood and thickness of boards. The woods commonly used for box-making purposes have been divided by the Forests Products Laboratory into four classes according to their strength and their ability to take and hold nails, with white pine leading group one, southern yellow pine leading group 2 and red gum leading group 3.

Air Gun for Plaster

According to the Washington (D. C.) Times, details of the construction and use of the new mechanical plastering device, which is said to do in one day the work usually turned out by eight men, are now available. The machine is the invention of Albert Oliver, of New York, who twenty-one years ago introduced to the building trades the Clinton system of fire-proof building. Yasou Matsui, an architect, has placed an order for mechanical plasterers on behalf of the Japanese government, which is interested in their use in connection with reconstruction. The machine traps mortar in batches of three pounds, forced from the box by a forty-pound air pressure.

RAVINIA SEASON OPENS

Current Attractions in Chicago Theaters

By THE SHOWMAN

has been my experience that the popu- ar idea that the visiting buyer or busi- man is a personage eager solely for at" entertainment and unappreciative he finer things of the theater is a fal- . Which is by way of prelude to the ouncement that *Ravinia* opens again (Saturday) evening.

AVINIA, as you may or may not know, ie name of Chicago's summer "grand a suburb," situated some thirty miles h of town. It consists of spacious nds, centered in which is an open ilion, capable of seating some thousands pectators. There, throughout the sum- months, is offered practically every- g worth while in grand opera.

Cavaleria Rusticana" and "*Pagliacci*" stitute the double bill opening the sea- . Tomorrow (Sunday) evening will ess "La Traviata." Monday evenings ughout the season are "*concert nights.*"

asily reached from the city by motor rail, *Ravinia* is an excellent answer to so-often perplexing problem of "where ll I take him"—*him* being that impor- t customer or visitor. By motor, the te is straight north on Sheridan Road; rail, either on the Chicago & North stern or the Chicago, North Shore & Mil- ukee Electric.

THE AMBER FLUID, a "crook" melo- ma, opens tomorrow (Sunday) evening the Princess Theater. Arthur E. Lamb he author. The play, I understand, has n well received elsewhere and is suffi- ntly intriguing to assure an exciting ning. Miss Elaine Gholson (I am un- le to place her in my memory of stars o hitherto have shone here) is heralded a leading part in the cast. Miss Ghol- evidently has the confidence of Mr. mb, however, as I hear that he plans to roduce through her, at some matinee rformance either in the Princess or The ayhouse, another of his plays—"*Mary es Visiting.*"

Speaking of "crook" plays, LEAH ESCHNA, the daddy, if not the grand- ddy (or should I say grandmother?) of em all, met with so favorable a reception the Great Northern that its engagement, iginally two weeks only, was extended rough this week as well. With a cast including William Faversham, Arnold Daly, Helen Gahagan, Jose Ruben, Harry Mestayer and Arnold Korff, the extension was foreseen by many at the time the play opened.

THE DELUGE, a notable play by Henning Berger, twice staged in New York of recent years and well known in Europe, opened at at the Cort Theater this week, and indications are that it will have considerable success. Miss Emelie Polini, an English actress, plays the role of "Sadie"—a woman of the streets. The production passes as a character study (as, indeed, it is) but serves more toward provoking thought than amusement.

THE THREE OF US, a comedy by Miss Rachel Crothers, which was last seen here in 1907 at the Garrick, has been revived and returns to "the boards" at The Playhouse tomorrow (Sunday). Maude Hanaford, a star of repute, heads the cast. The play is of that nature that runs the scale of emotions from laughter to (in the language of the press agent) tears.

"*Tarnish*" is due at The Playhouse August 17; "*Meet the Wife!*" at Cohan's Grand August 24. Also, on August 24, "*In the Next Room*" will make its appearance at the Princess. "*Runnin' Wild,*" a Negro production, has been tentatively booked for the Selwyn August 10.

RAILROAD "EXCURSION RATES" for out-of-town theater parties desirous of attending "*Abie's Irish Rose,*" now in its twenty-sixth week at the Studebaker Theater, are being arranged for by Frank A. P. Gazzolo, manager of the theater. The plan is to offer special round-trip rates to parties of fifty or more from points within a radius of three hundred miles of Chicago. The plan has never before been tried here, although it was worked successfully by the New York Hippodrome.

ABIE'S IRISH ROSE is the first Chicago play to announce reduced prices for the summer. Main floor seats have been lowered to $2. Monday to Friday evenings inclusive; Wednesday and Saturday matinees, to $1.50; Saturday and Sunday evenings, to $2.50.

Chicago Conventions

Among the conventions of interest scheduled to held in Chicago are: June 23-27, American stitute of Electrical Engineers, Edgewater Beach tel; June 23-28, Summer Merchants Week, 10 LaSalle st.; June 23-July 19, Furniture Exhibi- n, Furniture Mart and 1414 S. Wabash av.; ne 24-25, Western Cigar Box Manufacturers' sociation, Drake Hotel; June 24-27, National tail Tea & Coffee Merchants' Association.

Illinois Bell Telephone Company

The Board of Directors of the Illinois Bell Telephone Company has approved an expenditure of $2,198,635 for new plant in the City of Chicago, and $1,309,328 for Illinois outside of Chicago, making a total of $3,507,963. The total approved for this year is $9,665,023. A dividend of $2 per share has been declared, payable June 30 to stockholders of record June 28.

How to Insure Sales for Your Product!

The chief asset of any business is the demand for its product. As long as that demand continues, the business is on a sure foundation. But let that demand subside, and every other asset of the business is in danger of becoming a liability.

IN times of prosperity and a rising market there is a general demand for the products of industry that comes to be accepted as a matter of course. It is seldom listed among the assets of the business—it is simply assumed that it will always be there.

But, overnight, conditions may change—as they have done before—and the matter-of-course demand becomes conspicuous by its absence. The business, once strong and flourishing, is suddenly found to be in a very tight place. The demand had not been insured—and yet the entire business depended upon its continuance.

The modern, economical way to insure the market for any reliable product is by Advertising to the public which consumes it. Advertising creates a steadily increasing number of customers who desire the product, and ask for it by name.

Changes in business conditions have little effect on a steady consumer demand for trade-marked articles of common use. The dealer may carry a lighter stock, and for a short time the demand through the jobber may seem curtailed; but just as sure as customers are calling on the dealer for the product, he is sure to supply it, and orders soon begin to flow in to make up for the temporary curtailment. The total consumption continues about the same.

Any manufacturer who has an article for popular consumption that can be trade-marked has the opportunity to insure his consumer market and retail sales by means of Advertising.

During the present business condition the manufacturers who have insured their demand by Advertising are in a far better position—in every way—than those who have trusted to the current demand that was not of their creating.

[Published by MANUFACTURERS NEWS in co-operation with the American Association of Advertising Agencies]

Continued from Page 21

which now control the operations of rail carriers and that comparable features should be similarly treated.

(4) In any possible substitution of motor vehicles for railway requirements, the question naturally arises as to who shall operate the motor vehicle, that is to say, should the operation be done by the railway organization or by a separate organization? Opinions appear to differ on this point and a good deal may be said for and against. Undoubtedly, there are certain conditions under which it would be more profitable for the railway to operate the motor vehicles itself. On the other hand, there are conditions under which it would be undoubtedly more advantageous to have the motor vehicle operation handled by an outside concern.

One thing is certain, however—if motor transport is to be a substantial factor, it must be placed upon a sound financial basis, so as to ensure to the public continuity and reliability of service. Whether this can best be done as a department of the railways, or by a separate and individual organization, working in close conjunction with the railways, I am not prepared to say.

If any discussion such as this is to be constructive in character, it is essential that conclusions should be thrown into bold relief for the purpose of focusing subsequent argument. Therefore I venture to place before you the following summary of the subject of this paper in the hope that it may furnish a fruitful field for constructive argument.

1. Motor propelled vehicles promise to become economical adjuncts to the services performed by railway companies, both on their own lines and on the highways, and an important and useful field exists for further investigation in this direction.

2. The attitude of the railway companies toward motor transportation as it is generally and broadly known should not be hostile, but an effort should be made to harmonize both with the object of providing to the community a constantly improving transportation service.

3. The constantly increasing volume and weight of motor vehicles traveling upon the highways demands a roadbed of more permanent character and the provision of some form of assessment in some measure proportionate to the use made of the highway.

4. Since motor transport is likely to play a constantly increasing part in the welfare and economic life of the community, companies engaged in the industry will sooner or later have to contemplate the same degree of regulation with respect to services and charges as is now imposed upon other common carriers.

Labor Party of Illinois

A new labor party was formed by the radicals of Illinois. Its official name is the Labor Party of Illinois. It was formed principally by members of the United Mine Workers of America. Duncan McDonald was elected secretary of the new organization and was named to represent it at the nominating convention of the Farmer-Labor movement at St. Paul, June 17.

Work Shop of America

There will be by 1950 a population of 12,940,000 in the territory embracing Chicago and the northern halves of Illinois and Indiana, northwest Ohio, southern Michigan and southeastern Wisconsin, known as "the workshop of America," according to estimates of the power survey committee of the Great Lakes section of the National Electric Light association. This district in 1920 had 8,600,000 people.

A. F. L. Membership

The National Association of Manufacturers reports that there has been a recent decrease in membership of the American Federation of Labor, amounting to almost ten per cent, and that at the present time the total membership of all labor organizations represents approximately one-fifth of the total eligible working population of the country. Further, that strikes in the country mean a loss of five hundred million dollars a year to the people.

COOLIDGE AND DAWES

OLIDGE AND DAWES will sound good to many people.

these days of time-serving, trimming, ldling political opportunists, it is re- ing to contemplate the candidates for ident and Vice-President on the Re- ican ticket.

olidge and Dawes may be politicians. are not opportunists in the political . They both have courage. They both —we hesitate to use the plain Anglo- n word, but you know what we mean Latin equivalent is viscera. They have e and determination.

Mr. Coolidge had been a political ortunist he would have signed the bonus Instead he had the courage to veto ecause he feared that ultimately bil- s of dollars of bonus money would be ezed out of a tax-ridden people. If he been a political opportunist he would have held out for the Mellon tax plan.

s for Mr. Dawes and his "up-side-down " all know what he has accomplished.

cannot point to a single American en who has done more for his country, has given so much time, labor, men- ty and money unselfishly for the good he United States, Europe and humanity.

OOLIDGE AND DAWES. They are of action. They think of others than nselves.

Trade With Latin-America in 1924

he trade of the United States with Latin rica for the first quarter of 1924 amounted to 7,949,891, a gain of about ten million dollars the first three months, and approximately ty million more than the last three months of rter of 1923, according to an analysis by Latin American Division of the Department of merce. Our imports from Latin America $305,659,540, and our exports to that region $172,290,351. Imports were some two mil- dollars below the first quarter, but about ty million dollars above the total for the last 3; exports were about twelve million higher during the first quarter but approximately million less than for the last quarter of 1923.

total trade of the United States with Latin erica for April, 1924, amounted to $167,338.- , a decrease of $6,980,706 from the total for il, 1923, which was $174,319,058. Our imports n Latin America in April were $95,744,885, nst $113,519,029 for April, 1923. Our exports atin America were $71,593,467 in April, com- ed with $60,800,029 for the corresponding th a year ago.

Eight Hour Day Expensive

ccording to Judge Gary of the United States el Corporation changing from a twelve hour to an eight hour shift is costing the steel cor- ation about $35,000,000 a year and adding 10 cent to the cost of operation. At the annual eting of the stock holders recently he said no could hardly say just what the precise results uld be. The officials of the company for years e in favor of abolishing the twelve hour day, because, he said, it was an evil, or that the rkmen desired it, but there appeared to be a wing public sentiment against its continuance. lge Gary seemed pleased to state that they had omplished two things, one in which they had isfied President Harding before his death and other that they had met public sentiment.

Thirty Years' Cooperative Marketing

Widespread interest in the "California plan" of cooperative marketing makes especially timely Department Bulletin 1237, *Organization and Development of a Cooperative Citrus-Fruit Marketing Agency*, just issued by the United States Department of Agriculture. In 1891, when shipments were a little more than 4,000 cars, there was an apparent over-production of California citrus fruit. Thirty years later a crop totalling more than 56,000 cars was marketed successfully. Bulletin 1237 describes the growth of the system of cooperative marketing that since 1893 has taken a leading part in the development of the California citrus industry. It outlines, also, the steps by which local associations and district exchanges became federated in the California Fruit Growers Exchange. A brief historical account is presented of the California citrus industry since the introduction of orange trees by the Franciscan monks in 1769. The conditions causing the practical bankruptcy of the industry in the early nineties, and the unfortunate alliance of the exchange with commercial shippers in 1903-04 are other topics discussed in the historical section of the bulletin.

Adopt Reduction in Tank Sizes

Action for the elimination of waste in the steel tank industry taken by Eastern manufacturers was reviewed and, with some modifications, adopted at a meeting of manufacturers, distributors and representatives of consumers held in the Drake Hotel, Chicago, last week, under the auspices of the Division of Simplified Practice, Department of Commerce. The groups of products considered were hot water, gasoline and fuel oil, cold water storage tanks, also hydro-pneumatic tanks for isolated water systems. Fourteen sizes of hot water tanks were indorsed as the simplified line which will become effective January 1, 1925, when acceptances have been received from 80 per cent of the interests concerned.

New Building for Barrett-Cravens

The Barrett-Cravens Company (Chicago) announces plans to double its present capacity by building four additional stories to its factory. When completed, according to E. J. Heimer, secretary, the plant will be the largest in the world devoted to manufacture of life-trucks and portable elevators.

New Grinder by Hisey-Wolf

A new "midget" 6-inch electric two-wheel bench grinder by The Hisey-Wolf Machine Compang (Cincinnati) is described in Bulletin No. 1305-A, issued by the company. The grinder is equipped with a thermostatic safety motor switch, and adaptable to Hisey patented wheel guards.

New Link-Belt Catalogues

The Link-Belt Company (Chicago) has issued three new catalogues—*Portable Loader Book No. 650*, a forty page book covering the complete line of Link-Belt industrial loaders; *Electric Hoist Book No. 580*, a catalogue equal in size to No. 650, and *Locomotive Crane Book No. 670* covering both Link-Belt crawler and locomotive cranes.

Chicago & Alton Service Changed

Roy A. Pearce, general passenger agent for the Chicago & Alton Railroad, announces that "*The Hummer*," leaving Chicago heretofore for Kansas City at 6 p.m., standard time, will leave in future at 8 p.m., arriving at 8:15 a.m. and stopping only at Bloomington and Springfield, Ill., and Mexico. Mo.

Bull-Insular Sailings

The Bull-Insular Line, Inc., announces the sailing, on its regular weekly Porto Rico service, of the *SS. Millinocket* from Pier 27, Brooklyn, on June 28.

SYSTEMS OF WAGE PAYMENT

The National Industrial Conference Board's study of Syste of Wage Payment in manufacturing plants which is nearing co pletion is bringing to light some interesting facts in connecti with the experience with various features of the many systems use.

A preliminary questionnaire to ascertain in general how extensively the several systems were in use was answered by 1,040 plants employing about 770,000 wage earners. These plants represented a very wide range of industrial activity as well as all manufacturing sections in the country and it is believed that the information so generously provided by more than a thousand establishments represents a fair cross-section of American industry. The numbers and proportion of wage earners in the plants covered, operating under the various systems, is shown in the following table. It is of interest to note that while wage earners paid on a straight time basis are still in the majority, as would be expected, the combined number under all incentive systems is not far behind. Piece work is apparently preferred to premium and bonus systems by a ratio of about five to one. The implication that these figures represent the exact ratio of use of the various systems is, of course, not intended. It is believed, however, that they give some indication of the relative use of the systems.

DISTRIBUTION OF WORKERS UNDER VARIOUS WAGE PAYMENT PLANS IN THE 1,040 MANUFACTURING PLANTS COVERED

	No. of Workers Affected		Per Cent of Total	
Time Work		431,539		56.14
Hourly Rate	407,413		53.00	
Day Rate	24,126		3.14	
Piece Work		281,342		36.60
Straight Piece Rate	210,328		27.36	
Group Piece Rate	19,091		2.48	
Piece Rate with Guaranteed Day Rate	46,010		5.98	
Differential Piece Rate	5,913		0.78	
Premium and Bonus		55,811		7.26
Halsey Premium	14,245		1.85	
Rowan Premium	308		0.04	
Task and Bonus	3,915		0.51	
Efficiency Bonus	7,742		1.01	
Department and Group Bonus	4,713		0.61	
Parkhurst Differential Bonus	1,296		0.17	
Bedaux System	8,024		1.04	
100% Premium	1,122		0.15	
Special Premium Systems	6,878		0.89	
Special Bonus Systems	6,665		0.87	
Standard Hour	903		0.12	
Total		768,692		100.00

AMERICAN FACTORY WAGES

According to a recent survey of wage earning made in England, the purchasing power of the wages of the American factory worker are far above the wages paid in any other country of the world. The British Ministry of Labor has made a computation of the amount of food which the wages of workers in different cities of the world will purchase. In the following table the purchasing power of wages in London is taken as 100, and the purchasing power of wages in other cities is shown as percentages of this figure. The table indicates that the worker in New York can buy more than twice as much food with his wages than can the worker in London, while the worker in Berlin or Vienna can buy only a little more than half as much with his daily wage as the worker in London, or only one-fourth as much as the worker in New York:

New York	217	Warsaw	85
Ottawa	180	Brussels	70
Amsterdam	103	Paris	68
London	100	Prague	67
Christiania	92	Madrid	61
Stockholm	87	Berlin	57
		Vienna	55

Minimum Wage Legislation in Canada

Minimum wage legislation has been passed in seven of the nine provinces of Canada, namely Alberta, British Columbia, Manitoba, Ontario, Saskatchewan, Quebec and Nova Scotia. In the latter two provinces, however, the acts have not yet been put into operation. All laws enacted apply almost exclusively to women and girls.

Continued from Page 14

s of pork and meat products, wheat and flour as well as miscel- ous manufactures.

ew Jersey, with a balanced budget of all kinds of manufac- d goods, stands fifth. The far west comes next with Califor- through which so much Pacific trade flows. Then the far th, Louisiana, is seventh because of its Latin-American trade vities. Another Great Lakes State, Michigan is eighth.

irginia, whose tobacco has been smoked in every country of world since Powhatan taught John Smith to use the pipe, is th. The products of Washington's woods and waters—lumber fish—help to put that State in tenth position.

It must be remembered," Dr. Klein pointed out, "that the new ords are in a very preliminary form. Staple agricultural prod- s of the Mississippi Valley for example are frequently shipped northern and eastern concentration points; they may change ds several times en route and lose their identity as to state of duction before reaching the seaboard. The same is true of ny manufactured articles, orders for which have been placed by board export houses." However, according to Director Klein, new figures are sufficiently comprehensive to be of particular nificance and value in a study of our export trade, a remark- le amount of which is shown to originate in the interior.

Eleventh position in the list goes to Ohio, widely known as a nufacturing State. Massachusetts, manufacturing textiles, boots d shoes, machinery, etc., is twelfth followed by Oregon. North rolina is fourteenth and Georgia fifteenth. Wisconsin and In- ana come sixteenth and seventeenth.

The value of the exports from the different States for the first three nths of 1924, as revealed by the new arrangements, are:

der	State From Which Shipped	Value of Exports
	New York	183,846,364
	Texas	147,255,543
	Pennsylvania	74,747,650
	Illinois	57,655,071
	New Jersey	57,277,768
	California	53,196,442
	Louisiana	52,875,782
	Michigan	46,585,997
	Virginia	44,321,813
	Washington	38,160,991
	Ohio	35,115,572
	Massachusetts	27,999,686
	Oregon	20,273,030
	North Carolina	19,312,109

Limitless

No other word applies adequately to the facilities of this organization to serve manufacturers who use wood in making or shipping their products.

In our Chicago yard of 45 acres are piled thousands upon thousands of feet of all kinds of crating lumber.

Your phone call will start your order towards your factory today.

Just as promptly can we furnish maple, oak and yellow pine flooring, heavy timbers, piling, or any wood you need in the production of your goods, in any size or amount.

In Chicago and suburbs a system of twenty branch yards, ably managed and adequately stocked, means quick deliveries and lower delivery costs.

Phone us, wire us, write us for anything any time. Insure your service to customers by having unlimited service for yourself.

Continued from Page 20

It is easy to amend, and to the constitutional lawyer, viewing the question in the light of jurisprudence in many lands and in all times, without prejudice and unmoved by the merits or demerits of a particular case, it seems clear that modification or repeal of an amendment may be affected just as easily, and by the same machinery that made possible its enactment.

Consciously or sub-consciously, the supporters of the eighteenth amendment understand and appreciate this, and it is because of this, and for no other reason, that in the desperation of their weakness before the bar of public opinion they pour upon any critic of their hobby, any expounder of the real relation of their policies to American liberty, the full measure of their vituperation and abuse, reserving for their friends and allies, the bootleggers, a milder expression of their wrath.

It is no answer to the view I hold, to say that because no amendment has ever been repealed, none ever will be. Amendments have modified the original document to enlarge or protect national rights, and we may be very certain that when any amendment is discovered by any considerable body of our people to be, not in furtherance of those rights, not in protection of the people against their government, as every amendment except the eighteenth has been, that amendment is going to be repealed.

That is what will happen to the eighteenth amendment, and that is what the lawyer leaders of the Anti-Saloon League, and their satellites, fear and are endeavoring to anticipate and prevent.

In the light of these facts, let us discuss the Eighteenth Amendment.

This is not a discussion of prohibition, with whose merits or demerits I am not at present concerned. I have not the temerity to elevate a detail of public policy, properly the subject of police regulation alone, to the dignity of a constitutional question. I am talking about the Constitution, and matters affecting it, to the exclusion of everything else.

I do not think it necessary, to those who know me, to say anything in explanation of my position.

But because the wires and mails are carrying these remarks of mine to the newspapers of a thousand cities and towns, because they will be printed in booklet form and distributed to mil to whom I am a stranger, because I know from the experie Doctor Nicholas Murray Butler and of our own venerable Gen Isaac R. Sherwood, exactly the measure of abuse and misrepre tation I may expect for exercising here my right of free sp under the Constitution, from those unscrupulous individuals w deny to that document any force and effect as it serves their pri ends, permit me to state it.

I am an American citizen of Protestant descent, coming fro English and Huguenot ancestry, on both sides born in this country for nearly three hundred years. My forefathers were shoe makers, clergymen, teachers, whalers, soldiers, merchants and doctors in New England and New York. They have offered, and in some cases have given, their lives in every war in which this country and the colonies ever engaged. One of them was a president of Harvard College, another a translator of the Bible to the Indians; still another one of the founders of Oberlin College. One went as minister to England, and signed the Grenville Treaty which fixed the northwestern boundaries of the United States and freed the Mississippi to the borders of Louisiana.

Not one of them, to the best of my knowledge and belief, ever invested a dollar in a brewery or distillery, or ever profited a shilling from the liquor industry. The same thing is true of myself.

I want these facts of record, not because of their bearing, for they have none, on this issue, but because supporters of the Eighteenth Amendment and the Volstead Act, lacking material pertinent to the discussion, have falsely attributed to every man attacking it mercenary motives unworthy of men appealing to public opinion.

They have stated, as the *Toledo Times* did recently in an editorial as scornful of facts as it was weak in logic and remarkable for its display of ignorance of the facts of all history, that Doctor Butler and all other men advocating modification of the Volstead Act have been enlisted in the service of the saloon, and that in their blindness they do not see that in attacking the Act they are really attacking the Amendment.

To Be Concluded Next Week

Go where you may, you will not find its equal in all Southern Illinois!

Number Three of a Series of Advertisements on Insurance Service

A Real
Service Institution

Workmen's Compensation is by no means simply an insurance problem. It involves *close hand* scientific service of a highly specialized character, in fact, the proposition is about 85% industrial and 15% insurance.

Claims are limited by law and the deferred *questionable* liability represents less than one per cent of the total losses each year.

Safety engineering on the part of insurance companies a few years ago consisted of introducing mechanical guards and other safety appliances. Mutual Companies and mutualized employers have progressed far beyond the old method of merely guarding machines. Their common interests pointed to the necessity of more advanced and more modern ideas and plans for better results.

The past ten years has demonstrated the practical superiority of *our service* to employers having total annual payrolls in excess of *one hundred million dollars.*

We invite you to ask for these *important facts* in the interest of your concern and your employes.

VISION

WE need this thing. We need men who possess it. We need men who have the courage to express it.

WE need ***vision***—but not visionaries; men of ***vision***—but not dreamers. We need the power to look ahead, good times and bad times—the power to see in the future the answer to the problems of the present.

NOR will mere optimism suffice. We must have the ***vision*** to see the dark as well as the light. We must have that ***vision*** brave enough and practical enough to recognize ill fortune in the wind, to warn us against it, to provide means, if not of escape, of protection.

"SUFFICIENT unto the day are the evils thereof"—yet do we not live for the day only, but for the days to come as well.

VISION! Give us men of ***vision*** in places of authority! Give us men of ***vision*** in our Congress and our legislatures! Give us men of ***vision*** among our employes, in shops and offices. Give us the ability to SEE!

WE ARE RESPONSIBLE

The Case Against Congress—and Business

By ALFRED H. MULLIKEN

President, Pettibone-Mulliken Company, Chicago

WE are all faced by a condition for which we are responsible and which we, nevertheless, resent.

This condition legally deprives us of a portion of our earnings; imposes taxes to which we object for good economic reasons. Envious minds and greedy nds deprive us of a portion of our property while living, and asp more than half of our assets after our death. We find it too pensive to live and we cannot afford to die.

Our business suffers from what we consider unfair and exorbi- nt taxation, and is restricted by commissions, bureaus, investi- tions, that are uneconomic and which we have reason to believe e unnecessary.

Business in the United States today hesitates. It is faced by cialism, Communism, Sovietism, I. W. W'ism, and class legis· ion.

With more than half of the free gold of the world in our pos· ssion, with an ambitious people, with unsurpassed natural sources, business waits. Enterprise is checked, and we wait for me avenue of escape from this condition.

The reason for this condition is your neglect; the remedy is in ur hands.

The immediate cause is the Congress of the United States. The ajority in the last Congress was made up of professional poli- ians and radicals.

From recent personal experience with Members of Congress. know that members of the House vote for bills which they have ver read, and with the numbers of which they are not acquainted. member of the House from Illinois told me that he was elected Congress by ex-saloon keepers, by bums, and by tramps, and proposed to represent his constituents; that men of my class ok no interest in him nor his election and, therefore, he took interest in them.

Prior to 1914 the expenses of the Federal Government were ss than one billion dollars. The expenses of the last year were er three billion dollars. In 1914 there were three Government reaus in Washington. In 1924 there are thirty-three. Every even men above the age of eighteen years support one office lder in the United States.

Laws passed by Congress are unfair, are class legislation, are mplicated, difficult of enforcement, and expensive in their execu- on.

A man took his son to Washington that he might know some· ing about the Capital of the country. He took him at noon the House of Representatives. The House opened with prayer. fter the prayer, the son said to his father, "Dad what did the inister pray for?" "My son, perhaps you noticed that the inister looked this bunch over and then he prayed for the coun- y."

You complain of this condition. Your complaints are well unded, but you have the remedy in your own hands.

From 1776 to 1859—from Washington to Lincoln—from the organization of the Republic until the Civil War—property was protected in this country. Men of wealth were respected. Business men and professional men of high standing had the regard of the community in which they lived and with scarcely an exception were a part of the Government, State and Nation. They considered it a pleasure to participate in Government affairs. They enjoyed the association of men like themselves in this participation. It was a truly representative Government. It was Republic in fact, as well as in name. The commercial, professional and social life of the Nation centered around the Government first, and business was last.

The Civil War entirely changed this situation.

In 1859, Charles Sewell, the Governor of the State of Maine was worth $100,000. He was the richest man in the State and was regarded with great respect. Wealth at that time took its proper place and was respected.

During the Civil War large fortunes were accumulated. Immediately after the Civil War oil was discovered and an era of speculation started. The construction of railroads began and millionaires appeared in our business and social life. Their wealth became the ambition of others and, gradually, the men of ability, of energy, and of resource, devoted more and more of their time to the accumulation of wealth.

At the present time men of that class not only neglect the pleasure of participating in their own Government and exercising the privilege which belongs to them, but they even neglect to vote.

At the last Presidential election, there was cast for all candidates less than 35 per cent of the total vote of the Nation. A short time ago a United States Senator was elected in Tennessee by 10 per cent of the voting population of the State, and the total vote at that election was only 18 per cent of the possible vote. In some of the western states Members of Congress were elected by 7 per cent of the total vote of each state.

A few years ago I attended a dinner given at a private house in New York, which 150 men from all over the United States attended. I happened to be seated next to Frank A. Munsey, owner of the *New York Sun* and other newspapers. I asked Mr. Munsey how he happened to come to this dinner and he said that he had received an invitation from a committee of men, whom he knew and respected, and for that reason he desired to meet them. I asked him, if the same men were in the United States Senate, would he like to go there. His reply was, "I would be there."

When the United States infantry drove the Germans out of the trenches and charged through the poppy fields of France, they shouted, "Where do we go from here?"

At the beginning of this Presidential election, I ask you, "Where do we go from here?" Our soldiers had the right spirit. They were willing to go. You have the charge. You must develop the spirit and you must answer.

PROHIBITION

Its Relation to Our Constitution

By ATTORNEY HARRY B. KIRTLAND

Continued from Last Week

MINORITIES may again, as in the past, undertake further amendment. Majorities may attempt regulation of things which even majorities have no right to regulate. This has been true of every people in history. It is notoriously the tendency of zealots blinded and urged on by religious bigotry, and that such history exists in this country, today, we have every evidence. We have a Ku Klux Klan. We find a constantly asserted claim of right to censor the morals, the actions, even the speech, of our people. There are dozens, hundreds, thousands, of societies, leagues and bunds ever ready and willing to regulate the lives of everybody except themselves. We find this tendency in the political censorship of moving picture films, and in the steady, persistent effort of courts and judges, both state and federal, through extensions of the assumed power to punish for contempt, to nullify the constitutional amendment, freedom of speech and of the press. One form of it finds expression in the inquisitorial powers assumed by government bureaus, both state and national, in the persnickety regulation of the simplest details of railway administration, in the ever growing effort of government officials to inspect, observe, dictate and conduct the private affairs of all business institutions. We see it in the persistent endeavor of some churchmen, as such, impudently to intrude themselves into secular affairs.

For this whole tendency, which in all times has contained within itself the seed of destruction, the presence of the Eighteenth Amendment in the Constitution is both an inspiration and a precedent, and it should be destroyed, as the tendency itself should be opposed and blocked at every step.

Passing to the question of enforcement, the practical application of the Amendment, through the Volstead Act, to the suppression of the liquor traffic, we find everywhere a condition, susceptible of concrete proof, that but for the dangers involved would excite universal risibility, as it actually does universal contempt and disgust.

On this angle of the question, I can speak with authority. At the expense of considerable time and effort, not to say money, I have in the past eight months personally investigated it in eighty-three cities and towns. I have talked with the men who own and operate the seventy ships on Rum Runners' Row opposite New York, and have been in contact with the money interests behind them. I have visited the distillers and brewers of Canada. I have been through all the depots and supply points along Windsor and the other Border Cities. I have talked with officers honest and dishonest, and with bootleggers of both kinds. I have corresponded with reliable informants in every part of the Union and in Nassau, Cuba and Mexico. I have examined official documents and records, both in this country and in Canada. I have read from day to day the newspaper items bearing on the question. I have attended trials and investigations in federal and state courts, and the blackmailing operations of thieving mayors and justices of the peace. I have accompanied federal officers on their raids and assisted them in their unwarranted and illegal stoppage and search of automobiles on our country roads. As a result of these activities, I am in possession of a great many facts.

To some of those, which I can prove independently of myself, let me refer.

Toledo is today, to my knowledge, one of the tightest cities in the country.

You may judge that from the fact that not long ago, federal raiders, myself among them, found respectably clothed white men of decent appearance, who begged and wept for release, seeking in the vilest negro dumps of Canton Street, at a quarter a shot, fresh made moonshine potent enough to cut through steel. We have but a few saloons open to the patronage of unintroduced strangers. There is in our vicinity but one road house catering to the patronage of all who call, and that is in Michigan. Our police liquor squad is vigilant and effective. In our federal squad are some of the few honest enforcement officers in the entire service, and they are working hard. Over and behind them is a splendid federal judge, of deserved national reputation for his conduct of the Texas oil fraud cases, and of equal renown for activity and severity in the punishment of prohibition offenders.

There are here no open bars as in Milwaukee and New York City. Liquor is not served openly on hotel banquet tables as it has been in several of the cities where I have addressed business organizations. I am very certain that our mayor could not escort a guest of the city to any state judge who would interrupt the trial of a bootlegger, a poor foreigner, long enough to entertain mayor and guest with highballs compounded from materials brought from behind law books in the privacy of his chambers. I saw that happen in one of the largest cities of this country.

Toledo is dry. That is to say, it is as dry as any city has been made, or will be made, by law, the propaganda of Mr. Victor Schreiber, local superintendent of the Anti-Saloon League, to the contrary notwithstanding. Such propaganda, by the way, is deliberately inspired and spread by the functionaries of that organization, each as to his own community, in every city I have visited.

Toledo being thus dry and no drier, how dry is it? On Saturday, deliverable as readily as laundry or milk, at prices ranging from $10 to $18 a quart, were on sale nineteen brands of English, Scotch and Irish whiskey. Synthetic gin at $6 a quart, and genuine Gordon at $15. One could purchase seven brands of Canadian beer and ale, two of them excellent, four of them good, and one of them fair, at the very reasonable average price of $8 per case of 24 pints. American champagne at prices but little higher than in pre-war days. Moonshine of every degree of badness, generally quoted by the gallon, price steady at $2 a gallon and up.

Congressman Sherwood in January stated that in the nine months ending November 1st last 3,000 barge loads of Canadian beer were shipped to Toledo alone. I doubted this, and investigated. I now think he underestimated. The Windsor custom records show that from that port alone over 600,000 cases were cleared for Cuba last year, practically all of it in open boats less than thirty feet long. Over the Dixie Highway, there come down from the north, six nights in the week, protected by pilot cars and a signal and intelligence service so perfect as to excite the admiration of an expert, an average of fifty trucks a night, each loaded with from 100 to 200 24-bottle cases of eight per cent beer, this the estimate of men who know the facts, the federal officers who endeavor in vain to stop them. Five other ports near Windsor are export depots, and in January, when the Ottawa government inadvertently forbade temporarily the shipment of liquor from one of them, the small village of Petite Cote, the Canadian National railway had to embargo all freight on its west end until the blockaded beer trains were cleared, and it took three days, this when navigation was closed.

All this activity continues and grows. Last winter northern Ohio capital desired to establish a steamship line under Canadian law to export whiskey from Windsor to Nassau, where they could lay it down cheaper than the Scotch. The promotion, a ten million dollar matter, hinged on the willingness and ability of the Walkerville distillers to furnish the goods. They advised the promoters by letter that they could not co-operate, for the reason that their supplies and production were insufficient for their regular market, that of course being the bootleggers operating between Windsor and Detroit. I have seen that letter. The sale of that steamship company stock, by the way, is entirely legal in Ohio, and the Walkers are building an addition to their distillery.

POLITICS—AND THINGS

News of the Week from New York and Washington

By JOHN M. TOWNSEND

Special Correspondent, Manufacturers News

SOBERED somewhat by the reception given the work of the republican convention at Cleveland by the whole country, the democratic party is now assembled in New York in an endeavor to choose candidates and to work out a platform which will attract support of the voters this fall. Whereas the conservative ng of the republican party dominated the proceedings at Cleve- ıd, the progressive wing of the democratic party apparently s a small majority in the New York thering which, if properly handled, ould dictate the platform in a large asure and play an important part in e choice of candidates. Under the o-thirds rule a deadlock on candi- ıtes is in sight and it can only be lved by the abject surrender of one le or the other of the right of veto by the surrender of both sides in vor of a compromise candidate.

One thing is certain and that is this:

William G. McAdoo must either be ominated or definitely defeated in the ew York convention before that gath- ing can proceed to the consideration any other democratic candidate for e presidency. *George E. Brennan, e Illinois leader and the most power- ıl single factor in the convention, has id that Mr. McAdoo cannot be nom- ıated.* In a trip across the country, which he made many speeches, Mr. IcAdoo has repeatedly said that he an and will be nominated. Mr. Bren- an is a man of his word and usually peaks with a definite knowledge of e facts in mind. Mr. McAdoo is a ghter of the "hurrah" type who be- ieves that if you want a thing hard nough and fight for it hard enough ou will get it. It is perfectly clear that Mr. Brennan will have o demonstrate to Mr. McAdoo on several roll calls that he knows what he is talking about or Mr. McAdoo will have to prove to Mr. Brennan, that for once, he does not know what he is talking bout, before any further moves can be expected.

If McAdoo is to be defeated in this convention that focus around which the greatest strength must rally to accomplish this end will be Gov. Al Smith of New York, the favorite candidate of the 'wets." While New York will be the host city of the convention and, therefore, courteous to all candidates, local pride in Gov. Smith, coupled with a well-organized campaign in his behalf, assures the noisiest, most persistent and best organized effort Smith has the support of the best organized democrats in the country, including Tammany and the Illinois democracy. The rank and file of the McAdoo support is not so well organized although every effort has been made by the McAdoo management to tighten up their lines in anticipation of a long drawn out test. With McAdoo out of the way, however, the next onslaught will be in favor of Smith and if the McAdoo forces can resist it, then the convention must have recourse to a compromise candidate.

With the assembly of the leaders in New York under dramatic circumstances, sight, for the moment, has been lost of the platform fight which will take precedence over the nomination contest, once the convention is under way. Into this contest the contending factions will throw their principal champions at once and it is in this contest that William J. Bryan will inject himself whether wanted or not.

Mr. Bryan is in New York to get a prohibition plank which "will hold water" and nothing else; secondarily he is interested in the nomination of a progressive democrat. Under ordinary circumstances leaders like Brennan and the Tammany crowd do not pay much attention to platform contests. They are not usually particularly interested in candidates except insofar as they may help or hurt the democratic state and county tickets at home. It will be recalled, however, that organized democracy, as represented by New York and Illinois, opposed Bryan and free silver and this time they want a "wet" plank in the platform or a "wet" candidate, or both, and they are also mightily interested in the fight Senator Oscar W. Underwood is making against the Ku Klux and religious intolerance generally.

HAIL! HAIL!

Homer S. Cummings (left), chairman of the resolutions committee; Chairman Hull, and Norman E. Mack.

Senator "Pat" Harrison's keynote address has disclosed that the platform will fulminate against republican dishonesty in office, claim full credit for the bill enacted by Congress and do and say many other expected things, but it is around these two planks—the prohibition and Ku Klux—that the real contest in the resolutions committee will be waged. Incidentally the McAdoo following, which may have a majority of members on the resolution committee, will have to watch their step in this platform fight or they may easily offend their opponents on either plank. As a preliminary to the nomination contest, the battle over the platform may make or break several candidates before the balloting begins.

The nomination of Charles G. Dawes for vice-president by the Cleveland convention has worn well. It has been received with considerable acclaim both at home and abroad and first impressions are often lasting ones with the bulk of the electorate. Europe watches political drifts with far more intensity than do the people of this country and the first deduction of both France and Germany of the Dawes nomination was that the administration now in power intended it as a notification to both that the United States is standing squarely behind the Dawes Commission report.

As a matter of fact the administration had nothing to do with the nomination of Gen. Dawes and, in acquiescing gracefully in it, had no notion of emphasizing the Dawes Commission report except by indirection. The seriousness with which France and Germany have treated the nomination has opened the eyes of the republican politicians to new possibilities. There is every indication that the Germans in this country have weighed the effect of the Dawes Commission report on Germany with more consideration than the politicians and have come to the conclusion that Mr. Dawes gave Germany the first square deal she has had since the war. This will be helpful to the republicans as against any democrat and it may even help as against LaFollette.

Wholly aside from these international considerations, the selection of Dawes as the Coolidge running mate, has put the stamp

OUR ANSWER TO JAPAN

SECRETARY of State Hughes' formal reply to Japanese protest of exclusion sets at rest any uneasy misgivings the American people may have entertained that this country was, in fact, violating an international agreement. Even a "gentlemen's agreement" should be binding. The attitude taken by the Japanese Government hinted at our having taken refuge behind the letter of the undertaking while violating its spirit.

The most significant paragraph of Mr. Hughes' reply, in the light of this situation, is this:

"In connection with the treaty revision of 1911, the Japanese Government renewed this undertaking (the gentlemen's agreement) in the form of a declaration attached to the treaty. *In acquiescing in this procedure, however, this (our) government was careful to negative any intention to derogate from the full right to exercise in its discretion control over immigration.*"

Cyrus E. Woods, retiring ambassador to Japan, is quoted as stating that "it is difficult for the Japanese people to reconcile the passage of this legislation with the splendid assistance which America gave to them at the time of the earthquake. This assistance was so generous and so spontaneous on the part of the American people that the Japanese now cannot understand what seems to them to be a change of attitude."

The fact of the matter is plain. Our attitude toward Japan is unchanged. Were another catastrophe to overtake the island empire tomorrow, our assistance would be just as "splendid," just as "generous and spontaneous."

The United States has simply exercised, as President Coolidge has so ably stated, "its prerogative in defining by legislation the control of immigration instead of leaving it to international arrangements."

NOW IS THE TIME

NOW is the time for the manufacturer and the businessman, especially if he is the kind disposed to grumble as to the way our late lamented Congress conducted itself, to get in his work and the way to get in your work is to commence at the bottom.

Get acquainted with the politicians who run the precinct organization. If you are a democrat, hook up with the democratic organization. If you train in the other camp twine yourself around the republican bean pole. Go to the meetings and touch elbows with the boys. Become part of the organization.

Approach the political questions in the same attitude and from the same viewpoint as you approach your business.

Every successful manufacturer knows his business from soda to hock. When he wants to get an order he does not wait for an introduction to the prospective customer. He walks in, introduces himself and talks the merits of his product.

Do you suppose the precinct captain will not be glad to see you? He is looking for co-laborers in the vineyard.

INTOLERANCE

INJECTION of the "religious question" into the proceedings of the Democratic National Convention is as unfortunate as it is intolerant and un-American.

The nomination—or election—of a president of the United States is not a fit subject in which to introduce questions of religious faith or fraternal affiliation. Whether one candidate be a Roman Catholic, the other a member of the Ku Klux Klan, the third a Jew or the fourth a member of Masonic Orders has no bearing on the issues involved.

Political directors who are injecting the "religious question" into the campaign are doing so—and knowingly—for purposes of making political capital out of something that has no place in American politics.

The United States has ever been a land wherein religious freedom reigns supreme —where men stand upon their records *as men*—where all are members of one body politic, not of churches nor of fraternal organizations.

To destroy this tradition—to subvert it to political purposes by raising false standards upon which to judge the worth of candidates for the chief office of the nation —is to rip from beneath the national structure one of the principal pylons in its foundation.

LABOR'S RECORD

CABLED reports received by the United States Department of Commerce furnish an illuminating commentary on the effect the British Labor Party Government is having upon the United Kingdom's trade and industry.

The reports show that foreign trade in May approximated one billion dollars—*a 28 per cent increase over April.*

They show further that, during the period the Labor Party has been in power, trade has aggregated about five billion—an increase of approximately 19 per cent over a comparable period last year.

The principal increase in imports has been in raw materials, while the chief gain in exports was in manufactured articles, significant of stimulated industrial activity.

Here, however, are no out-at-the-elbow, down-at-the-heel fanatics in control of Government. The British Labor Party Government is constructively conservative, with thinking men at its helm. Its program is neither confiscatory, bigoted nor bolshevik.

One wonders whether American labor might not profit by the example. A sane policy designed for the good of the country —not simply of labor alone. Is not that what American labor needs? Is not lack of it American labor's greatest handicap?

ANOTHER PROBLEM IN RE. SURTAXES

HIGH surtax rates in the United States have resulted in a new angle to the European situation. It appears that it will prove difficult to make loans to Europe, as provided under the Dawes Plan, because America is unwilling to subscribe to foreign securities which are wholly taxable and make for surtax liability.

Another angle in re. surtaxes and foreign investment is seen in the growing nervousness of fiscal authorities here concerning the continued influx of gold into the United States. Officials would like to see some of that gold, now coming in at the rate of a million dollars a day, go out in foreign loans. There are some who regard it as a menace and a threat.

Gold circulation is replacing Federal Reserve Note circulation, and the Federal Reserve Bank rate has ceased to be an instrument of credit control in consequence. So broad a foundation of gold now exists that member banks find themselves in a position of independence.

The stage is set for speculation and inflation. That neither has, as yet, appeared, is due, probably, to the caution being exercised because this is "a presidential year."

GRAIN AND THE FARMERS

A PLAN for the sale to farmers of the elevators and other facilities of five of the largest privately owned grain handling corporations in the United States, which probably will involve $20,000,000 to $30,000,000, was announced this week by the American Farm Bureau Federation, to whom the proposition was presented.

"THIRD PARTY" MOVEMENTS

Probability of a New Third Party This Year; An Historical Review of Past Organizations

THE country at present faces the probability of a new third party movement which, whatever its fortunes at the polls in 1924, may have an important influence upon the future political history of the United States. While the strength of the two party system is beyond estion, an examination of American political history shows t independent political movements frequently have had an im-rtant influence upon election results and considerable influence moulding subsequent political and governmental policies.

The dominant figure in the new political movement is Robert rion LaFollette, the senior senator from isconsin. Senator LaFollette has at this iting made no formal announcement of candidacy or his plans for the coming mpaign. A fairly definite indication of at is in his mind has been given, how-er, in his letter of May 26 to the Attorney neral of Wisconsin.

"The approaching Democratic and Re-blican conventions will demonstrate to e people whether either of those parties n and will purge itself of the evil influ-ces which have long dominated them," said. *"This cannot be accomplished by erely nominating some alleged progres-ve and filling the platform with mis-ading promises. It demands the elimina-n of monopoly control, the downfall of e corrupt political bosses, the adoption truly progressive principles and the re-diation of those great campaign contrib-ors who have in the past bought up both rties.*

"If this is not done, a long suffering and ghteously indignant people will find in e coming campaign effective means, in-pendent of both these old parties, to take ck control of their government and make truly representative."

"RED" CANDIDATE

U. & U. Photo

Duncan McDonald, Chicago mine union official, nominated as candidate for the presidency on a "Third Party" ticket at convention in St. Paul.

A full statement of the senator's political lans is expected. It will, in all probabil-y, take the form of an address to the mercian people announcing his candidacy an independent progressive for the pres-ency. The announcement is looked for advance of the meeting at Cleveland July 4 of the Conference r Progressive Political Action, at which the LaFollette boom is xpected to take concrete form. It will not necessarily await the lection of the Democratic nominee for the presidency, if a pro-acted deadlock develops at the New York convention.

Senator LaFollette is expected in his announcement to state at he is not seeking at this time to form a new political party. t the same time he will invite the support of groups of indepen-ent progressives and progressive voters in both the major arties for his candidacy. He is expected also to state that he ill regard his candidacy as a national referendum upon whether e people desire the establishment of a new party. If the result f the election is such as to justify a belief that a new party is esired by any considerable body of the electorate he will under-ke the formation of such a party after the election.

How the vice presidential candidate is to be selected is a ques-on still to be determined by LaFollette supporters. The vice-residential candidate may announce himself in the same manner s the head of the ticket, or he may be brought forward at the leveland convention. The vice presidential candidate is likely to be a Democrat, but not an outstanding party leader. Huston Thompson, chairman of the Federal Trade Commission; Joseph B. Eastman, Interstate Commerce Commissioner, Rep. George Huddleston of Alabama, and William H. Johnston, president of the International Machinists, are the names most frequently mentioned in this connection.

If a vice presidential candidate acceptable to LaFollette and willing to make the run cannot be secured, the Wisconsin senator may stand for election alone. There are two precedents for this course. Martin Van Buren, running for re-election in 1840, was deprived of a running mate through the inability of the Democratic convention to come to a choice under the two thirds rule. He was defeated by William Henry Harrison, the Whig candidate. Charles O'Conor of New York, nominated for president on the Labor Reform ticket in 1872, made the run without a vice presidential nominee. He secured 29,489 votes.

The method of self-nomination, expected to be taken by LaFollette, and perhaps by his running mate, was used in the south by candidates for state and local offices down to the Civil War and by candidates for parliament in Great Britain until comparatively recent years. No candidate for president of the United States not nominated by a convention has received a vote in the electoral college, however, since 1836 when the convention system came into general use.

In his announcement of his candidacy Senator LaFollette is expected to set out a personal platform which he will invite the Conference for Progressive Political Action and other groups of independent voters to endorse. This platform will distinguish between immediate aims and future aims, for which the new party, when organized would stand.

Senator LaFollette is not expected to ask Senators Norris, Brookhart, Wheeler and others who have stood with him in his contests in Congress, but are aligned with the old parties, to support him in his campaign. Progressive senators who are standing for re-election would have the support of his partisans, however, and would be invited to take positions of leadership in the formation of a new party after the election, along with such electors as cast their votes for the independent ticket in the electoral college.

Considerable interest centers in the type of campaign to be made by Senator LaFollette. During the last three months he has survived an attack of double pneumonia. At present he is in good physical condition, but it is admitted by his close friends that a whirlwind speaking campaign would probably have very serious results. It is being recommended to the Senator that he retire to some quiet place for the summer, conducting the campaign principally with letters and statements, and making a few striking speeches in states which develop as fighting grounds toward the end of the campaign. Pamphleteering, a method employed with great success by the Labour Party in Great Britain, would probably be used on a considerable scale.

Those close to Senator LaFollette have pointed out that the candidates in the past who have made the most extensive speaking campaigns have almost without exception been defeated.

Lincoln, the first successful candidate of the Republican party, made only one or two public statements during his first campaign, whereas his opponent, Stephen A. Douglas, made a number of speeches in the South. Horace Greeley, the candidate of the Liberal Republicans in 1872, was the first presidential nominee to depart from the usual custom of candidates by undertaking a campaign of stump speeches. The prevailing sentiment up to that time seems to have been that a candidate, who soon might be the president of all parties, should refrain from anything in the nature of stump speaking. Greeley died soon after the election.

James G. Blaine made an extensive speaking tour during the Mugwump campaign of 1884 and was defeated by Cleveland, who made but few speeches. Bryan was defeated in 1896 on the heels of the most strenuous speaking tour that had been made up till that time, and the election went to McKinley who remained on his front porch. Similarly Taft, who swung the circle in 1891, traveling 13,000 miles and making more than 200 speeches, received only eight votes in the electoral college. Wilson remained at Shadowlawn during most of the campaign. The most extensive speaking tour in American political history was made by Cox in 1920. He was overwhelmed by Harding, who conducted the front porch type of campaign.

LaFollette, if he follows the advice of his friends, will make few campaign speeches, husbanding his strength for the work of organizing a new party after the election. There is still a remote possibility that LaFollette will not be a candidate, but it is regarded as entirely unlikely that the Democratic convention will adopt a platform or name a candidate who would receive his endorsement. It can be definitely stated that McAdoo, as the Democratic candidate, would not meet the Wisconsin senator's specifications.

The prospect is, therefore, that LaFollette will be an independent candidate, inviting the support principally of the farmers and the workers, and seeking thereafter to mould a new party out of these elements. There is little doubt that LaFollette's candidacy will receive sufficient support to permit its interpretation by him as a mandate for the formation of a new party, or an effort to capture one of the old parties. There seems to be little expectation in any quarter that Senator LaFollette will be elected, but there is the distinct possibility that his candidacy will throw the election into the House.

With the exception of 1912, there has been no presidential year since the Civil War in which any candidate for the presidency nominated by an independent party has had the remotest chance of success. Again excepting 1912, when the Progressive party secured 27 per cent of the vote, the combined vote of all independent parties has exceeded 10 per cent of the popular vote on only one occasion—in 1892 when the Populists polled 1,041,028 votes.

During the last fifty years there has been a balance, amounting almost to an equilibrium, in the strength of the two dominant parties. In the last twelve elections there have been only six in which one party received a majority of the vote and only five in which the difference in the percentage of the vote received by the Repubilcan and Democratic parties exceeded five per cent.

The percentage division of the vote between the two major parties in the last twelve presidential elections is shown in the following table.

	1876	1880	1884	1888	1892	1896
Republican	50.49	48.23	48.89	48.66	43.02	50.88
Democratic	47.95	48.31	48.27	47.82	46.04	46.77

	1900	1904	1908	1912	1916	1920
Republican	51.69	56.41	51.58	23.17	46.07	62.7
Democratic	45.51	37.60	43.05	41.82	49.28	35.9

The vitality of the two party system is attested by the fact that for the greater part of the period since the adoption of the constitution there have been only two major parties in the political field, despite numerous third party efforts.

The first division, coming toward the end of Washington's term, was between Federalists believing in a strong central government, and Republicans or Anti-Federalists, holding the state rights doctrine. Washington and John Adams were Federalists. Jefferson was a Republican. The term "Democrats" was first applied as a term of derision to the Jeffersonian Republicans.

In the end it was adopted by the Republicans as the name of their party. The Federalist party disappeared during the administration of James Monroe—"the era of good feeling." Many Federalist principles had meanwhile been adopted by the Republican-Democrats. John Quincy Adams was elected as the candidate of a division of the Jeffersonian Republican-Democrats. which subsequently became the National Republican party, later to be called the Whigs. The ensuing elections, until the rise of the present Republican party, were contested between the Democrats and the Whigs, which were the major parties of that period.

The present Democratic party traces back to the original Republican party of Thomas Jefferson. The present Republican party, originating in a mass meeting at Ripon, Wisconsin, early in 1854, was the result of a series of independent anti-slavery movements, which began in 1840, with the formation of a third party by political abolitionists opposed to both the Democrats and the Whigs.

The new Liberty party received only 7,000 votes in 1840, but polled 65,000 votes four years later. The existing parties sought to straddle on the slavery question, with the result that the new political movement after 1844 received large reinforcements of "Conscience" Whigs and anti-slavery Democrats in the North. Out of these elements the National Free Soil Party was formed and polled 291,263 votes in 1848. Its strength declined somewhat in 1852, due to compromise legislation on the slavery question in 1850. In 1854, however, the Missouri Compromise was repealed by the Kansas-Nebraska bill and territory which since 1820 had been considered beyond the reach of slavery was opened up to dispute. Abolition agitation was immediately revived and the Republican party was formed as a result.

In the election of 1856 the new party revealed surprising strength, polling 1,341,264 votes with John C. Fremont as its candidate. The election of that year went to the Democrats, but that party rapidly disintegrated thereafter as the Whigs had been disintegrating in previous years, due to their inability to take a definite stand on the slavery question. The election of 1860 went to Abraham Lincoln, the Republican candidate, and the Republican party held control of the government down to the Cleveland election of 1884.

The example of the Republican party unquestionably encouraged all subsequent third party movements, although none of these met with the same success. The historic precedent of his own party, originating in his own state, is believed to be the inspiration for the prospective effort of the senior senator from Wisconsin. Like the Whig and Democratic parties, which were unable at the middle of the last century to deal with the slavery issue. and the Republican and Democratic parties of the '80s, whose unwillingness to face the money issue led to the rise of the Populists, Senator LaFollette believes that the Republican and Democratic parties of today are unwilling or unable to come to grips with the economic issues of greatest interest to the farmers and the workers. It is worthy of note, in this connection, that the Republican pary was established after and not immediately in advance of a national election, and that it required six years of organization to carry a presidential election.

The Populists or *People's Party*, after securing 22 seats in the electoral college in 1892, and tremendously increasing their strength in the South and West during the ensuing four years, compelled the adoption of the major planks in their platform by the Democratic party in 1896 and the choice by the Democratic party of many Populists as its electors.

The evolution of the Populists traces back to the distress of the western farmers, due to high freight rates and the discriminations of railroad combinations, and the widespread unemployment from 1873 to 1878. The resulting discontent first found political expression through the Greenback party. This party expected originally to solve all economic problems largely by increasing the issue of legal tender paper money, which it was thought would bring about higher wages and higher prices and relieve business depression. Later the party added various other measures designed to benefit labor and destroy railroad and other

PRINCIPLES OF STUDY

Ninth Article on Training Factory Foremen

By J. K. NOVINS

All Rights Reserved

BEFORE outlining the study course for the foremen group conference at least three things should be taken into consideration: 1, the length of the course; 2, the special needs of the plant and the foremen at the time; and 3, whether the course should start with general principles and then work up to practical considerations, or the reverse.

If the course is intended to be a lengthy one, lasting a year, two or three years, it is presumed that the instructor can then touch on the history of the plant and the industry, the plant's general and labor policies, without in the least minimizing attention to practical considerations involving the individual foremen's managerial problems. Also, the subjects treated in the longer course may be treated more thoroughly than in a short and intensive course.

A short course may talk up subjects that ought to be covered in a more lengthy course, but more often the short course is merely an elementary and introductory one, leading subsequently to the inauguration of a lengthy, and some permanent course of training. The length of the course may depend a great deal on the special needs for training at the time. A special effort to increase foremen's efficiency and bring about greater production to meet greater demands on the company's products will call for a short and intensive course designed to bring quick results. A lot depends on the nature of the industry, the technical knowledge possessed by the foremen, and the complexity of processes.

The general practice is to start the course with general principles and then work up to actual practices within the plant. One reason for this is that the men are introduced to matter with which they are already familiar, and by acquainting them with generalizations you place them in a position where they will better interpret practical problems. That is, they will think out the problems from the point of view of the entire plant organization rather than from a narrow production standpoint.

The entire course program, and the individual conference programs should be outlined in advance. If possible the outlines should be furnished the men at the start of the course. A week or two before each conference the men should be furnished with an outline of the conference program.

For purposes of comparison, and as a guide to the conference organizer, we will now present typical outlines actually used by study groups and recommended by foreman-instruction specialists. The first is the outline of a standard twelve-week course which is being used in several hundred large and small plants, among them Swift Co., which has introduced the course in its 28 plants in all sections of the country. This company's foreman training program is regarded as the most extensive educational campaign ever undertaken by a company within a short period of time. The twelve-week course is divided into six units, each unit covering two weeks of group and individual study, and is outlined as follows:

- *Unit I—Team Leadership*
  - *Your Share in Production*
  - *The Starting Point for Promotion*
  - *How Teamwork Developed*
  - *The Six Types of Business*
  - *The Coming of Machinery*
  - *Economics of Industry*
  - *Factors in Successful Manufacturing*
  - *Quantity Production*
  - *The Business as a Unit*
  - *Employer and Employee*
  - *Human Nature in Production Work*
  - *Self-Analysis—Testing Personal Effectiveness*
  - *Organizing Yourself for Advancement*
- *Unit II—Handling Men*
  - *The Good Foreman is a Diplomat*
  - *Leadership can be Acquired*
  - *Handling Men Through Personality*
  - *Handling Men Through Self-Interest*
  - *Handling Men Through Organization*
  - *Handling Men Through the Pocketbook*
  - *Stimulating Individual Diligence*
  - *Differential Piece Rate System: Task and Bonus Systems*
  - *Difficulties in Handling Men*
  - *Helping Men to Play Safe*
  - *Helping Men to Think Straight*
  - *Helping Men to Make Good*
- *Unit III—Organization*
  - *The Organization Chart*
  - *The Organization at Work*
  - *When Production Reaches its Height Level*
  - *Steps in Forming the Factory Team*
  - *Holding the Team Together*
  - *Labor Turnover—Its Cost—How it Can Be Reduced*
  - *Hiring and Firing*
  - *Knowing Your Men*
  - *Three Factors in Man-Management*
  - *Team Spirit—Getting the Feeling of "Our" Plant and "Our" Organization*
- *Unit IV—Handling Equipment*
  - *The Application of Machinery*
  - *Types of Manufacturing*
  - *The Plant*
  - *Outside Factors Which Affect the Plant*
  - *Plants and Layouts*
  - *Machinery and Equipment*
  - *Handling Materials*
  - *The Purchasing Organization*
  - *Waste, Deterioration, Spoilage*
  - *Packing and Shipping*
  - *The Stock Room*
  - *Routing—Cutting Out Waste Motions*
- *Unit V—Production Records*
  - *Why Efficient Production Involves Record-keeping*
  - *The Kinds of Records that are Kept*
  - *Charts*
  - *The Requisition*
  - *Cost Accounting*
  - *The Three Elements in Production Costs*
  - *Systems of Cost Accounting*
  - *Overhead*
  - *The Cost Sheet*
  - *The Auditor and Advisor*
  - *Statistics—Their Proper Classification and Uses*
- *Unit VI—Principles of Management*
  - *Plans of Organization*
  - *The New Elements in Management*
  - *System—A Necessary Tool, Not a Master*
  - *The Workmen's Interest in Increased Production*
  - *Internal Factory Organization*
  - *The Planning Department*
  - *Need for Labor Engineers*
  - *Human Factors*
  - *The Path of Advancement*

By way of contrast let us take a three-year course, such as was :ently suggested by Henry C. Link, vocational education author- . According to Mr. Link the topics covered during the first ar of the three year course should be lined up as follows:

1. Company's policy and then story of the company's growth.
2. The nature of the company's product or service in relation similar products or similar services rendered by other com- nies in the same field.
3. Advertising, sale and distribution of the company's prod- ts.
4. Relation between the public and the selling department and ; effect of this relation upon the manufacturing departments.
5. Cost department in its relation to the selling department and the various manufacturing departments.
6. Purchasing and store departments.
7. Maintenance Department.
8. Planning or industrial engineering department.
9. Experimental or development department.
10. Industrial relations or personnel department and labor licies of company.
11. A study of each of more important manufacturing depart- ənts showing flow of material and the relation which each of ese departments bear to the others.

Mr. Link suggests that the second year of the course should ver the ground more specifically to meet the individual prob- ms of the foreman and the factory. For this purpose, he sug- sts, the group should be smaller. He suggests that the subject atter be grouped under the following headings:

1. Material Problems.
2. Equipment Problems.
3. Labor Problems.

The same ground should be covered during the third year of e course, but the matter should be gone into more thoroughly, ıd foremen should be called upon to settle important problems.

Dr. Roy W. Kelly, former director of the Harvard University ureau of Vocational Guidance, suggests the following outline in s book, "Training Industrial Workers":

1. Plant, machinery, equipment, materials, and processes or erations: Plant layout: power; purchasing; receiving and stributing materials; the shipping department; stockkeeping; uting; classification of processes or operations; standards of ıtput; maintenance or upkeep of department.
2. Company organization and policies: Functions of execu- ves and relations between departments; special administrative roblems affecting foremen; history and policies of the company.
3. Planning the day's work: Scheduling and routing; elim- ıation of waste in materials, idle machinery, and unnecessary ıbor; fatigue; time study; aims and methods of the planning ɜpartment; interdepartmental co-operation; teamwork.
4. Production records and reports: Cost accounting; inven- ries; methods of distributing overhead; requisitions; job and ay tickets; reducing waste; technique of making and filing re- orts; use and methods of preparing special reports.
5. Employment and service management: Aims and methods f the employment department; interpretation of statistics of ac- idents, infections, lost time, labor turnover, absenteeism, etc.; roper attitude toward promotions, transfers, discharge, and iscipline; wages and hours of labor; stimulating individuals nd groups to better accomplishment; tact in handling em- loyees; hygiene; plant sanitations; home and community prob- ɜms affecting the shop; job specifications; rating employees.
6. Training employees: Job analysis for training purposes; :eps in the learning process; cooperation with the plant edu- ational director and with community institutions; what training as accomplished in other plants or other departments; develop- ıg esprit de corps.

In addition to the production and management course some ime should be devoted, if possible and when time permits, to ome technical training. That depends largely on the technical :aining the foremen have already had. The foremen should e taught the special uses of new and old tools and they should e acquainted with new processes.

In some plants the foremen are given special courses in shop ıathematics. This is a difficult branch to teach, especially where

What Are You Looking For From a Printer and Binder?

Equipment The necessary modern efficient machinery and buildings to economically and speedily produce the printing and binding required.

Personnel An organization of thoroughly trained men and women to operate the plant and deliver according to agreement, both as to time and quality.

Experience Forty-six years of active continuous operation under the same name and management.

Our advice is to place your printing and binding with a firm that you know has these qualifications.

Your inquiries will be given our utmost care and attention.

the foremen have not received high school training in mathematics. The foremen are taught shop arithmetic, shop algebra, shop geometry, shop trigonometry and logarithms, and they are taught how to apply formulae to every day shop operations.

We will conclude with a reproduction of a typical outline for a single group conference. This was used in a plant where foremen-training is in progress:

SUBJECT: AIM OF MANAGEMENT

1. INTERPRETATION OF MANAGEMENT
   - *A. Broad:*
     - 1. Gathering data relating in general to:
       - a. Conditions
       - b. Methods
       - c. Processes
       - d. Results
     - 2. Applications
       - a. Interpreting data
       - b. Establishing of standards
       - c. Means of utilizing data and standards
       - d. Establishing means of further investigations
       - e. Securing maximum prosperity for employer, employee and community.
   - *B. Narrow:*
     - 1. Collecting data relating to:
       - a. A particular or specific activity.
2. THE THREE COMPONENTS, BROADLY SPEAKING IN MANAGEMENT:
   - *A. Organization*
     - 1. Division of work, to be done into defined tasks.
     - 2. Assignment of these tasks to individuals.
     - 3. Deals with qualifications and characteristics of human beings:
       - a. Engineer's type (Edison, the Wrights, Bell)
       - b. Executive type
       - c. Specialists
       - d. Functionalists.
   - *B. System*
     - 1. Methods pursued by organizations in carrying out tasks.
   - *C. Administration*
     - 1. Work of organization in operating, the management mechanism or system.

COST OF RENT

Rents in the United States in March, 1924, were higher than at any time since 1914. This increase in rents was considerably greater than the increase in the cost of any other major item in the family budget except coal, which was two points higher. All of the other items in the budget at some time since 1914 had, however, increased relatively more than had rents in 1924 but by the time of greatest rent increases, these other items had receded from their peaks.

The National Industrial Conference Board, in connection with its investigations of changes in the cost of living in the United States, has had occasion to study the relative proportion of the family budget necessarily spent for rents by wage earners' families at different periods within the past decade. In 1914, according to careful investigations, the proportion of the total family outlay which went for rent averaged 17.7 per cent. Assuming that exactly the same standard of living which prevailed in 1914 has been maintained throughout the ten-year period since that time, the relative importance of rents in the family budget may be calculated. The table which follows shows the percentage of the total family outlay which on this basis necessarily went for rent at specified dates since July, 1914, up to and including March, 1924.

PERCENTAGE OF FAMILY EXPENDITURES REQUIRED FOR RENT, ON THE BASIS OF MAINTAINING THE PRE-WAR STANDARD OF LIVING

July, 1914	17.7	November, 1920	15.2
July, 1915	17.6	March, 1921	18.0
July, 1916	16.6	July, 1921	18.3
July, 1917	14.1	November, 1921	18.3
March, 1919	13.4	November, 1922	18.7
July, 1919	13.2	March, 1923	18.9
March, 1920	13.5	November, 1923	19.3
July, 1920	13.7	March, 1924	20.0

Continued from Page 7

definiteness, of Americanism and of safety on the republican et and it has aroused considerable enthusiasm as well. Dawes l make his mistakes the same as others but he has the old oseveltian faculty of keeping things moving so that the coun- will not have time to dwell too long on either his successes or failures.

C. Bascom Slemp, the President's secretary, returned to Wash- ton from Cleveland so loud in his complaints of the way Wil- m M. Butler, the Coolidge campaign manager, had manhandled t convention as to raise a doubt as to whether or not Mr. Slemp 1 stay in his job. Those who know Slemp best attribute his tburst to habits of mind and action running back over a period years, but one of those "habits" has never been to "talk too ich" as Slemp has done in this case.

Slemp is a man of independent means. He is fifty-four years l and for more than a generation he and his father have been litical "bosses" in the republican party in Virginia, accustomed voting their delegates in accordance with their best judgment. the primary campaign this year Slemp lined up nearly the ole South behind the President. When he got to Cleveland his dual capacity as Secretary to the President and as "boss" his Virginia delegates, if not of most of the southern contingent, found William M. Butler in authority over the administration rces.

Mr. Slemp went along on the presidency and the platform, it he favored the nomination of Senator Charles Curtis of Kan- s for vice-president. Curtis was the candidate of the senatorial oup which was not a bit popular in the convention, particularly administration circles. The Curtis candidacy never got started id Slemp voted Virginia for nearly every candidate in the field 1 the first ballot. He voted Virginia for Lowden and he voted irginia for Dawes while Butler was trying to nominate Kenyon, urton and then Hoover.

As a result of the Slemp yell upon reaching Washington, the resident has let it be known that Butler will continue to run his impaign; that the executive committee, of which Slemp hopes be a member, will be subordinate to him and that, in the final nalysis, Calvin Coolidge is boss of the whole works. If Slemp olds his job it will be on that understanding.

CHURCH AND INDUSTRY

By William H. Barr

AT times I have been impressed with the suggestion from ecclesiastical sources that it is possible to improve social conditions by disregarding economic facts. I confess that such recommendations have always seemed more likely to result, if followed, in ie permanent injury of those to whose interest they were osten- ibly addressed.

Eminent churchmen give ready support to what is vaguely de- cribed as "the demand for a new social order," by declaring mong other things that the present state of civilization has pro- luced an unequal and unfair distribution of wealth. It is said hat "2 per cent of the population owns 60 per cent of the wealth."

I was taught to believe, as an American, that inequality in ossession was the inevitable result of the preservation of equality f right and opportunity. For, since the Almighty Dispenser of ll talent distributed it unevenly, the inevitable result of its exer- ise, conditioned by the development of character, is the widest ariation in success. Inequality in fortune is, therefore, the un- voidable result of preserving the exercise of personal liberty.

James Madison emphasized the sound economic foundation of ur governmental system when he declared it was the primary urpose of government to protect the differing capacity of men o acquire and use property. He saw in that fact all the conse- uences that express themselves in the political and social after-

CONSTRUCTION

BOND

"The Paper of Known Substantial VALUE"

FIRST impressions do count and they mean just as much in the letters you write as in the interviews which your salesmen secure to sell your goods.

The first impression which any letter makes depends on the stationery on which it is written. For as you have frequently heard—"Your stationery is your business photograph."

You can secure, if you are willing to pay the price, impressive stationery which *advertises* its *expensiveness* and, theretofore, inevitably suggests extravagant methods, high prices and fat profits—or you can use CONSTRUCTION BOND, the Paper that makes Impressive Stationery at a USABLE PRICE.

Construction Bond is known to be less costly for its quality than other fine bond papers because it is marketed not through local jobbers a *fraction of a ream* or more at a time, to any printer or lithographer who will buy them, but *direct* to *responsible* printers and lithographers throughout the United States, in quantities of *500 lbs. or more* at a time.

Thus every sheet of Construction Bond goes into your business stationery *minus* the usual jobber's profit, *minus* his expenses of handling small lots, minus his losses on small and questionable accounts—only the expenses essential to perfect distribution and service are left.

The next time you order stationery be sure to specify Construction Bond, "The Paper that makes Impressive Stationery at a Usable Price."

W. E. WROE & CO.

math of American life. I am sure that the moral significance of Madison's declaration is not less plain to you than the material results of its operation.

I assume that you agree with me that social power rises out of the control which men obtain over the forces of nature in the eternal contest which we, of necessity, wage with her. Our standard of living depends in turn upon the improving standards of production in all industries. It has risen steadily in all human history, as we multiply the power of the human hand. Social power has not been advanced by an increase in physical strength, but chiefly by the continuing application of the mind to the consolidation of the facts of the universe.

As we penetrate the secrets of nature, analyze them in the laboratory, apply them through the arts of invention, and by organization and administration make them available to the service of men, we enlarge the capacity of the earth to support life upon an ever improving scale of convenience and comfort. Thus we place at our disposal an ever larger surplus of wealth, out of which to support the finer and nobler things of life.

It took England five centuries to add four millions to her population. In the first eighty years that followed the Industrial Revolution it increased eight millions. It is thus that improvement in the industrial arts permanently enlarges the capacity to support life and ennobles its quality.

Now let us ask ourselves, is that capacity for physical production improving? Are the wages paid increasing in buying power? Is the wealth produced being more fairly distributed? or has it a dangerous tendency toward concentration? What is the practical way to enlarge the share of "labor" in such production? Are our productive methods wasteful? and how may they be improved?

As to wages, our real concern is whether in the long run they show a substantial increase in buying power. From time to time in particular industries and localities they are likely to show a relative decline, but taking the swing of a quarter century, they reflect a steady general increase.

Let me say that I think the infallible test of progress is the earnings and condition of the great body of labor, but no means have yet been found to sustain or increase wages, save by sustaining or increasing production.

The fallacious idea is abroad that wages should be arbitrarily determined by an employer on the basis of an employe's needs. I believe that such action cannot be taken without dangerous risk to the stability of the business involved. Wages are safely determined only by the production of the individual employe and the condition of the business. There is not a successful employer, past, present or future, who does not know this to be a fact.

It is out of the preaching of such false economic doctrines that confusion has arisen and distrust has been generated. Much of this preaching—in fact most of it—has been done by those outside of industry. If, therefore, men would cease to treat as experts questions about which they have little opportunity for practical analysis, it would do much to clear the mists of misunderstanding.

As a specific example let me suggest that if, for instance, a shirtmaker produced daily ten shirts worth $2.00 each, and his wages are $4.00, he would be receiving one-fifth of his product. If by increasing his skill, or the adoption of improved methods, he doubles the number of shirts, and his wage is still one-fifth of his product, he receives $8.00 instead of $4.00. Where wages respond to efficiency, it must be clear that the more highly he is paid, the greater is the profit for him who employs him.

Reverse the process and the effects of inferior or restricted production point an inevitable counter conclusion.

Moreover, the stimulation of a particular industry energizes the dependent industries which contribute to it, and thus they expand with its development. But out of the sale of the product, whatever it is, must be paid all who contribute to it. Thus the price which is paid for a chair must reward all who contributed to its production, from him who felled the tree from which came the wood to the merchant whose sale placed it on this platform.

FINANCIAL

Current Market Conditions

THE National Bank of Commerce in New York, discussing current market conditions, says:

The Business Outlook

Business at the moment is without definite trend. Further cur-ilment of operations has taken place in some industries in the st thirty days, especially in iron and steel, the manufacture of itomobiles and allied lines, and cotton textiles. There is a nsiderable amount of unemployment in textile centers, in calities where iron and steel is the major industry and in the al-mining districts.

Retail trade is somewhat below the levels of the corresponding eriod of last year. The unseasonable weather has been a deter-ent influence and it is unlikely that the loss of trade from this ause will be made up. Wholesale trade is inactive, buying of ll kinds being on a strict hand-to-mouth basis as has been the ase for a long time. The trend of wholesale prices continues ownward, but at a slow rate.

Crops

This is a period of the year when business is influenced by ncertainty as to crop prospects. The outlook for the autumn of 924 is even more than ordinarily dependent on yields and prices f the crops now being grown. The major business problems ontinue to be the curtailment of agricultural purchasing power nd the overbuilt condition of many manufacturing industries. f crops are average and if they move at prices as good or better han those prevailing in the marketing season 1923-24, there is very reason to expect better business in practically all lines luring the autumn months. Farmers will buy liberally if they an do so. Unfortunately the weather to date over practically he entire country has been more unfavorable to crops than at the orresponding season of any of the last twelve years.

Business Policy

By the middle of July the United States wheat crop will be nostly harvested and it will be possible to form an intelligent udgment as to the prospects for corn and cotton. By that date lso, the campaign issues will have developed. Regardless of rops and politics, however, it is imperative that the business nterests of the country should buckle down and work out their wn salvation rather than hope and wait for a so-called "upward wing." Bankers and farmers, manufacturers and merchants like must abandon the illusion that the cost of doing business is r at least ought to be the dominant factor in determining selling prices. It is true that in the long run cost of production is the largest factor on one side of the equation. Obviously goods will not be produced indefinitely at a loss and output ultimately is reduced if costs cannot be brought down. Over a short period, however, cost of production is a well-nigh negligible factor in the making of a price.

Even over a long period the cost of production of any single class of goods considered alone is not a strong enough factor to determine price except for the absolute necessities of life. Curtailed production and consequent shortage of stocks are no assurance that consumers eventually will pay a given price. Some still may prefer to do without. Others may not be able to pay the price and may be forced to do without. Such is the present situation of most American farmers.

A series of fundamental readjustments have been in progress in American business ever since 1920. The depression of 1920-21 marked the first stage, the elimination of credit inflation. The downward trend of industrial activity which first became evident about a year ago was the second stage. At that time it first was conclusively demonstrated that at current price levels the productive capacity of many industries is definitely in excess of current domestic consumption and of probable export demand combined.

Whether these industries are seriously overbuilt if retail prices

Meeting the Banking Requirements of Modern Business

With a clientele embracing every line of business and a board of directors composed of leaders in every branch of commerce and industry, the Illinois Merchants Banks have an unusually intimate contact with modern American business.

The officers of these banks consequently have a wide experience and are peculiarly fitted to give effective and intelligent attention to the needs of their commercial customers.

Manufacturing Locations for Sale

Along the line of the Chicago, West Pullman and Southern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad, the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound, with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Chicago, West Pullman and Southern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

For complete information, including rates for transportation and prices of land, apply to

T. J. MALONEY, General Freight Agent
606 So. Michigan Avenue CHICAGO

of manufactured goods are brought into a more favorable relationship to the prices of farm products and of other raw materials and the purchasing power of those with relatively fixed incomes is yet to be demonstrated. It may well be that eventually the product of all but obsolete equipment can be absorbed, but this does not mean that it can be absorbed on the basis of the present price situation.

Every business organization faces a problem of costs, the solution of which can not be evaded. It is a many-sided problem, involving wages, labor efficiency and above all the many items lumped together as overhead. Organizations, like individuals, are compelled to give up extravagant habits.

The prices of raw materials are down. The wholesale prices of many kinds of finished goods are now at reasonable levels. It is the consensus of opinion that retail prices have not been similarly liquidated. As long as this condition persists, industry can not reap the advantage of increased volume which should accrue from lower prices.

The contention in some quarters of the retail trade is that high overhead makes it impossible to lower retail prices. If this view is generally held, that trade may well face declining volume and disappearance of profits.

Money Rates

Money is the cheapest it has been since the end of January, 1917, and the expectation is that easy conditions will prevail at least until the course of business becomes clearer.

Call money continues to be in abundant supply. On June 13, the renewal rate was 2 per cent. Time money was lending at 3¼ and 3½ per cent for 90 days. Four-to-six-months' money is lending 3¾ per cent. and some over-the-year loans have been made at 4 per cent.

Offerings of commercial paper are meager but well-known names are rapidly absorbed. The rate on prime names is 4 per cent. Country banks are buying only in a limited way, offerings being absorbed by the main money centers, New York, Boston, Philadelphia and Chicago.

Prime bankers' acceptances have shared the general decline in the money market, and the New York rate is now below London. Brokers' selling rate on prime bankers' 90-day acceptances is 2¼ and 2⅜ per cent.

Securities

All classes of securities have continued to advance during the last thirty days, as a result of the abundance of funds seeking investment. It is a sellers' market, with an especially active demand for blocks of bonds. New issues have been moderate in amount and have been absorbed promptly.

Texas Power and Light

The Texas Power & Light Company has sold $1,500,000 of First Mortgage 5 per cent Gold bonds to the Harris Trust and Savings Bank (Chicago) and Coffin & Burr, Inc.

The company supplies electric light and power to 110 communities in a prosperous agricultural section of Texas, including the cities of Waco, Denison and Paris. The company does the entire municipal lighting in practically all of the communities served and supplies gas in Waco and Paris.

As officially reported for the year ending April 30, 1924, gross earnings were $5,949,453; net earnings were $2,469,045 or 3.75 times the annual interest requirements on the mortgage debt (including this issue) of $650,250.

The bonds are secured, in the opinion of counsel, by a direct first mortgage upon all the property, rights and franchises of the Company. There are $13,005,000 First Mortgage bonds outstanding, followed by $15,400,000 par value of dividend paying stocks and $2,000,000 6% Debenture bonds.

The bonds are due June 1, 1937 and are being offered at 95 and interest, yielding about 5.55 per cent.

GOVERNMENT BONDS

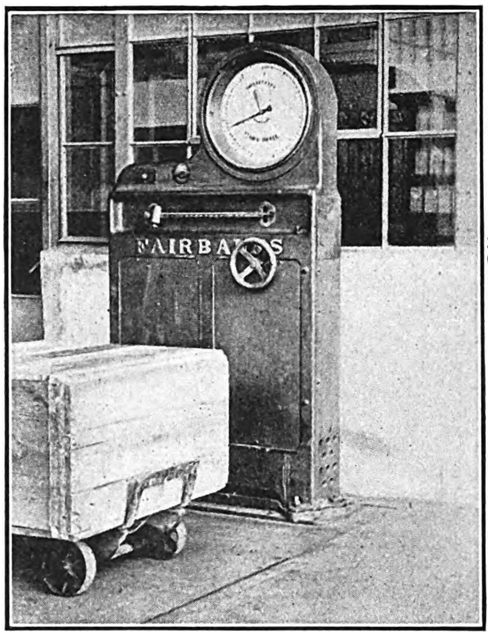
F. CHILDS & COMPANY, the oldest house in America specializing exclu- ely in Government bonds, in their July vestment bulletin will say, in part:

Regardless of the exhibition of unsatis- ctory action and inaction by Congress id the general sentiment of disrespect for me of the laws Congress presumes to pre- ribe, there appears to be sufficient eco- omic law to counterbalance the many llacies of Congress and explain the pres- it commercial and financial condition of ie country. So long as artificial respira- on measures are adopted which conflict ith economic laws, such experimenting ierely delays the establishment of a sound oundation upon which business confidence in safely be erected.

The market for U. S. securities particu- irly responds to the demand on the part f banks which recognize that no other ecurity possesses a like measure of mar- etability and discounting privilege at the 'ederal Reserve Banks.

Recent published statements in the press, etting forth calculations and estimates at- empting to prove the inability of the Treas- iry to maintain a surplus if the soldiers' ionus is granted and if tax reduction meas- ires are also enacted, failed to disturb the eace-of-mind of holders of Government ecurities. The possessors of Government oans have shown full confidence in their xpectation that the market value will not lecline but may reasonably advance to iigher levels.

Considering the present unparalleled vealth of the nation with its industries cap- talized at peak levels of the war, are we iot fortunate in having in hand evidences of our nation's credit in the form of Govern- nent bonds and notes in which to employ ind invest idle funds? In what other man- ier could approximately 20 billions of lollars be satisfactorily and profitably em- ployed at this time if those securities did iot now exist? The strength of our bank- ng and financial structure today is largely lue to the fact that such instrumentalities of our Government's credit available and ield as prime reserves. The holdings of Government securities by banks will undoubtedly show a reduction in their totals from year to year as debt retirement cur- ails the amount outstanding. Only by replenishing their holdings, as bonds and notes mature, and paying the market price to do so, can banks retain their secondary reserves in the form of Government loans. A rapid extinguishment and retirement of the Government loans as now contemplated might reasonably cause far more embar- rassment than any benefits that might con- eivably result. If the retirement of Gov- ernment loans operated to drive money into he development of our country's resources, no one would question the benefit, but inas- much as excessive taxation is now driving he investor into tax-exempt securities the mbarrassment becomes apparent.



Fairbanks Dial Scales

Speed up your weighing with a scale like this?

You can weigh loads as fast as you can wheel them on and off the platform. The large dial shows the weight in *plain figures.* It can be read instantly. Materials are handled quickly . . . and economically.

You do not have to carefully balance the load on Fairbanks Dial Scales to get the exact weight. The load is suspended from — not superimposed upon — the pivots of the levers. It is transmitted according to the fundamentally correct principle—on the center line of the lever. The scales are accurate and they stay accurate.

Let us show you how these scales will help you speed up your weighing.

Peruvian Railway Bonds

In accordance with the provisions contained in laws 2886 and 4728, the Ministry of Finance of Peru is authorized to issue bonds to be called "Bonds of the Tobacco Revenues" up to the amount of 200,000 Peruvian pounds, the Commercial Attaches office at Lima reports. They will bear interest at the rate of 8 per cent per annum and will have an accumulative amortization rate of 2 per cent per annum. The proceeds of this issue are to be used in the payment of all sums owed by the government for railroad construction works and also to provide the necessary funds to continue such works.

Continental & Commercial Securities

The Continental & Commercial Securities Company of Chicago, whose capital stock is owned by the stockholders of the Continental & Commercial National Bank of Chicago, has opened a New York office at 5 Nassau st., in charge of Ray L. Junod, resident vice-president. A direct private wire connects the Chicago and New York offices.

Sanitary District of Chicago

An additional issue of $600,000 Sanitary District of Chicago 4 per cent bonds, dated March 1, 1924 and due serially March 1, 1934 to 1939, is offered at prices for all maturities to yield 4.125 per cent by Taylor, Ewart & Company, Inc., and the Continental and Commercial Trust and Savings Bank, Chicago.

Chile Buying Much Machinery

Exports of industrial machinery from the United States to Chile more than doubled in 1923. In 1922, Chile was sixteenth among the countries of the world as a market for American machinery; in 1923, it rose to tenth position.

If any among the human contributors receive more than their d share, someone receives less than his proportion.

It follows, then, that if any factor is powerful enough to pla an artificial and uneconomic charge upon his service, for whic he makes no corresponding contribution, he does so, not merely at the expense of an employer, whoever he may be, but rather a the expense of other employes who must contribute to his arbitrary exaction, by receiving less than their proportionate due for the service which they contribute.

The rate of wages is not a matter to be arranged solely between the employer and employe, or which depends upon the concessions which either makes to the other. It is fixed by laws as immutable as that which sends the torrent to the foot of Niagara. The wage-earner's return depends on the market value of his product, and nothing else.

If the shirtmaker undertook to pay the worker more than is his contribution to the value of the shirt, he merely accelerates his own movement toward bankruptcy. If, on the other hand, he induces the labor to accept less, he may secure a temporary increase of profit, but the moment unusual profit is shown in any particular industry it attracts the attention of capital seeking investment, and it moves into any tempting field to compete with the capital already invested there. It immediately proceeds to offer a competitive wage for the labor engaged in the older establishments, and our friend, the shirtmaker, must meet that competition, or surrender to it.

There is then, a plain competition affecting the wage rate, that of laborers for employment, which may tend to lower wages, and the competition of capital for investment, which tends to increase them. But the competition of capital for investment is keener than that of laborers for employment, because that form of capital is more mobile, and can shift its investments more rapidly and easily than the worker his place of employment.

A considerable difference in wages may not induce persons to remove even short distances because of social attachments, but the difference of a fraction of a per cent in the rate of interest moves capital from one continent to another.

If a group of manufacturers obtain control of production or territory through artificial monopoly, they may affect prices, but they must still compete with other employers of labor for the amount of service they desire.

On the other hand, if labor, through organizations, can limit the number of those who may engage in a particular calling, or be instructed in a trade, or limit the amount that may be produced, or through legislative intervention require that two must be employed to do the work of one, such labor monopoly may obtain an artificial reward. But unless it be in an essential industry, like construction or transportation, it will surely turn investment toward safer fields. While its monopoly endures and controls, it levies an artificial tax upon its fellow workers, who must live under shelter, and pay rent, and who must buy everything into which the cost of freightage enters. Such monopolies are plainly as injurious in their social consequences as any which can be imagined for the control of prices.

In short, there is prevalent in the minds of many outside of industry the vague idea that the term "brotherhood of man" means that the weaker members of society should be subsidized by the strong, and as a result receive more than they earn. The fact remains, however, that the economics of the Almighty are more sound than the theoretical economics of many sentimental reformers, for the laws of economics are as much God's law as are the Ten Commandments, and he who teaches unsound economic law is as misleading as he who teaches wrong spiritual law. The analysis and solution of economics have been studied seriously for a long time by men as well fitted to their task as is the minister to become a specialist in the development of spiritual character.

Western Electrical Exposition

An exposition to be held at Omaha, November 10 to 15, is a great national electrical show. The exposition will celebrate the fortieth anniversary of electrical service in the state of Nebraska.

Continued from Page 10

-asteful combinations. The Greenbackers were the fore-ners of the Union Labor party in 1888 and the Populists who de their appearance about 1890. The Greenbacker vote was 740 in 1876; 308,578 in 1880, 175,365 in 1884. In 1888, ,934 votes were cast for the Union Labor candidates. The e of the Populists in 1892, which exceeded one million, startled country. The Populist platform of that year demanded, among er things, the free and unlimited coinage of silver and gold at prevailing legal ratio of sixteen to one and the increase of circulating medium to $50 per capita.

From 1880 to 1892, the Republican and Democratic parties l dealt very gingerly with the issues raised by the Greenback- and Populists. There were "Gold Republicans" and "Silver publicans" and "Gold" Democrats and "Silver" Democrats, oughout this period, so that the major parties felt compelled to addle on the money issue in every platform. They held up the iff as the dominant issue.

In 1896 Populist strength had so increased that it threatened mocratic control in the South, and that party, disregarding the luence of the Cleveland Administration and the Gold Demo-its of the East, adopted a platform in which it was recognized it "the money question is paramount to all others at this time" d which demanded "the free and unlimited coinage of both ver and gold at the present legal ratio of 16 to 1." The Repub-an platform of 1896 declared for "sound money" and against ie free coinage of silver except by international agreement." ius the country, as a result of the Populist movement, secured opportunity for a square test on the money issue, and the cision of the question with the defeat of Bryan was accepted by country as final.

The Progressive movement is too recent to require detailed scription. It originated in the contests in the House against Cannonism" and in the Senate against the Payne-Aldrich bill d various other Taft administration measures. During the ial session of the Sixty-First Congress the National Republican ogressive League was organized by nine Republican senators, irteen Republican representatives and five western Republican ivernors. The League was formed in the interest of Senator iFollette and let it be known that he was regarded by the organi-tion as the "logical" candidate for the Republican presidential imination in 1912. Senator LaFollette's candidacy was an-unced in June, 1911. Col. Roosevelt, who previously had inounced that he would not be a candidate, said on February , 1912, in response to the famous petition of seven Republican ivernors: "I will accept the nomination, if it is tendered to me, id I will adhere to this decision until the convention has ex-essed its preference."

The support of Republican Progressives swung thereafter to oosevelt. Senator LaFollette refused, however, to withdraw om the race and his friends expressed extreme resentment to-ard the former president. The results of the Republican primary ections in 1912 are shown in the following table:

State	*Primary elections in 1912* Roosevelt	Taft	LaFollette
California	138,563	69,345	45,876
Illinois	266,917	127,581	42,692
Maryland	29,194	26,068	......
Massachusetts	83,099	86,722	2,058
Nebraska	46,795	13,241	16,785
New Jersey	61,297	44,034	3,464
North Dakota	23,669	1,876	34,123
Ohio	165,809	118,362	15,570
Oregon	28,905	20,517	22,491
Pennsylvania	298,962	193,063	......
South Dakota	35,637	9,843	17,821
Wisconsin	628	47,514	133,354

The charges of "steam rollering," when contests were decided favor of Taft delegates and against Roosevelt delegates to the epublican National Convention, stirred up Roosevelt partisans iroughout the country. These charges were followed by the olt of the Roosevelt Progressives and the organization of the rogressive Party which held its first convention at Chicago in ugust, 1912. At this convention Roosevelt was nominated for

Our Customers Take a Year 'round Vacation

Many a man's vacation is spoiled by Direct Mail worries. He knows that, in his absence, poorly executed Direct Mail may not only lose the respect of his prospects, but customers as well.

We said, "Our Customers Take a Year 'round Vacation." It's true they do, they tell us so. With more than forty years' Direct Mail experience to our credit, why wouldn't they feel safe in leaving their work in our hands?

If you have any Direct Mail worries, as your vacation time approaches, relieve yourself of them by putting them on our shoulders.

A complete printing plant, a full line of presses—special and regular, modern Direct Mail equipment, full corps of trained employes, and a will to give you letters that are letters and printing that is printing, with deliveries as you want them, will give you, too, a year 'round vacation.

INDIA SEEKS NEWSPRINT

Market for Fire Trucks and Textiles in Brazil

NEWSPRINT paper in quantities of 851 reams of 500 sheets monthly is sought this week of American manufacturers by a dealer in India. Also wanted is news cylinder ink in 10 to 20 barrel lots, printing ink and old news papers (large size) in quantities of 300 tons monthly.

Motor fire trucks and textile goods are sought in Brazil, boots, haberdashery, leather goods and school supplies in Canada, and machinery for making cans of one-half pound each are among the other foreign trade requests, confidential information concerning which may be obtained by any manufacturer who will address MANUFACTURERS NEWS giving the serial number of the item in which he is interested.

This week's complete listings follow:

AUSTRIA—
10665: Aluminum and semimanufactured aluminum.
10667: Cedar, red, and incense cedar for pencils.
10665: Copper and lead, raw, 400 tons of each monthly.
10703: Frames, picture.
10667: Graphite for pencils.
10703: Irons, tailor's, electric. Stationery goods, all kinds. Transformers for electric bells and stoves. Toys and novelty goods generally.

BRAZIL—
10674: Fire trucks, motor.
10689: Textile goods.

CANADA—
10683: Boots. Shoes. Haberdashery.
10706: Gift and art goods novelties. Leather goods. School supplies. School bags.

CANARY ISLANDS—
10695: Hosiery, silk and cotton. Underwear—men's and women's.

CHILE—
10672: Lobster canning machinery. Machinery for making cans of one-half pound each.

CHINA—
10664: Ferromanganese, 50 tons.
10700: Handkerchiefs. Handkerchief material.
10666: Lead in bars or pigs, cheaper grades, 425 tons. Sugar, 50 tons.

COSTA RICA—
10648: Rosin. Soda, caustic.
10702: Yarn, white cotton.

DANZIG—
10634: Apricot kernels.

EGYPT—
10628: Cornstarch.
10711: Chemicals, photographic.
10627: Fruits, fresh. Fruit sirup.
10632: Glucose. Greases. Oils. Starch, corn.
10677: Wire nail-manufacturing machinery.
10629: Glucose.
10628: Glucose.
10711: Paper for photostat work.
10627: Raisins.

ENGLAND—
10633: Prawn, headless.
10619: Sugar.
10675: Soldering machines, automatic or semi-automatic.

GERMANY—
10650: Chemicals. Pharmaceutical products.
10697: Cotton waste.
10707: Football shoes. Shoes. Shoes, rubber-soled. Sporting goods. Sport clothing. Sweaters.
10690: Rags, old, dark colored.
10649: Tar, shipments of 20 to 50 tons. Soda, caustic.
10696: Woolen waste from wool carding and spinning.
10697: Yarn, cotton.

INDIA—
10708: Automobiles, low-priced. Balloons.
10661: Copper and zinc scraps for manufacturing zinc chloride.
10708: Curios. Harmonium brass reeds.
10714: Ink, cylinder, news, 10 to 20 barrel lots.
10713: Ink, printing. Newsprint paper, 851 reams of 500 sheets each monthly.
10715: Newspapers, old, large size, 300 tons monthly.
10708: Tires for carriage wheels.

ITALY—
10652: Colors and coloring supplies, best quality.

The Ramsey Chain Company, Inc., Albany, N. Y., announce the appointment of the Morse Engineering Company, 549 W. Washington st., Chicago, as their Chicago representative.

Artificial Silk Now "Rayon"

The word *rayon* has been approved by a majority of the board of the Silk Association of America as a substitute for the phrase "artificial silk."

Continued from Page 8

is transaction would mean the consolida- ı into one association or corporation of ilities sufficient to handle 60 to 75 per ıt of the entire grain crop of this country. contemplates the sale to the farmers of following grain concerns:

Armour Grain Company.
Rosenbaum Grain Corporation.
Bartlett, Frazier & Co.
Rosenbaum Brothers.
J. C. Shaffer & Co.

As the latter controls the Shaffer & eam Grain Company, it probably means ıt this elevator concern also will be in- ıded in the transaction.

If the plan goes through it will mean ıt the farmers will eventually own out- ght the greater part of the grain handling cilities of the country, and as they will so control all the machinery necessary to arketing, financing, and distributing, the ain business, from grower to consumer, ll be under control of the farmers. It reported that the administration at Wash- gton would be favorably inclined toward e transaction, as it would bring the farm- cooperative marketing in the fullest nse of the phrase.

There is, however, a vast amount of re- arch and detail to be encompassed before e transaction can be consummated, chief which is the method by which the deal ight be financed. Details, as announced O. E. Bradfute, president of the Ameri- n Farm Bureau Federation, are meager. The only official information is contained the formal written statement issued by m which follows in full:

"A plan contemplating acquiring the me- ıanical and managerial facilities of five rge grain concerns and 5,000 cooperative evators has been presented to the Ameri- ın Farm Bureau Federation. This plan oposes that the international grain mar- ting sales agency resulting becomes grow- -owned, financed and controlled.

"This plan was presented to the executive committee of the American Farm Bureau Federation this week. After a four-day discussion a resolution was adopted authorizing the president of the federation 'to appoint a committee, of which he shall be chairman, of such size and personnel as may by him be deemed proper to complete the study and analyze the proposition above referred to for the purpose of determining the practicability of the producer undertaking to own the marketing facilities for grain and the practical method by which it may be successfully accomplished to best advantage for the producer."

"The proposed plan includes acquiring the facilities of the Armour Grain Company, Rosenbaum Grain Corporation, Bartlett, Frazier & Co., Rosenbaum Brothers, and J. C. Shaffer & Co.

"The proposal contemplates using the facilities of existing exchanges and operating in accordance with their established rules.

"The company contemplated in this plan will be at the service of state cooperative pools, elevator exchanges, farmer-owned elevators and individuals as a grain merchandising agency.

"It is understood that the tentative plan has been presented to other farm organizations."

Credit Shortage in Germany

The Reichsbank policy of credit restriction has rved to accentuate the credit stringency in Ger- any that has obtained since the first of the year, ys the Commercial Attache's office in Berlin in cable to the Department of Commerce. In nsequence, industrial activity has been con- derably curtailed. This development has been flected in increased unemployment. The only lieving factor in the situation throughout May as the increase in loans to export industries by e new Gold Discount Bank. These loans are w reported to amount to one half of the orig- al capital of the bank. Appeals for provisional ceivership under the recent "Geschaeftsaufsicht" w have recently become so numerous that a strictive revision of the law has been under- ken. Bankruptcies increased to 322 in May as mpared with 133 in April and 68 in March. ıe continued unfavorable balance of trade has rved to increase anxiety, and the conviction is owing in commercial and financial circles that period of severe industrial depression is im- nding.

Chicago-St. Paul Appointments

At a recent meeting of the executive commit- e of the Chicago, Saint Paul, Minneapolis and maha Railway Company held in New York, icial appointments, now effective, were approved, follows: Alex C. Johnson, vice president in charge of traffic, Chicago, Frank J. Berck, general purchasing agent, Chicago.

Farm Labor Easier in North

Increased supply of farm labor from May 1 to June 1 in practically every northern State is reported to the United States Department of Agriculture. Jobs other than for farm work seemed to be harder to find in these States, more men were seeking work on farms, and fewer farmers complained of an inability to secure help. Little change in the supply of farm labor in the Cotton Belt, and a slight increase in the demand for farm workers were reported. Crops were poor west of the Rocky Mountains and farmers in that section needed less labor than usual. Crops were late everywhere east of the Rockies and farmers were behind with their work, but the general report was that wages were still so high compared with the returns from farming that farmers were employing fewer men than in most former years.

Exchange Changes Bother Belgium

The Belgian business situation is dominated by exchange fluctuations according to a cable to the Department of Commerce from Acting Commercial Attache Samuel H. Cross at Brussels. While linen textiles show some improvement, the cotton outlook is still uncertain. The steel market is stagnant due to reserve on the part of buyers, inspired by the expectation of lower German prices. Government finance shows an improvement. Agricultural prospects are generally good, with a sustained demand for foreign grains, though packing-house products show a seasonal stagnation. Warm and rainy weather in May has improved crops remarkably, with result that the yield and time of the harvest may be almost normal in spite of the very late spring. Window-glass plants are threatened by rising production costs and the competition of the machine-drawn product, while difficulty is experienced in effecting wage reductions. Agitation for a window-glass cartel continues, but there is little prospect of realization. Business in early June was slightly improved, but not enough to absorb total production. No unfavorable change can be noted as yet in the plate-glass industry.

The money market is extremely tight, with call funds at 4½, bank paper at 5¼ to 5⅝, and prime commercial paper at 5⅛ to 5½.

A Station on The Voice Highway

JUST as our railroads form a great system and a traveler boarding a train at any station may travel to any other, so the Bell System combines the telephones of the nation and every Bell Telephone is a station from which every other Bell Telephone may be reached.

"Station-to-station" long distance calls meet almost every requirement and the day rates are about 20% lower than for "person-to-person" calls. Evening rates are about 50% and night rates 75% lower than day rates for "station-to-station" calls, but no rate is reduced below 25 cents. Consult the telephone directory for further details or call "Long Distance."

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

FACE FARM FACTS, LOWDEN URGES

Says Cooperative Marketing Is Only Solution

IF the price asked of him for necessities is too high, the farmer has no choice but to pay it.

If the price offered him for his products is too low, the farmer has no choice but to accept it.

That, according to Frank O. Lowden, former governor of Illinois who refused the Republican vice-presidential nomination two weeks ago, is the crux of "what's wrong with the farmers."

Mr. Lowden is himself a "farmer," although his farm estate near Oregon, Ill., with its 4,500 acres and modern business-office facilities presents a strong contrast to the farmlands of his less fortunate neighbors.

According to Mr. Lowden, the country—business and industry—has been playing ostrich, hiding its head in the sands of false optimism and refusing to face the true facts concerning the country's agricultural situation.

"So long," he declares, "as our eminent financiers and statesmen insist from day to day and from week to week that conditions on the farms are bettering and that there is no cause for alarm, just so long will the day of readjustment be postponed."

Mr. Lowden asserted that there are more farm mortgage foreclosures pending in his (Ogle) county in Illinois today than at any other period in the county's history. This condition, he declares, is reflected throughout the nation's agricultural lands.

"Lack of organization, of cooperation," he says, "is the chief trouble. The only salvation for the farmer lies in cooperative marketing of his farm products. Agriculture finds itself with its millions of members competing against itself, while it is obliged to sell its products to a highly organized industrial and commercial world."

Chicago Nipple Manufacturing Co.

The Chicago Nipple Manufacturing Company, manufacturers of "Blue Ribbon" nipples, pipe coils and pipe bending, has purchased the property, 124x268 ft., adjoining their Chicago plant at 1966-76 Southport av., according to an announcement received from Dixon C. Williams, president of the company. The purchase price was $137,500, and was a cash transaction except for the assumption of a $42,000 mortgage already on the property. The company plans to build upon the rear of the property, which backs upon the Chicago River and is already improved with a 1-story building at the front.

New North Western Service

Effective Sunday, June 22, new through fast sleeping car service was established by the Chicago & North Western Railway between Chicago and Lincoln, Nebr., leaving Chicago 6:05 p. m., arriving Missouri Valley 6:35 a. m., Fremont 8:00 a.m., Lincoln 10:05 a.m. Eastbound, leave Lincoln 4:00 p. m., Fremont 5:55 p. m., Missouri Valley 7:05 p. m., arriving Chicago 7:25 a. m. Dining car service, meals a la carte.

PULLMAN COMPANY DIVIDES HOLDINGS

Organizes New $50,000,000 Manufacturing Corporation

THE Pullman Company this week announced the segregation of its manufacturing properties and the organization of a new $50,000,000 corporation known as the Pullman Car and Manufacturing Corporation, which has taken over the manufacturing plants at Pullman, Ill., and at Michigan City, Ind., and now is in operation. The new corporation is headed by men formerly connected with the manufacturing department of the Pullman Company and already has assumed all manufacturing contracts.

Following are the directors and officers of the new corporation:

Directors—D. A. Crawford, formerly vice-president and assistant to the president of the Pullman Company; Clive Runnells, formerly vice-president of the Pullman Company; C. A. Liddle, formerly vice-president of the Pullman Company; W. N. Oehm, former manager of works of the Pullman Company; Ralph M. Shaw.

Officers—D. A. Crawford, president and treasurer; Clive Runnells, vice-president; C. A. Liddle, vice-president; W. N. Oehm, manager of works; S. W. Gehr, secretary.

It was announced that there would be no distribution of stock or assets but that the stock of the new corporation would be held by the Pullman Company. The $50,000,000 capital stock of the new corporation, it was announced, represented the appraised value of the various manufacturing plants taken over. The officers of the new corporation also will be directors, and, in addition, Ralph M. Shaw is a member of the directorate.

The total fee paid to the state for the charter of the new company was $45,000, of which $25,000 was in direct fees and $20,000 in franchise tax.

New Northern States Power Issue

Notices have been sent to the shareholders of Northern States Power Company advising them of a meeting of shareholders to be held July 10 for the purpose of approving recommendation of the directors to authorize a new class of stock to be known as *Class B common stock*, shares of which will be without par value, and upon which no dividends can be paid until after the preferred stock dividends are paid in full. It is stated in the letter transmitting the notice that the increased demands upon the company for services throughout the territory supplied require the construction of generating plants, substations, transmission lines, distributing facilities and other additions and improvements, calling for the investment of new capital.

Class B common stock, it is stated, will rank after the preferred stock and the present common stock as to assets, and will place additional and substantial property values back of both. It will share in dividends with the present common stock, after full 7 per cent dividends are paid on the preferred stock, in the ratio of 10 cents on each share of Class B common stock for each dollar per share paid on the present common stock.

THE REASON FOR HIGH PRICES

An Interview with JOHN M. GLENN

THE CHICAGO JOURNAL OF COMMERCE, on Saturday, June 21, published the following interview by Robert E. Ward with John M. Glenn, editor and publisher MANUFACTURERS NEWS and secretary of the Illinois Manufacturers' Associa- n:

William G. Bierd, president of the Chi- go & Alton Railroad Company, broadcast plea recently that business, industry and bor should unite in a concerted effort to ormalize" their production and sales ındards sufficient to bring about a down- ınt in the cost of living curve.

Yesterday, John M. Glenn, secretary of e Illinois Manufacturers' Association, in statement bearing upon Mr. Bierd's brief, tributed the high cost of production in dustry primarily to "selfishness, igno- ınce and taxes."

Important elements in high living costs ı the United States, according to Mr. lenn, are rent and fuel. "Landlords are ot entirely to blame for this," he said. Those who have erected buildings since ıe war must charge stiff prices for flats nd houses to pay the interest on their in- estment and show a profit. They also re heavily taxed and all their expenses of peration, including decorating and clean- ıg, are exceedingly high."

Extraordinarily high wages paid to uilding mechanics are factors that com- licate the situation, Mr. Glenn asserts. With double pay for overtime and with he bonuses they are able to exact from ontractors," he said, "the weekly pay heck of the average building mechanic far xceeds the net returns of most manufac- urers and business men.

"There is a scarcity of plasterers and ther building mechanics, and wherever ossible it is maintained intentionally and igidly by the labor unions, for they profit wherever there is a shortage.

"That is one reason why the organized uilding trades have been so active in push- ng restrictive immigration legislation. The ıigh cost of building and rent are the in- evitable result of the high cost of building abor."

Mr. Glenn declared that a similar situ- ation exists in the coal mining industry. 'Well organized coal miners with millions of dollars in their treasuries are able to maintain an artificial wage scale entirely out of proportion with the amount of service they perform to the community," he said. "Consequently workers who are not coal miners find their household expense budget materially advanced."

The high cost of freight shipments is attributed to the "high artificial wage scales," and the prices which the railroads must pay for lumber, coal, ties and other supplies—the cost of which is to a great extent influenced by high wages. "Freight shipment costs and the cost of fuel are important factors in high building costs," he declared. "Mr. Bierd points out that all building material shows large price increases. This is directly traceable to such factors."

"Ignorance" on the part of the public is another consideration in high living costs, in Mr. Glenn's opinion. "If people stopped to think and analyze the abnormal living costs since the war," he said, "sooner or later public sentiment would be aroused against the preferential wage rates enjoyed by coal miners, building mechanics, railroad employes and the workers in a few other highly organized industries.

"If the public thinks about this matter at all, it probably imagines that the increased cost of operation comes out of the pockets of the employers. This is a pleasant thought, but unfortunately it is based on wrong premises. If it were true, we would be paying the rents of yesteryear and coal would not be so precious a mineral."

Mr. Glenn does not see any immediate prospect of lower living costs. "It would not be desirable to deflate too rapidly," he declared. "Deflation can be brought about gradually by the operation of economic laws. Most manufacturing industries have deflated insofar as they can individually control the situation, but the prices of manufactured articles, however, are still held up by the high prices for coal, lumber and other raw materials which they must use.

"It is only by cuts all along the line that the normal situation referred to by Mr. Bierd can be brought about and the cost of living lowered in a helpful way to all concerned."

Rock Island $10,000,000 Bonds

Dillon, Read & Company (Chicago) are offering, when, as and if issued and received and subject to approval, $10,000,000 in 5-year 5 per cent secured gold notes of the Chicago, Rock Island & Pacific Railway Company, dated July 1, 1924, and due July 1, 1929. Coupon notes of $1,000 denomination. The proceeds of the notes are to be used to retire $8,000,000 of the company's 6 per cent notes to the Director General of Railroads, and for additions and betterments and other corporate purposes.

Royal Mail Pays Dividend

The Royal Mail Steam Packet Company is paying a final dividend of 4 per cent, less income tax, on ordinary stock. This, with the interim dividend paid last November, makes a total of 6 per cent dividends for the year 1923. The company's annual report for 1923 reveals that, after providing for depreciation and taxation, there is a balance of £819,441, to which has been added £125,527, brought forward from 1922: total £944,969. Deducting for dividends, the company is carrying forward £130,533 from 1923.

president by acclamation, with Hiram Johnson holding the second place on the ticket.

Senator LaFollette refused to join the Roosevelt Movement and remained in the Republican party. In the 1908 convention he had received 25 Wisconsin votes as a "favorite son" candidate for the presidential nomination. In 1912 he received 41 votes, 26 from Wisconsin, 10 from North Dakota and 5 from South Dakota. In the 1916 convention he received 25 Wisconsin votes for the nomination, and in the 1920 convention 24 votes on all ten ballots. In the recent Republican convention he received 34 votes, 28 from Wisconsin and 6 from North Dakota.

The result of the Progressive Party effort in 1912 was to give the election to Woodrow Wilson, the Democratic candidate. The popular vote was Wilson and Marshall 6,293,019, Roosevelt and Johnson 4,119,507, Taft and Sherman 3,484,956. The Progressive party disintegrated as various planks in its platform were adopted by the Wilson administration. The deathblow to the party was dealt when Roosevelt withdrew after having been nominated by the party in 1916 as its candidate and supported Hughes.

Notwithstanding their lack of success at the polls, third party and other independent political movements during the last fifty years have often exerted a profound influence in American politics. They have frequently been more successful as formulators of issues than the two dominant parties. They have not as a rule been under the same necessity of adjusting their platforms to conciliate large groups with divergent interests, as are the dominant parties, whose platforms have frequently omitted mention of the issues in which the people have been most interested.

Of the minor parties, which in the past have commanded a sizeable vote but never succeeded in seating an elector in the electoral college, the oldest is the Prohibition party. It was founded in 1869 and has nominated candidates for the presidency in every national election since 1872. The primary purpose of this party was accomplished in the adoption of the eighteenth amendment, but it has not given up its political form of organization. Issues, aside from prohibition, espoused early in the party's history were woman suffrage, uniform marriage and divorce laws, laws against polygamy and commercialized vice, civil service reform and direct elections.

The Socialist Party, organized in 1897, is the most important of the continuing "third" parties. Like the Prohibition Party it has seen many of its planks, exploited in previous platforms, adopted in whole or in part by the dominant parties and by independent political organizations. The first mention of inheritance taxes and social insurance, for example, is to be found in Socialist party platforms.

Many other issues developed by minor parties might be cited. The principle of the eight hour day found its first expression in the Labor Reform Platform of 1872. Opposition to the use of convict labor appeared in the Labor Reform and Greenback platforms of 1880. The income tax was urged by the Greenback party in 1880 and the Populists in 1892. The prohibition of child labor was asked by the Greenbackers in 1880. The attack upon monopolies was instituted in the same platform. The initiative and referendum and government ownership of telephone and telegraph systems were urged by the Populists in their platform of 1882.

The percentage of the total vote cast for minor parties in national elections from 1896 to 1916 is shown in the following table:

Party	1896	1900	1904	1908	1912	1916
People's (Populists)	1.63	.37		.19		
United Christian				.10		
Union Reform		.04				
Progressive					27.45	.23
Socialist-Labor	.27	.23	.25	.10	.20	.07
Prohibition	1.03	1.49	1.91	1.69	1.39	1.19
Socialist		.67	2.98	2.83	5.97	4.65

The vote cast for minor parties in the 1920 election totaled less than 5 per cent of the popular vote. The Socialist Party secured 919,799 votes, the Farmer-Labor party 265,411, the American Party (Texas) 47,689, the Socialist-Labor party 44,271, and the Single Taxers 3,932.

Continued from Page 6

hese facts are ample to prove the extent of the traffic in and r Toledo. Whiskey comes down in quantities more than suffi- it for all who buy, and the buyers are found in every class of citizens in enjoyment of an income of more than one hundred lars a month.

onditions elsewhere are no better, and in many places where ave been are worse, than they are here. In sixty-seven of these es I was entertained both publicly and privately by business n of the best class. I was hospitably entertained, and without ng into details let me say that in most places it requires a strong mach to be the guest of business organizations nowadays. I ak with exact knowledge.

One man cannot speak personally as to conditions in the entire intry. But there are ample indications from all sources that y are fairly uniform. In one day the news dispatches of last ek reported the shooting of officers attempting to impede rum nners on roads in five widely separated parts of the land. Week and week out the outlaw ships, now twelve miles out, maintain eir vigil off our ports. Liquor from Florida comes in orange ipments to every point in the north.

To date, enforcement, it is submitted, has failed. A President of e United States has officially pronounced it a national scandal, d it has grown worse since his death. It has no better chances r success in the future.

None know this better than the few honest officers in the group aintained for its enforcement. They freely admit it. They can- it do otherwise.

The business of bootlegging is backed by brains and money. is organized on an international scale. Competition has im- oved and will continue to improve the quality of the product. ccept among the very poor and in the slums of our cities, most licit liquor is now good and is getting better. Prices are stabil- ed and quoted as dependably as those of any other commodity. he service is good, and delivery is certain, attended with little sk for either dealer or consumer. Sales are effected in every ass of society, even to the highest circles at Washington.

The big men of the industry have never been caught. Convic- on of the go-betweens, men like Babe Johnson and Steve Mc- raw, means only their replacement by bigger and keener men ho profit by their mistakes. They are mere casualties in the reat army of crime.

Protected, as I have said, by elaborate and ingenious signal and telligence systems, it is only by accident that the vehicles of the rganized traffic are captured or even impeded on their journeys. he independents or outlaw bootlegger seldom escapes, the man the ring is seldom hindered.

Six years ago one brand of illicit liquor reached the Toledo arket. Five years ago one brand of Canadian beer entered the ade. Today there are nineteen brands of whiskey, and seven of eer and ale, freely on sale.

Store after store, handling hops and malt and brewers' and istillers' supplies, and nothing else, has been opened in Toledo. ll are operating today. Not one has ever been found in receiver- ip or bankruptcy.

Last month Alberta went wet, and within a month Ontario, the st of the Canadian provinces to test the joys of prohibition, will llow her example, making our northern border wet from coast coast. The triumphant wets of Windsor openly avow their tention to "turn Lake Erie into a bucket of suds," and it is as ertain as fate that the north-east winds will not be unaided in afting some of that foam up the Maumee.

On a hundred northern roads liquor caravans, preceded by ilot cars, protected by gun men, travel nightly with the regularity nd almost with the speed of a limited train.

With men in every class of citizenship, the best as well as the orst, eager for their product, ready to pay high for the goods nd service they require, this in every part of our country, it ould take an army at skirmish intervals along our ten thousand iles of border, land and ocean, to check the traffic, and the profits f the business would corrupt the army as they have all other gov- rnment agencies concerned.

The service is honey-combed with corruption. Honesty in an nforcement agent is so rare that it immediately attracts attention t Washington. Over half the force appointed since its organiza-

tion has been dismissed for misconduct.

Nor is corruption confined to the lowly. Anderson, leader of the self-constituted guardians of the well-being of the American people, convicted of embezzlement, forgery and perjury, is in Sing Sing. "Honest John" Kramer, choice of the Anti-Saloon League for the first Federal Prohibition Commissioner and duly appointed, escaped the penitentiary in Kentucky, for violating the Volstead Act, only by taking an immunity bath before the grand jury. Haynes himself, who not long ago officially informed the public that liquor running at Detroit had "dwindled to a trickle," did not hesitate to use the records of his department, and to appropriate information gathered at public expense to his private enrichment.

The poison spreads throughout the body politic. We find the Methodist Church, by its governing body in convention at Springfield, in one breath demanding our support of prohibition legislation, at the same time declaring the church should not support the government of the United States in waging war, even of right and in national defense. War by this country is waged only by virtue of an act of Congress passed pursuant to the war power granted in the Constitution. When so passed, it is as much a part of our law and Constitution as the Volstead Act and the Eighteenth Amendment or any other part. It requires a singular mentality to demand support for one part of the Constitution and express simultaneously an intention not to support any of it in time of war and public danger.

Successful denial, under the amendment, of some of our rights, has quickly and naturally been followed by attempts, thus far happily abortive, on others, and by efforts to nullify other provisions of our Constitution.

Entirely constitutional discussion of the wisdom of prohibition is styled treason. The spokesmen of the Anti-Saloon League deny our right to criticize their pet law or its enforcement. They have sought, in some cases successfully, to deprive of trial by jury, and have often and repeatedly conspired and co-operated with criminals, garbed in the habiliments of the law, to rob and steal, to blackmail the lowly and defenseless, to corrupt our courts. They have connived at the manufacture of evidence. They have snatched persons accused from their homes for trial before corrupt magistrates in foreign jurisdictions. They have searched and seized without warrant of law. They have encouraged the imposing of excessive bail for the enrichment of professional bondmen, and have fostered the imposing of extortionate and illegal costs and excessive fines for division among their corrupt official friends. Even today they seek through political pressure to nullify state prosecution of their criminal allies initiated by the activity and courage of our federal judge.

They have brought about a condition that induced that same high authority to recommend to his wife the employment of fire-arms in resisting attempts to search his residence, and from the bench to urge one victim of prohibition rascality to use a shotgun on the next officers who called.

Let us hope that if these activities have not been permanently suspended, the use of shotguns may become general, the sanctity of our homes preserved, and travel upon our roads unhindered.

When the amendment was adopted, the Reverend William A. Sunday prophesied concerning it as follows:

> "The reign of tears is over. The slums will soon be only a memory. We will turn our prisons into factories and our jails into storehouses and corncribs. Men will walk upright now; women will smile and the children will laugh. Hell will be forever for rent."

Prophecy fades in the cold light of facts. If this amendment has put any sign on hell it reads "standing room only."

As Americans we owe it to ourselves and our posterity to repeal and forever do away with the amendment and law responsible for current conditions, and put into the hands of reasonable and patriotic men, neither fanatics on the one hand, nor grubbers of money from human souls on the other, the solution of this disturbing issue.

I have confidence in the ability of the American people to bring this about.

Otherwise nullification is inevitable.
